"It aims at Eternity; and therefore is the only thing incapable of modes and fashions in its principles, which are founded upon the experience of all ages, promoted by the vast treasures of all the Great Monarchs, and skill of the greatest Artists and Geometricians, every one emulating each other; and experiments in this kind, being greatly expensive and errors incorrigible, is the reason that the principles of Architecture are now rather the study of antiquity than fancy."—SIR CHRISTOPHER WREN.

THE ARCHITECT AND CONTRACT REPORTER. A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

THE opening of the Manchester Ship Canal on Monday is an event which affects not only Lancashire and England, but the world in general, for as long as cotton is in universal use the increase of facilities for its manufacture is not a local affair. At the same time, the credit for overcoming the difficulties cannot be diffused. It was mainly through the courage of Manchester men the work was accomplished. As a canal seems, according to the popular notion, to be little more than a very long and very wide ditch, the obstacles which had to be overcome are not likely to be sufficiently recognised. In the first place, it was necessary to fight a Parliamentary battle that was almost unprecedented in bitterness against the representatives of rival interests. There was also a prejudice against canals which largely diminished the financial support. Then when the preliminary contests were gained and the contracts were let to Mr. WALKER, who was supposed to be the most competent contractor in the country for such an undertaking, his early and unexpected death not only gave rise to litigation but brought about disorganisation. Next came a financial crisis which must have been fatal to the enterprise if the responsibility for completing the canal had not been assumed by the Corporation of Manchester. That body and the shareholders who loyally upheld the directorate in a most arduous business may well share in the triumphal result which was witnessed on Monday.

EVERY visitor to Scarborough will remember the difficulty of communication between the north and south shores, and may have heard of various proposals for overcoming them. Steps have been at length taken to obtain an Act authorising the construction of a tunnel for carriages and foot passengers. It will start on the south side at the Foreshore Road, at a point about 12 yards east of the steps leading from that road to Merchants Row, and will proceed underground in a straight line in a northerly direction, terminating on the Royal Albert Drive, on the North Bay, at a point 100 yards west of the most easterly steps leading on to the beach. Up and down roadways and footways, ventilating shafts, offices, toll-houses and other buildings and shops will be constructed. There is a proviso that gunpowder or other explosives shall not be used in the course of construction without the consent of the corporation. The capital of the company which is incorporated by the Bill is fixed at 30,000*l.*, in shares of 10*l.* each, with power to borrow on mortgage 10,000*l.*, and the income will be derived from tolls, the maximum powers of the company in regard to which are as follows:—For foot-passengers, 2*d.*; for bicyclists, 3*d.*; for omnibuses, carriages, carts, or vans drawn by two horses, 6*d.*, drawn by one horse, 4*d.*; for horses not drawing, 3*d.*; and for every case, bag, or other package not conveyed by cart, except personal luggage conveyed by hand, and not exceeding 28*lbs.* in weight, 2*d.*. Double tolls may be charged by the company between 11 P.M. and 5 A.M. If in the execution of the works it is found necessary, to avoid injury, to underpin or otherwise strengthen houses and buildings within 100 feet

of the tunnel, the company may be required to do so by the owners or lessees. The time fixed for the completion of the works is five years.

ONE of the cases heard in the Queen's Bench Division prior to the holidays related to an arbitration case. Messrs. CUTTING & SON, builders, sued Mr. ARTHUR LOWE, of Saxmundham, to recover 435*l.* 8*s.* for material supplied and work done. Defendant denied his indebtedness, disputed various items of the account rendered, and set up a counter-claim for 42*l.* 12*s.* 10*d.* for breach of contract in failing to complete the work in time. The whole matter in dispute was referred to arbitration, Mr. COCKEREL and Mr. FIELD being appointed arbitrators, with power to select an umpire. They selected as umpire Mr. GRIMWOOD, who made his award to the effect that Mr. LOWE pay to the plaintiffs 115*l.* 2*s.* 8*d.* in addition to 185*l.* which he had already paid into Court, and two-thirds of the costs of the arbitration, the plaintiffs paying the other third. Counsel for the defendant applied to the Court to set aside, or refer back, the award to the arbitrator on the grounds that material evidence had not been heard, and that one of the questions referred had not been adjudicated upon in the award. The defendant swore he was never asked to produce an agreement between himself and the plaintiffs, which was material to his counter-claim, that the books of the plaintiffs were examined in his absence and without notice to him, and that whilst witnesses were called on the plaintiffs' behalf, none were called on his (defendant's) side. Counsel for plaintiffs said that Mr. FIELD was asked to attend when the plaintiffs' books were examined, but he did not do so, nor did he, as the umpire stated in his affidavit, produce the agreement referred to in support of the defendant's counter-claim, though asked to do so several times. The umpire also stated that he took the counter-claim fully into consideration in making his award. If Mr. FIELD did not choose to attend the examination of the books, and now did not choose to make an affidavit, that was no reason why the award should be sent back. The court dismissed the application with costs.

THE Salon, in the Champ de Mars, was exceptionally successful in 1893, as the total receipts exceeded the average of the preceding years to the extent of 10,000 francs. As the finances are encouraging, there is not much likelihood that the schism between the two societies will be closed. The International Exhibition of 1900, which will be held in the Champ de Mars, will not, as was anticipated, interfere with the artists' buildings; it is not unlikely that the Society will receive an impetus from the gigantic exhibition. At first the committee of the new Salon were not eager to display architectural drawings, for it was too well known they were used as screens by young people in the Champs Elysées, and entries in the catalogue were found to serve architects as well for advertisement purposes without a display of drawings. Subsequently a few drawings were admitted to the corridors and landings, and at the general meeting, which was held on Friday, an architect, M. DE BAUDOT, was elected a member of the committee.

NOTES ON THE NORMAN ARCHITECTURE OF WINCHESTER CATHEDRAL.

By CHARLES LYNAM.

VERY varied indeed must be the impressions of those who visit for the first time the immense pile of building known as Winchester Cathedral, placed as it is for the most part on a flat green sward and surrounded by trees of many years' growth, and accompanied by remains of former buildings which formed part of the original great *ensemble* of church and monastery, but are now superseded for the most part by the houses of the clergy of the present day. To some the great building may at first sight appear rather as a work of nature than of man. Varied in its outline as a great rock with massive projections, sloping sides, flat ledges, rising pinnacles and cavernous recesses all clothed in quiet grey, touched here and there with bright lights and radiant colours, toned as are the eternal hills by centuries of time and their attendant effects, it is not till after strong effort has been made to bring the mind to actual realities that it is felt that this great mass originated in settled design, symmetrical in a way and for a defined and special purpose.

This effort made, the mind next demands who originated the work before us and when did its conception first take root? Presently the eye begins to scrutinise its general forms and details and at once its great dimensions, its breadth and simplicity, and its stately grouping begin to disclose themselves. After further observation the tutored mind discovers that it is not in the multiplied refinements of such parts as the west end nor in the great straight-lined windows of its flanks that its power abides, but in its vastness, its general breadth and massiveness of wall, and withal in the simple refinements of light and shade and form in its recessed arcades, of repeated shaft and arch, and in the enrichment of the horizontal lines and boldly projecting corbellings. These are the sources of the sum of the infinite pleasures which, inside and out, this church has given through the ages to the devotee, the architect and the artist. Aye, and, with truth it may be said, to the modern excursionist also.

To whom belongs in the greatest degree the merit of this signal service to so many people? To some minds the name of the great Bishop WILLIAM OF WYKEHAM will first arise. Others will recall Bishops GODFREY, LUCY, EDINGTON, FOX, &c. But to those who have carefully surveyed the earliest part of the crypt, the north and south transepts and the central tower, and have examined the walls of the whole body of the church, such names will not be accepted as having furnished the real greatness of the design of this mighty building. Herein acceptable record comes to the aid of the inquirer, for Dr. MILNER, in his "History of Winchester," states, on authority which he deems to be trustworthy, that "in 1079 WALKELIN, whose genius and whose heart were equally capacious, undertook the greatest work which ever yet has been achieved by a bishop of this see, that of rebuilding the cathedral and adjoining monastery from the ground at his own expense and in a noble style of architecture." Dr. MILNER also writes:—"In 1093 the new church being rendered fit for Divine service, and the conventual offices for the reception of the monks, almost all the bishops and abbots of England assembled in this city to honour the solemn dedication of them, which took place July 15, being the festival of St. SWITHIN, the patron saint of the place." Here, then, is a clear statement that from 1079 to 1093 Bishop WALKELIN built a new cathedral at Winchester, and elsewhere it is stated that "barely one hundred years had elapsed since this sacred edifice had been newly built by St. ETHELWOLD, and that 'the very next day' (after the consecration of Bishop WALKELIN's church) the workmen began to demolish the ancient fabric, leaving nothing standing at the end of the year except the high altar and one porch."

It is to be accepted, then, that during the latter years of WILLIAM THE CONQUEROR'S and the early years of his son's—WILLIAM RUFUS—reigns, a church was here built "from the ground," and the main purpose of these notes is to examine, as far as a brief study goes, in a practical way, how much of the church finished in A.D. 1093 still remains.

Certain portions of the building present the well-known characteristics of early Norman work, and others those of its later development. Authentic record again informs us that within a few years of its erection by WALKELIN the central tower fell, and was rebuilt forthwith and finished about the year 1136. What may have been the cause of this disaster to the newly-built tower must, in the absence of all record on the point, be matter of conjecture. The faithful, at the time of its fall, are said to have attributed it to the fact that the interment of the wicked King RUFUS in its midst invoked Divine vengeance. The present Dean has explained that the building is placed upon peaty ground, and that this may have occasioned the ruin of WALKELIN'S tower. In these circumstances we learn that between 1079 and 1136 there was again a complete church of Norman character. East of the "crossing" the only remains now existing of this date are the lower part of a great shaft, which formed part of the original apse, now to be seen in Bishop GARDINER'S chantry, and fragments at the west end of the choir. But the crypt beneath the choir exists in its entirety, as do the central tower, the north and south transepts, the slype next the south transept (now used as a carriage-way), and the western front of the chapter-house. The crypt consists of a nave and aisles with apsidal east end, and has circular piers along its centre line. The north and south transepts have a nave with surrounding aisles on three sides—east, west and north. At the east end of the nave there are remains of its early arcade. The west front of the nave is of comparatively recent date, but it may be said that the aisle walls and the piers of the nave are more or less of Norman origin. In fact, their exceptional character is created by their Norman core. It is related that Bishop WALKELIN outwitted his cousin, the CONQUEROR, in the matter of securing timber for his buildings, by straining to the utmost a permission of the King that he might cut down trees in a neighbouring wood within a limited time, and that he employed all the labour he could command and wholly cleared the wood within the given time, much to the chagrin of the CONQUEROR, who however forgave the act on the Bishop's penitent petition. It is said that this timber was used in the fabric, and therefore it is a question whether any, and if so, how much, of WALKELIN'S timber roofing now remains. The observations on which these notes are founded did not go far enough to warrant any conclusion on this point. The scantlings of the present ancient timbers are of enormous size, and the framing generally consists of what is known as the framed rafter truss. These trusses consist of rafters, collars, cross diagonal braces, wall hammers and struts; their scantlings are about 10 inches by 10 inches; the framing is secured by oak pegs, and they are placed at 22 inches apart. There have been considerable repairs made to them from time to time, and now iron straps and bolts are frequent. To the nave roof there are massive tie beams a few inches above the summit of Bishop WILLIAM OF WYKEHAM'S vaulting. (No. 11.)

SKETCH No. 14.

The arrangement of plan in the transepts and the consequent treatment of this part of the building, both inside and outside, is the most remarkable feature in the whole structure, and it is unique in this country, there being no other cathedral where an aisle follows the gable ends as well as both the flanks of the transepts. This treatment gives to the interior of Winchester a superiority of design over every other in this particular. It is one thing to decorate a wall with what Mr. RUSKIN designates "a veil" of shaft and arcade, and another to gain the advantage of the recess of an aisle with its isolated piers and arch and vault. The contrast may be noticed by comparing this part of the cathedral

with that of Durham (No. 14) and St. Albans (No. 15). It cannot but be seen that the special feature here dwelt upon gives a more Romanesque character to this design, which is also evidenced by the lowness of the arcade that prevails here, and is to be seen also at Peterborough, Southwell and elsewhere.

The ambitious desire for height soon developed itself, and its gradual growth is seen at Romsey Abbey Church (No. 16), Christ Church, Oxford, the nave of Gloucester, and at the Abbey Church of Tewkesbury. The original idea started with a pier formed, as it were, as a piece of wall; then this changed into a circular or octagonal shaft, but cautiously strengthened, as at Oxford and Romsey (shown in No. 16); and lastly we have an isolated high shaft, as at Tewkesbury and Gloucester.

SKETCH No. 15.

SKETCH No. 16.

can hardly be said to be of ashlar-work, as they have not been smoothed by a tool, and the joints of the wall stones, both vertical and on the bed, are left rough, which in a great measure accounts for the broad mortar-joint. In the apse of the crypt the original wall has been pierced, and there it may be seen that the core is of flint rubble, with a large proportion of mortar. It may, perhaps, be assumed that the walls generally are built after the same fashion. The mortar is seen to be formed of gravel, sand and lime, and its present hardness is very remarkable, for even in the outside joints, where not covered by modern pointing, it may be seen to be harder than the stone, and not weathered in the least. The broad joints of the masonry are not confined to the

walling, but are used even where there are mouldings and enrichments.

The external horizontal strings and arches are the only parts which are enriched; of these examples are shown in No. 3. Internally there is almost an entire absence of these decorative features. They consist mostly of the billet mould, either single or double, and notchings of various forms. The capitals to shafts are of the simplest cushion form, but it is noteworthy that the abacus has a bead on the lower edge of its upper member, which gives to it a richness of moulding not observable elsewhere. The simple treatment of the capitals to the central piers in the crypt takes almost a Romanesque form, though perfectly explainable from the combination of the circular shaft and square springer. The same kind of capital recurs in the central circular shafts at the ends of the transept. The bases to shafts and piers vary in form considerably; those in the crypt spread at the foot more than those in the transepts, but all are of the simplest contour. The piers are masses of wall with central shafts to receive the arches of soffits, and nook shafts beneath the outer edge of the outer order of the arches. Of mouldings, except as strings and imposts, there are none. The architectural effect depends entirely upon arcadings of varying proportions, the massiveness of the walls always lending its aid to the result. In the flanking arcades of the transepts there is a strong peculiarity in the form of the arches, which are of the horse-shoe shape. It is a matter of speculation whether this was adopted for the sake of the form itself or with the idea of getting the arch opening as large as possible; in any case, and whether intentional or not, this increase of the width of arch over that of the piers is very effective.

In the wall of the south aisle there is a blocked-up doorway which originally formed an entrance from the north walk of the cloister, and on the west side of this doorway is preserved a fragment consisting of the impost mould and the springers of the arch, which have all the characteristics of the early Norman work (No. 18). The position of this bit of early work is extremely interesting, and its present existence is not to be noted without an expression of gratitude to those who have so long preserved it.

The precise lines of junction between the early and later Norman work are easily discernible after careful inspection; they occur, of course, in the vicinity of the central tower,

SKETCH No. 17.

and are to be seen both inside and outside the building. This feature and other details may perhaps be best explained by reference to the illustrations accompanying this paper.

SKETCH No. 2.

north transept (next the entrance to crypt) is shown; it is also of the earlier period, and from it will be noticed the simplicity of the treatment of this feature. It shows the

Sketch No. 1 is of the north-west pier of the north transept, showing its capitals of the single "cushion" form and springers of the arches and broad-jointed masonry, characteristics of the early work.

In sketch No. 2 the base of the southern pier in the

broad spreading square base as a foundation beneath the whole pier, the square lower member to the various shafts, and the shallow mouldings of the bases to the shafts.

Sketch No. 3 shows the variations in the capitals between the two periods, in contrast with sketch No. 1. In No. 3 the broad joint is substituted by a fine one, and

SKETCH No. 3.

the masonry itself is smooth by tooling and more regular; the division in the cushion capital is seen in the shaft to the soffit arch, and the edge of the main arch is boldly moulded instead of being left sharp as in sketch No. 1. Here also is to be seen perhaps the first bit of original carving executed in the whole of the cathedral, in the scrap of foliage filling the lower space of the divided cushion of the capital. Nowhere else does even as much as this fragment of the carver's chisel appear in any part of the building, till this piece of the reconstruction after the fall of the tower was put up. It will be noticed also that the section of the abacus mould has been altered by the omission of the bead between the upper and lower member, which is always present in the earlier work.

The junction on the outside between the early work of the west side of the south transept and WILLIAM OF WYKEHAM's south aisle is very clearly marked, and is roughly

SKETCH No. 18.

indicated in sketch No. 18, where the masonry of the early and late periods is clearly distinguishable.

SKETCH No. 5.

There are various evidences of deviation from first intentions as to design in several parts of the building. In the interior this is apparent in No. 5, in the north transept looking north, where the abrupt termination of the wall shafts above the face of the end arcade points to a decided case of this kind. It may be that the desire for the effective arcade treatment in the pier between the clere-

story windows governed this alteration, as it could not have been carried out if the design below had been followed.

The exterior, No. 4, showing part of the east side of the south transept, discloses a very material deviation in design. The southern bay of this flank is altogether different from the others, and in itself the existing arches indicate a material change of purpose in the designer. This bay would appear to be of the same date as its immediate neighbour northwards, the characteristics of which conform to those of the earlier period generally, but the difference of treatment is very decided. Architecturally the northern bays are a great improvement on this southern bay. In considering the differences in this place it should, however, always be borne in mind that it was the constant habit of the Norman builders to add mouldings and carvings to plain constructive members from time to time. No. 4 also shows that the original roof of the eastern chapels of this transept rose to the underside of the string-course below the clerestory windows, and followed the raking line now defined by the weathering in the south wall. The arches above the present roof belong to the ground floor arcades of the transept. To which period the corbel tabling belongs is an interesting question. If it may be assigned to the earlier work (which is probable), it is the earliest feature in which carving was introduced, and in that case it was not left for the later Norman builders to introduce the carver's art, as previously suggested.

SKETCH No. 4.

No. 6 is a corner of the present ringing-room, which originally formed a lantern, seen from the inside of the church, and shows the progress made in the details of the later work. Here the moulded chevron or zigzag is freely introduced, though not seen anywhere below this level, and the grouping of the shafts is very beautiful. This must have formed a charming storey, as seen from below. The exterior of these windows is also very artistically enriched, the shafts being pleasingly elaborated by a chevron treatment, while the grouping of the mouldings is delicately designed.

SKETCH No. 6.

No. 7 shows part of one side of the interior of the upper stage of the tower, and displays the true artistic feeling which prevailed throughout the Norman period. The walls are increasingly pierced by openings for the sake of lightness in the upper parts; the details, though simple in character, are, even in this remote part of the building, en-

riched to a considerable extent, as may be seen in the double billet moulding encircling all the arches of these many openings. The timbers here form the roof of the tower, from the top of which very pleasing views are seen on all sides :

SKETCH No. 7.

one towards St. Catherine's Hill, with its rampart of an early camp, is faintly indicated by No. 8, the College of WILLIAM OF WYKEHAM being in the foreground.

SKETCH No. 9.

No. 9 is a view of the crypt looking south-west, and shows the low central circular pillars with their square bases and abaci, and the radiating ribs meeting the form of the apse. Except in the mouldings of base and cap to circular pillars, and the slightly-projecting impost of the wall piers, all here is as simple as it could be, the groining being of rubble; but withal there is skilful design and construction throughout, showing that master minds governed the erection of the structure. Well that it was so, seeing how much depended upon it for support.

SKETCH No. 10.

with a dividing arcade, as seen in this sketch.

No. 11 shows the interior face of the upper part of the south wall of the nave, above the groining of WILLIAM OF WYKEHAM. In it is seen the original wall shaft of the early Norman nave, and hereby it is again evident that WILLIAM OF WYKE-

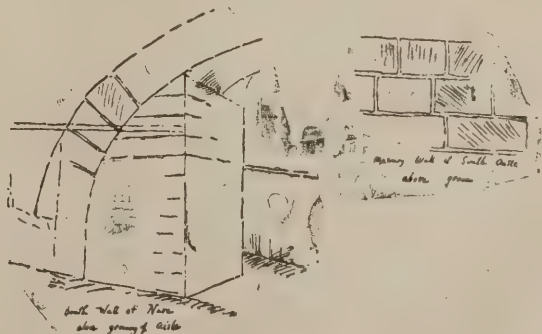

SKETCH No. 8.

HAM did not wholly take down the walls of the nave. On this sketch is also shown a bit of the masonry of the Norman work of the central tower from the north-west angle.

[SKETCH No. 11.]

No. 12 is taken from above the vaulting of the south aisle, showing the wide jointed masonry, the early tooling, and also the arch of the early triforium.

SKETCH No. 12.

No. 13 is a view of the gable of the north transept, showing its three heights of windows, the lower lighting the ground arcade, the middle corresponding with the triforium range, and the upper with the clerestory. The flank has the lower line of windows, as in the gable; the small one above lights the triforium, and the clerestory lights are insertions of Perpendicular date, as also is the central circular window in the gable. There is a stair turret at each of the extreme angles of the gable.

Though barely forming part of the subject of these notes, it would scarcely be possible to leave this cathedral without

some jotting of the remarkable font shown in No. 17. It is now placed on the north side of the nave, and the

SKETCH No. 13.

present Dean assigns it to the date of about 1200, and exhaustively gives its history in a paper lately read before the British Archaeological Association at Winchester.

Norman architecture is nowadays regarded by most people as entirely a thing of the past, out of which nothing is to be turned to account for present use, and perhaps its main characteristics are too great for application in this generation; but it

own, and those who neglect to study it suffer an untold loss. It would be a charming undertaking to set forth with pen and pencil the wondrous things which the builders of this period accomplished in this country in a little more than a hundred years, and really to show how much of their extraordinary work still remains to us (though it has become the fashion erroneously to consider that Norman work is always ready at any moment to

SKETCH No. 17.

come down with a run). But what time has an architect with the responsibilities of a practice on his shoulders for these things? Except for a snatched holiday of short duration once a year, his every thought is necessarily of current business, not of past achievements; but who that has a soul for real building, when everything was genuinely of the best—real in purpose, art, construction, and labour—does not often yearn for a quiet hour amidst such work of the far-distant past as the Normans built in Winchester Cathedral?

GERMAN PAINTING.

WE have noticed some of the remarks on architecture in the last address of Sir FREDERICK LEIGHTON to the students of the Royal Academy.* It is no less a duty to consider what was said on the subject of painting.

The defects of German painting, according to the President, arise from its being "primarily ethic in its complexion." Hence it is "wanting in the instinct of congruity and fitness, the sense of rhythm, and a perception of the value of restraint and repose." Music, not painting, is the endowment of the race, for "it is not on waves of light but on waves of sound that it has been given to Germans to carry us into the purest region of æsthetic delight."

In our notice of the President's criticism on German architecture we endeavoured to explain that the architects did not always err through a deficiency of gifts. There was, among other controlling causes to which they were subject, a national spirit which had to be obeyed, and which would not tolerate arrangements for the sake of effect if they entailed any diminution, even imaginary, of the dignity or self-respect of those who used the buildings. May we not also say that German painters were not more free than the architects? It is not to be supposed that either architects or

painters were coerced. They shared the prejudices of their contemporaries, and were willing to sacrifice art itself to the claims of duty. It will be said that artists have no right to consider themselves as subjected to the limited conditions of time and place. They ought to be citizens of the world, or rather should belong to a region where only the beautiful was valued. "My library," said PROSPERO, "was dukedom large enough," and it may be held that a painter whose world is not confined by his studio walls, or the limited field his vision can seize when representing nature, is not worthy of the name. In one sense that theory may be true, but as everyone suffers whose life is devoted to abstractions, on the other hand an artist must gain when he shares in the joys and sorrows of his fellows. The German artists were always children of their time, and from their mental qualities they appear to have been more sensitive than the rest of their countrymen to the influence of everything that was likely to affect their country for weal or woe. A remarkable example of it was seen in the character of the artistic revival which was attempted about sixty years ago. A predecessor of Sir FREDERICK LEIGHTON in the presidential office, in referring to it, says:—

The efforts to create a new style of art in Germany in the beginning of the present century were intimately connected with the struggle for political independence. The cathedrals and churches on the Rhine had been more or less desecrated and plundered, and the pictures by the early German masters dispersed and sold. The gradual recovery of these ended in the formation of collections of such works; this led to a higher appreciation of their merits, indulgently seen as they were by patriots anxious to restore and maintain all that especially characterised the German nation. With men thus inspired, the connection of such feelings with the religion of their forefathers was obvious. German artists and writers again, who visited Italy, dwelt on the relation that had subsisted between Germany and Italy before and since the revival of letters, not only in politics but in the arts. The tower at Pisa, the church of St. Francis at Assisi and other buildings had been erected by Germans, and it was remembered with pride that the new life of Italy had been kindled chiefly by the genius of the northern nations. The spirit of the Middle Ages was thus in a manner revived, and the Germans looked with complacency on that period when the Teutonic nations, unassisted (as they assume) by classic examples, produced a characteristic style of architecture, and developed their native feeling in the arts of design and in poetry. In those ages architecture, the most necessary of the arts and therefore the first in date, had time to develop itself fully, especially in the north; but before painting could unfold itself in an equal degree, the thirst for the revival of classic learning and the imitation of classic models prevented the free formation of a Christian and national style. The early specimens of art which were most free from this classic influence were thus regarded with higher veneration, and the Germans of the nineteenth century boldly proposed to throw aside all classic prejudices, however imposing, and follow up the imperfect beginnings of the latter Middle Ages in a kindred spirit. This general aim connected the early efforts of Italian art still more with those of Germany, and the German painters who visited Italy recognised the feeling that inspired them in all works which were supposed to be independent of a classic influence.

The degrees in which this spirit has prevailed have naturally varied. With many the imitation of the earlier masters soon gave place to a juster estimate of the general character of the art. The antique has even, to a certain extent, reassumed its empire; but, on the other hand, some of the best German artists have unflinchingly maintained the general principles above described, even to the present day; indeed not a few had at first returned to the old faith, and had imbibed with it a still deeper attachment to the spirit of the early painters.

It is necessary to bear these facts in mind in order to understand the particular aim which many (perhaps the best) of the German artists have in view. The veneration for the general spirit which prevailed at the revival of art was accompanied by an imitation of the characteristics and even the technical methods of the early painters.

It will be said, of course, that the Germans would have done better if they had divorced nationality from painting, but that would signify the transforming of themselves into nondescript beings, which is about the last ambition of the Germans. They try to be in all things true to their own nature, and if their spontaneous action leads them to error, sooner or later a remedy will be found.

A memorable endeavour to obtain that remedy took place in Munich many years ago. The intellectual omnivorousness of the race was exemplified in the reign of King LUDWIG. Instead of keeping to early German and early Italian art, all the styles of painting were turned to account partly for the embellishment of the Bavarian capital, but mainly for the education or development of the powers of the artists. The outsides of buildings were painted as well as the interiors, the production of stained-glass became a public duty, copies of foreign buildings were set up, and sculpture

* *The Architect*, December 15 and 22, 1893.

was attempted on an unprecedented scale. Some of those works are no longer prized; the exterior frescoes especially have suffered, and have made foreigners believe that the endeavours of the king and the artists were only a waste of energy. That is only a short-sighted view. In spite of the loss of qualities which made them appear brilliant to the eye, the Munich works merit the most sympathetic appreciation of the world. They are the

particular artist accepted as the representative of German painting. We may allow that OVERBECK was faithful to the early Italian, if not the early German ideal, although in his faces there is a psychological significance which essentially belongs to the nineteenth century. But if the works of CORNELIUS, HESS, KAULBACH, SCHNORR and others are compared with OVERBECK's, although there may be correspondence in the subjects, it will be found that the treat-

THE GENIUS OF PAINTING. By Wilhelm von Kaulbach.

evidence of enthusiastic and self-sacrificing efforts in training in order to reach an elevation in art which previously had not been attempted. If sceptics will say they are only signs of the failure of a roundabout process which was inspired by vanity, it is the expression of the same truth in a different manner.

One of the consequences, however, was the overthrow of the principle which would make a particular school or a

ment is differently inspired. We have no desire to advocate such indifference to a common standard as is witnessed in Paris exhibitions, where libertinism appears as impressionism, naturalism, individualism and so on; but among the greatest blessings which fell on German art was the failure to establish a pet style under Court favour. In the decoration of the Munich Palace under the eyes of LUDWIG himself independence asserted itself.

It might be supposed by people unacquainted with the subject that German painting in general comes under Sir FREDERICK LEIGHTON'S censure from being "primarily ethic in its complexion." The truth is, an exhibition such as may be seen in Berlin or Munich is as varied as one in Burlington House. The independence of selection and feeling which was not to be controlled by all the king's efforts or all the king's men half a century ago is as strong as ever. Instead of ethic being paramount it is sometimes too rigorously kept down. But, after all, is the quality so pernicious? A German painter naturally thinks of German patrons and German critics, and if they desire an ethic element in a picture (which the painter is very glad to introduce) are they to be told it must be kept out because it may interfere, according to English and French notions, with the sense of rhythm? Is there no compliance with the requirements of the market in England? As long as the arbiter in art among us is the dealer, it becomes us to hesitate before setting up canons of æsthetics for the edification of other men. It will be time enough when self-sacrifice for the sake of principle prevails in England to set up as moralists. But when a picture is "ethic in its complexion" is it necessarily defective or inartistic? We are told it is possible to find sermons in stones and books in the running brooks. Do the stones and the water become less interesting on that account, and are representations of them diminished in value if they give rise to sermons and books? The truth is, the admiration of the simplest thing is a complicated affair when it is analysed. PETER BELL'S condescending recognition of a primrose by the river's brim was in its way rather ethical. The case as regards painting was expressed in two or three sentences by Sir JOSHUA REYNOLDS. In his fourth discourse he said, "The value and rank of every art is in proportion to the mental labour employed in it or the mental pleasure produced by it. As this principle is observed or neglected our profession becomes either a liberal art or a mechanical trade. In the hands of one it makes the highest pretensions as it is addressed to the noblest faculties; in those of another it is reduced to a mere matter of ornament; and the painter has but the humble province of furnishing our apartments with elegance." In other words, the disregard of the ethic complexion produces ornament rather than pictorial art.

As we are allowed to give an illustration from one of the most remarkable examples of the German ethic class, we can judge whether the mental labour advocated by REYNOLDS will frustrate our enjoyment. KAULBACH has symbolised his notion of painting in the figure of the genius of the art. The subjects of the panels borne by the attending cherubs suggest that at the time he was under the influence of the ideas which EASTLAKE has described, and held early Christian art in reverence. The genius, as we see, stands above the world and glances from it towards heaven. It was such a position as KAULBACH himself assumed when he attempted to paint a philosophy of history. From his point of view he could not be much concerned with individuals. He saw man as part of a mass. He therefore was the painter of vast operations which changed the character of the world—*The Destruction of Babel and The Dispersion of Mankind, Homer and the Greeks, The Destruction of Jerusalem, The Battle of the Huns and Romans, The Crusaders, The Age of the Reformation*. He did not neglect the influence of the individual, for, supplementing his series, he painted figures of great law-givers, MOSES, SOLON, CHARLEMAGNE, BARBAROSSA. The mind of KAULBACH, however, gravitated towards universals rather than particulars in art.

The worst allegation which can be brought against any of the large works of the series is that they embody not one but several dramas. *The Battle of the Huns* not only represents a fierce struggle on earth, but the old enemies are supposed to have risen from their graves and to have grappled with each other in the central blue. In defence of the picture we may ask, Could racial hatred, which, as we know, still survives, be suggested in a more effective way? Vast bodies of men can struggle against each other for a principle or under compulsion, and afterwards retain no animosity. But in such a battle as KAULBACH depicted the enmity was inherited from forgotten ancestors or was an instinct, and it would be useless to represent its effects by the ordinary rules for battle pictures.

In *The Destruction of Babel* it is also objected that there are many historic events brought before the spectator. From the first days of painting, attempts have been made occasionally of the same kind, by connecting in some way past and future actions with those which are represented, or to bring things which were remote into relationship with those that are present. The several scenes of *The Destruction of Babel* form in reality a sort of chain of events, a correlation of consequences, which cannot be detached without destruction of the magistral idea of the artist, by means of which we see—

Large elements in order brought,
And tracts of calm from tempests made,
And world-wide fluctuation sway'd
In vassal tides that followed thought.

It cannot be too well remembered that a work of art is not intended for the enjoyment of artists or of critics alone. The public must also be considered. Now any one who has observed the pleasure with which KAULBACH'S mural paintings are explained by parents to their children, or by groups of students who are competent to grasp the admirable method on which his arrangement is based, will grant that there must be a peculiar interest in the series of works. The wall-paintings are not passed like the ancient and modern works which are to be seen in annual exhibitions or in public galleries. They not only attract attention, but they reward it, for the endeavour to understand the aim of the author unfolds the expectation of new possibilities for painting whenever artists will cease to be satisfied with the production of what REYNOLDS calls a "mere matter of ornament." In no country of Europe is there less regard for the ethic in art or literature than in France. It is well known, however, that the most competent judges in that country admitted the grandeur of *The Destruction of Babel* when the cartoon was exhibited in Paris in 1855. M. MAXIME DU CAMP declared that in KAULBACH were, above all men, united in the highest degree "l'idée et la forme." After pointing out the grandiose thoughts, the elegance and truth of the forms, the aspiration towards the ideal, the originality of treatment, M. DU CAMP boldly came to the conclusion that there was not one artist in France who was so capable as KAULBACH to treat biblical subjects, or to expound them with such exalted illumination, and if he could have the awarding of an extraordinary medal for the "plus fort" artist of the age he would without hesitation select the German painter as the man. After that judgment KAULBACH'S works are not likely to be affected by objections to their ethic principles.

A CELTIC CROSS.

WHILE a grave was being opened in the churchyard of Abernethy, Perthshire, the sexton, with the aid of the Parochial Board inspector and others, unearched a stone slab bearing on both sides an incised cross of Celtic form. The stone is sandstone (conglomerate), 27 inches in length by 21 inches in breadth and $7\frac{1}{2}$ inches in thickness. The obverse side has carved on it the shaft of a cross the full length of the stone and $7\frac{1}{2}$ inches in breadth, with Celtic work upon it, but so weather-worn as to be scarcely visible. Unfortunately, it is broken at the semicircular hollows where the shaft joins the arms, and the part containing the arms and the summit is not yet discovered. At the part of the stone near the semicircular hollows the evidences of tracery are very clear. The form of the shaft now discovered gives the irresistible impression that if the upper part of the large cross could be found the whole would resemble the cross at Haw Rhill, Alloa (Anderson's "Scotland in Early Days," p. 92). On the reverse side is a cross about 16 inches in length and 7 inches from arm to arm, with traces of what may be oghams near it, weather-worn. The stone slab was found at the foundation-wall of the parish church, demolished in 1801. It was one of the oldest Celtic churches in Scotland and stood near the old Celtic round tower in the churchyard. A picture of it is preserved in Grose's "Antiquities," and its origin is lost in antiquity. It has been, on very substantial grounds, supposed to be the church spoken of in the Pictish Chronicle as the work of a Pictish king. It is said that "Gartmaidh built the church of Abernethy 225 years before the church of Dunkeld was built by King Constantin." At the foundation-wall of this church the present stone was found. According to Dr. Skene, the church supplanted the former one, built as a result of Columba's preaching among the Picts, which again, according to the same authority, supplanted the church of wood and wattles—the result of St. Ninian's preaching among the southern Picts, who had their capital at Abernethy.

THE WINTER EXHIBITION.

THE first picture in the Winter Exhibition at the Royal Academy that is likely to compel the attention of the visitor who follows the order of the catalogue is *The End of the Harvest*, by the late G. P. CHALMERS. If it had been painted by MILLET it would be popularised throughout the world by means of etchings. It is sombre, solemn and symbolic. The night cometh and a storm is also approaching, but in the darkness two women are struggling against fate by labouring. Their toil is nearly complete, for the three sacks are almost full. In the rear is a weird line of trees. *The Plough*, by the late FREDERICK WALKER, is hung near CHALMERS'S work and is worthy of the companionship, but as it glows with the warmth of the setting sun while brightened by the rising moon, it is less pessimistic in intention, less suggestive of the dreariness of life than the Northern painting. *The Trossachs* must have been one of TURNER'S best interpretations of Scottish scenery, and probably was crowded with fine detail, but now there is so little left of his characteristic handling it might be ascribed to an inferior artist.

PHILLIPS'S pictures are valued so highly in the market—owing, no doubt, to the diplomacy of dealers—the least hesitation about acknowledging their greatness is put down to incompetence. The *Early Career of Murillo* undoubtedly contains some excellent heads, which are painted with breadth, but the composition is unskilful, the colours are unsatisfactory and clayey, there is no sign of thought about the arrangement, and, above all, the picture is not suggestive of Spain or a transaction which occurred in the open air. With all its palpable defects there is far more “go” about ETTY'S *Pluto and Proserpine*, for the painter has expressed his intention, which was to represent the suddenness of the appearance of Acheron's dusky monarch and his irresistible abduction of the daughter of CERES. We suppose it was painted in Buckingham Street, Strand, but there is less of the studio stuffiness about it than in the picture by the man who was popularly supposed to set up his easel before the scene he was to represent. The owners of PHILLIPS'S costly pictures are wise in secluding them, for when one of them appears in public it reveals that the artist's elevation above so many of his contemporaries was mainly secured by the machinery of trade.

There are several portraits in the first room by SHEE, OWEN, T. PHILLIPS, HOPPNER and COTES. As they were all Academicians we suppose their efforts are entitled to admiration, but it is not easy to attain that end in front of the works on a wintry day. Most of the portraits that await the visitor in the first room would be chilling at any time. GAINSBOROUGH'S *A Page* is another Blue Boy, but, unlike Master BUTTALL, he is over-nervous and might be a girl in a ballet. The artist's treatment emphasises the weakness. Among the landscapes are a riverside scene, a waterfall and glen with a rainbow, by J. S. COTMAN, both admirable; two by DAVID COX, whose work in oils is not abundant; an early and quiet scene by CONSTABLE, an effective *Harvest Shower* by W. COLLINS, and views by WILSON, NASMYTH and CROME. The *Young Anglers*, by GEORGE MASON, gives no revelation of his genius, but the *Wayfarers*, a modern BELISARIUS and boy, by FREDERICK WALKER, is a masterpiece.

There is not much need of a catalogue for the pictures in the second room. The Dutchmen who, as usual, are installed in it were, like Greek architects, in the enviable position by which success could be gained without any harmful exercise of the imagination. There was no need to invent new subjects. A little variation was all that was needed to distinguish one *Landscape with Cattle* from another. Let a man once succeed with a group of smokers or toppers, a canal scene, or a party of soldiers, a piece of still life, an interior of a building, a family merrymaking, a stormy or calm seascape, and he was endowed by his countrymen with a sort of perpetuity, for he could go on with repeating the subject as long as he liked. When a great artist like REMBRANDT endeavoured to manifest his versatility he suffered. The Dutch patrons did not care to undertake the exertion which was necessary if novelties were set before them.

One year's exhibition of the Dutch school is therefore marvellously like the one which preceded it, and is not likely to differ much from its successor. To say that

examples are to be seen this year by the VAN DE VELDES, BERGHEM, TENIERS, TERBURG, CUYP, SNYDERS, JAN STEEN, VAN OSTADE, HOBBEEMA, WOUVERMAN, RUYSDAEL, BRAUWER, will be sufficient to suggest the character of the collection. Some pictures are in excellent condition—such as the brilliant *Garden Scene*, by PETER DE HOOGE, and the *Dutch Interior*, showing a room lined with Venetian leather. The *Shepherds and Herdsmen Resting at Night*, by REMBRANDT, and his pupil EECKHOUT'S *Portrait of a Man*, which is worthy of the master, are among the novelties. They belong to the Dublin Gallery, and are evidence that treasures may still be secured at most moderate prices by those who have the sense to avoid relying on the judgment of dealers.

The collection in the large room starts with HOGARTH'S *Wedding of Mr. Beckingham and Miss Corbett*, which took place in Bishopsbourne Church in 1739. The artist found little difficulty, as all the world knows, in making an amusing subject of hymeneal rites, but in this case his orthodoxy and conservatism made him sedate. The parson and his clerk were evidently adapted for caricaturing if the artist did not restrain his hand. His imagination asserted itself in the Cupids he introduced around the chandelier, that are delightful. What appears to be most remarkable in this work, as in so many others of HOGARTH'S, is the freshness of the colours. GAINSBOROUGH'S *Queen Charlotte* is not quite such a failure as the majority of the commissions for recording lies on canvas. In his *Hon. Mrs. Thicknesse* he was hampered by the difficulty of suggesting that the lady could perform on the violoncello as well as the mandolin, while her robe being of a costly kind, not a frill was to be concealed. With *Charles Frederick Abel* the skill as a performer could be taken for granted, so it was only necessary to represent the composer as deriving inspiration from gazing on the spectator. In his *Sleeping Nymph and Satyrs* ETTY wished to compete with TITIAN and RUBENS. When he completed it as a diploma picture we may assume he thought, like many other painters, that he ought to be merciful towards the “deposits,” past, present and future, rather than just to himself. TURNER'S *Van Tromp's Shallop*, which dates from 1832, is in a condition which enables the spectator to realise that the waves have motion and power.

We next meet with a variety of Italian works. *The Flight of Europa*, by VERONESE, is an able version of the story, all the figures being apparently in good condition. The two views of Dresden, by BERNARDO BELLOTTO (IL CANALETTO) are preferable to many of his Italian views, and they reveal that he could paint a better landscape than his uncle. TITIAN'S *Mother and Child* must have been delightful at one time, before the meditative looks of the woman were obscured. The *Holy Family*, by SEBASTIAN DEL PIOMBO, bears out the theory that the artist was aided by MICHEL ANGELO, for the figure of the Virgin appears akin to the Sibyls. Whoever painted the *Portrait of a Senator*, ascribed to RAPHAEL, was a master, for it must be considered as the finest work of the class in the exhibition. In PARMIGIANO'S *Holy Family* we have not only figures that have gone through a process of extension, but are novel types. The background is excellent. VANDYKE'S *Andrea Spínola, Doge of Genoa*, was a difficult work. The grandee's head and face were small, and it was necessary to represent him in the crimson robe of office with a large ruff. The painter has succeeded by accepting the difficulties and meeting them all in a thorough way. Undoubtedly there is an excess of red in the picture, but the fascination which comes from the scrutinising eyes and the subtlety of the whole face affords compensation. VANDYKE was on his metal before such a man, while probably he despised the neighbouring subject, *James Stuart, Duke of Richmond and Lennox*.

It is a pity the Academicians do not treat the world with an exhibition from which REYNOLDS, GAINSBOROUGH and TURNER will be absent. The novelty would be welcomed. By the first of the Presidents are portraits of Lord AMHERST, Mrs. JELF POWYS, Lady SUNDERLIN and the Marquis of TAVISTOCK. GAINSBOROUGH'S *Lord North* gives a new version of the good-humoured statesman, and his *Mrs. Robertson* would be more delightful if we could be assured the painter was not engaged in a scheme to convince the Prince Regent that “Perdita” was always thinking of His Royal Highness. TURNER'S pair of views in

Petworth Park will give rise to general disappointment. The subjects were worthy of his best efforts, and as far as can be judged he was unusually careful in treating them. The lovelier has been unhappily transformed into a monochrome, and the harmony of colours in the other is disturbed. *The Wreck of the "Minotaur"* manifests TURNER's power of a supreme sort in dealing with the sea in its wrath, but how a man whose spirit was equal to such epic efforts could paint the *Chain Pier, Brighton*, and the row of blocks or houses near it as if he enjoyed the unbending stiffness of the builder and engineer, is one of the mysteries of art. Apparently the subject was prescribed to him at the same time as the Petworth scenes and the *Chichester Canal*, and TURNER felt he was bound to accept the commissions unquestioned, and to make the best of them.

The oldest works of Italian, Flemish and German schools are as usual in the fourth gallery. The first is a *Virgin and Child*, described as by GIOVANNI BELLINI. It belongs to Dr. RICHTER, and there is likely to be authority for the authorship. But from the style, it has far more affinity to a very early work of the Florentine school. The face of the Virgin is almost Byzantine. The drapery is in stiff, conventional folds, and the edge of the blue robe has an embroidery made up of mysterious lettering. Beside it is another *Virgin and Child*, by GIOVANNI BELLINI, from Lord NORTHBROOK's gallery. It is Venetian in style. There is no idealisation of the Virgin, whose face seems to be a portrait of a comely girl; the drapery is almost without a fold, and the whole picture is as genial and homely as any of MURILLO's. We must expect puzzling contrasts when Old Masters are brought together, but rarely is one so remarkable as in the present case. GIOVANNI BELLINI in the course of his long life often modified his manner, but his existing works do not warrant the belief that he passed through the extremes of which the two Madonnas are the signs. What seems to be a more characteristic example of the master is the *St. Jerome*. It represents one of those rocky regions which at one time were supposed to be conventional, but are now said to be dolomitic. The saint is dark brown, "the shadow'd livery of the burning sun," which appears more Moorish by the scanty white drapery. Among the rocks is a white rabbit, which at once attracts attention.

In the *Virgin with Angels*, by FRANCESCO DI GIORGIO, the Divine Child has very white hair, which is novel. The Virgin's robe is richly embroidered, and the background is elaborately gilded. In MANTEGNA's *Virgin and Child*, the face of the Virgin is of a sorrowful cast. She wears a brooch of four pearls, arranged crosswise, to which CHRIST points. Above is a wreath of leaves and fruit. *The Saviour*, by CIMA DA CONEGLIANO, is a full-length figure in a red robe, corresponding with one in the Dresden Gallery, which used to be ascribed to GIOVANNI BELLINI. FRANCIA's *Virgin and Child* suggests the goldsmith by the beautiful form of the dish on which fruit is presented by an angel. CARLO CRIVELLI's picture would be interesting if it were only for the fly represented on the balustrade, which recalls many a legend of dexterity. The *St. Sebastian*, by ANDREA ORCAGNA, is a departure from the accepted type, for instead of a wounded nude youth we see a very resolute, bearded man, in the prime of life. He is clad in a dress that is adapted from what was worn in Florence in the fourteenth century, and carries the arrows in his hand. Probably the painting is a portrait.

The two "cassone-fronts," by PAOLO UCCELLO, suggest what the pride, pomp and circumstance of glorious war signified in the fifteenth century. Imagine the King of Diamonds opposed to the King of Hearts, while their Majesties the Kings of Clubs and Spades await the issue to determine what course they will take, and that the general camp, pioneers and all, are as gorgeous as their lords, and a faint notion may be obtained of the two pictures in their pristine state. The Field of the Cloth of Gold must have been commonplace beside the battle-scenes at Anghiari which UCCELLO has depicted. The pair are a wondrous record of heraldry and other decoration as well as costume, but the military tactics are incomprehensible.

The two *Scenes from the Life of San Zenobio* are long panels representing miracles performed by the bishop. The treatment is traditional. Laymen and women exclaim

with wonder, while acolytes and servitors are unmoved, as if accustomed to miraculous deeds. They afford a little knowledge about some customs of the fifteenth century. For instance, the hands of people who were supposed to be demoniacs were bound before they were freed from the spirits. What is most remarkable in both are the architectural backgrounds. Every line is as carefully ruled, the curves are as accurate and the ornament as complete in detail as if the paintings were to be employed as models by builders. It is only in an age when architecture is esteemed that so much exactness would be tolerated. It would be ruin to a modern painter in England if he made a background of that kind so obtrusive. The two pictures are ascribed to BOTTICELLI, and they might have been painted when he played, as it were, to the gallery. But the SANDRO who can move those who have grown wearied of the majority of masterpieces is seen in the small *Virgin and Child with St. John*, which is the gem of the exhibition. It is one of those in which a balustrade is introduced as a seat, and the artist has formed the front with bronze panels which almost appear to be efforts to realise a Greek work from a description. The Virgin holds CHRIST on her lap. On her head is a transparent veil which, like all parts, is finished with loving care. She gazes thoughtfully on the BAPTIST, who kneels below and with clasped hands appears to express affection rather than reverence. In this picture there is no trace of SANDRO BOTTICELLI's vehemence or the uncertainty which came of conflicting ideas. Intended probably to be hung before a *prie-dieu*, it seems to have been painted in a humble spirit and has the simplicity, refinement and pathos of a hymn.

This year the *Madonnas* are numerous, and make a sort of sanctuary of the gallery. There are two from the Northbrook Collection, which deserve attention because they are evidence of a time when painters desired to surround the noblest subjects with whatever was best on earth, and therefore employed architecture. One is by MABUSE, the other is probably his work also. In the former there is a somewhat original arrangement. According to the catalogue, the throne on which the Virgin is seated "is of marble, with conch-shaped canopy and semi-circular back; the foot-pace of the throne rests on four brackets, between which are panels of bronze with representations of DAVID and GIDEON." It would take long, however, to fill up that outline, for every part displays most refined detail. In the companion work the alcove in which the throne is placed is no less elaborately worked out, and what tapestry, ornamentation, drapery, or other arrangement would be equally dignified and worthy of the figures that are depicted? In the *St. Jerome* of ANTONELLO DA MESSINA we see the Father reading on a platform in a comfortable study, which is approached through a hall having very slender columns; the departure from the ordinary treatment will be approved. The *St. Giles*, which is Netherlandish, is a welcome visitor from its novelty. If St. HUBERT was the patron of the chase, St. GILES has a claim to be taken as the patron of the chased, for we see him protecting a fawn by allowing his hand to be pierced by the hunter's arrow. As a foil to the earnestness of the early works, there is an *Entombment* by LUDOVICO CARACCI.

The interest which the thirty paintings by the late JOHN PETTIE excite can hardly fail to be mixed with regret for the loss of an artist when his power was strongest. Among all the northern painters of our time he appeared to be the most qualified to become the illustrator of WALTER SCOTT. There is nothing of the professional model in strange costumes or in inconvenient attitudes in PETTIE's paintings. He had a gift enabling him to project his mind into the past and to paint old ways of life as if they occurred before his eyes. At the same time there was a shrewdness and humour in him, as in SCOTT, which not only kept him from allowing imagination to run into excess, but often imparted additional interest to his works. Look, for example, at the *Gauger and the Smuggler*. The wild cateran who grips the officer by the hair and has gained a "crook" on him with the right leg while trying to pierce him with a skean, seems to be as formidable an enemy as the octopus in HUGO's "Travailleurs de la Mer." But the elderly gauger is not surprised by the attack. We feel he is familiar with Highland tactics. His aim is not to kill the young

culprit, but to preserve him uninjured with a view to his appearance in court, when law and the excise will be vindicated. He does not use his pistol, but trusts to his strong arms, coolness and conviction of superiority. The Greek sculptors sometimes made their victorious warriors appear as smiling; this burly gauger seems ready when the struggle is over to become jocose. What painter has expressed so vividly the farmer's satisfaction over a plenteous harvest as we see it in *The Laird*, where a Scottish BOAZ with his hands in his waistcoat pockets contemplates his reapers with the air of an ancient amateur in a picture gallery, or MONKBARNES before his Roman Prætorium? The *Jester's Merry Thought* is as hilarious as an event in the life of the Clerk of Coptmanhurst. There is even more amusement in *Two Strings to her Bow*, for we can almost hear the girl's laugh at the awakening from love's young dream on both sides of her. *Ho! ho! ho! old Noll*—a young cavalier caricaturing the Lord Protector for the enjoyment of his friend—suggests the spirit of one party better than a volume; while the single figure of the *Puritan* is a revelation of the kind of men who upheld CROMWELL and made him feared through Europe.

Mr. PETTIE did not, we believe, attempt battle-pieces, for he preferred to express a subject by the aid of a few figures. Nevertheless, the spirit of a warlike age was suggested by him. The single figure, *Disbanded*, a stout Highlander returning home laden with arms and treasure, explains why the men of that race were to be feared when defeated. The *Chieftain's Candlesticks* is like a symbol of the loyalty which made a demi-god out of a mortal. *The Terms to the Besieged*, *The Flag of Truce*, *The Sally*, *The Drum-head Court-martial*, *The Threat*, &c., present before us the incidents that belong to a time when the sword was the only arbiter. To that time also belongs such scenes as *To the Death* (which was at first known as *Sword and Dagger Fight*), *Time and Place*, a man waiting for an adversary in a wood, and *Late*, which seems to be the adversary hastening to the duel. The *Jacobites* and *Treason* may be included with them. The collection has, therefore, far more unity than is common in similar cases, without being monotonous.

The execution of the works is admirable. Mr. PETTIE always seems to have had a definite idea about his schemes of colour, and whether he paints glaring tartans, cardinals' robes, scarlet cloaks, the brilliant doublets of cavaliers, or gorgeous dressing-gowns, he contrives to subdue the harshness. His figures become so life-like, one is tempted to speculate about their histories, for they all seem to have idiosyncrasies. The painting is vigorous, yet in some cases, as in *The Drum-head Court-martial*, the heads would bear comparison with MEISSONIER'S for effect.

Very different is the sensation which is afforded by the collection of STOTHARD'S drawings or designs for the illustration of books. Who can believe that the gentle beings represented in them were representatives of English life at one time? Yet they were appreciated in the early part of the century because of their naturalness. STOTHARD was to the *Spectator* and GOLDSMITH what PETTIE might have been for SCOTT. But probably the artist becomes more attractive when he draws little children. The amorini of ALBANO, CORREGGIO or RAPHAEL do not surpass STOTHARD'S. Only in that marvellous company which TITIAN threw across the middle of his *Assumption*, as if it were a living cloud, are they excelled. The miniature drawings by STOTHARD would be enough to form an exhibition.

While time has preserved all the beauties of his sketches on paper, scant mercy has been shown to his works in oils. It is not often we can see such general obliteration among modern pictures. Faded as is the colouring, it appears to be a survival of something in the manner of GIORGIONE or TITIAN. The forms also recall Greek types. The pictures may in their present state have the indefiniteness of a dream that is not unlikely to have surpassed the reality. The best preserved of STOTHARD'S paintings are, it must be said, far less inspiring than those which years have mutilated, and over which the imagination can revel.

In the little Black and White room is a replica set by WILLIAM BLAKE of his "Illustrations of the Book of Job." Special gifts or graces must be bestowed on a man to enable him to comprehend BLAKE'S work. We have not been so

favoured. Accordingly, the figures of divine and mortal beings which are represented do not in any way correspond with those which we can imagine as the *personæ dramatis* of the ancient narrative. Throats may, it is true, be developed on earth by singing anthems, but angels with throats that extend to their shoulders are hardly pleasing to the eyes of mortals. To appreciate the figures it is necessary to have a scale of proportions which are not to be derived from living things. Is it not wiser, instead of imitating votaries and pseudo mystics, to regard the designs with pity as the creations of a distempered phantasy, or the aspirations of a second MICHEL ANGELO whose powers were paralysed and whose hand was not obedient to his will?

CHRIST CHURCH CATHEDRAL, DUBLIN.

THE renewed invitation of Dean Greene to all citizens of Dublin to visit the cathedral on St. Stephen's Day attracted a large number of visitors. At 12.15 P.M. as announced, Mr. Thomas Drew, R.H.A., the cathedral architect, as for some years past, delivered one of his popular lectures on the history and interest of the cathedral at Strongbow's tomb.

Mr. Drew conveyed to the visitors the hearty welcome of the Dean and Chapter, assuring them that the lawful custodians of the ancient cathedral of Dublin recognised the common property in it of all citizens of Dublin, with whose history it was so intimately bound up. It was happily an institution about which—differing from most ecclesiastical possessions—there was no memory of wrong or rivalry. The spoliation of monasteries by Henry VIII., the plunder of churches, the violent dispossession of communities in a time of polemical warfare had not touched the Christ Church of Dublin. It had never been "taken from" anyone. Its ancient community, dating from 850 years ago, in Queen Elizabeth's time slowly and imperceptibly conformed to changed usage; its ancient estates were untouched by spoliation until 1870. On its present dean and chapter, by unbroken devolution, had come the trust of this strange and interesting church.

Its survival, he said, after a series of unparalleled disasters beyond that of all other churches was strange. Its origin was strange. Nowhere else in the kingdom could be seen a church foundation of the Christianised Danes, and the church of Sygtrig Silkbeard was beneath the visitors' feet. The foreign character of Christ Church and ancient Dublin was emphasised. The Danes were exclusive and paramount in Dublin for 300 years. Eight hundred and fifty years ago Sitric founded his Danish church. In 1170 came the foreign Anglo-Normans, and in 1190, bringing their artificers and stones from their native English counties, they built on the Danish their Anglo-Norman church. They exclusively held the English City of Dublin and its State Church for centuries. Irish were kept without its walls except when they wanted to buy butter or hides or such country produce. The disasters of the church were the barbarous destroyal of the choir apse by Bishop John de St. Paul in 1350 (now restored by Mr. Street); the fall of the east end in a great storm in 1461; finally, the crowning catastrophe of 1562, when the nave slipped on the peat bog foundation, the south side was destroyed, the roof fell in, and the north wall thrust out 24 inches, as it was at present.

Other churches had lost their histories. Literature of Christ Church made a small library. Other churches had lost their records. Christ Church, Dublin, had an amazing wealth of such. It had sent lately about 2,000 documents for safe keeping to the Record Office, and had its most famous records still in hand. Its splendid missals, if gone from it, were still safe in the Bodleian. Its Mediæval plate was safe at Kilkenny, and of post-Reformation plate it had a cellarful of splendid gifts of former times.

Connecting history with some relics still to be seen the lecturer had a fund of story. The (traditional) heart of St. Laurence O'Toole, hung in the chapel of St. Laud, was a peg on which to hang an account of that remarkable man and historic prelate and founder. The tomb of Strongbow illustrated the English invasion. The supposed effigies of Basilea, sister of Strongbow, in St. Laud's Chapel, illustrated the story of the message of "the Fall of the Great Tooth," and the saving of the Anglo-Norman garrison of Dublin by that intrepid lady.

Again the old lectern had the story of the first reading of Queen Elizabeth's English Scriptures, and, by gradation from it, to the tale of the scandalous imposition of the bleeding figure of Our Lord and the condign punishment of the monkish cheats. Next the crowning of Lambert Simnel and his story. Oliver Cromwell and his desecration, illustrated by the charred and insulted royal arms. James II. and his two years' occupation of Dublin was recalled by the tabernacle and candlesticks used at his masses in this the ancient Chapel Royal, and his statue, brought with his brothers from the old City Tholsel once over the way.

NOTES AND COMMENTS.

THE French explorations at Delphi during the past year have been richly rewarded. They have not met with the original of the *Apollo Belvedere* or any masterpiece of equal importance, for it must be remembered that Delphi was plundered eleven times before NERO sacked the temple and carried off five hundred bronze statues. The explorations were not entirely fruitless of sculpture, for several figures more or less perfect and many fragments that reveal novel subjects were unearthed. The principal "find" was the treasury of a small Doric temple *in antis*, of which the details are fairly well preserved. It was a memorial of Marathon, and apparently was constructed at different times, for the work is not of uniform excellence. The operations at present are mainly directed towards the solution of an archæological mystery, that is, the place whence issued the "sacred breath" of APOLLO, which was supposed to inspire with prophetic fury the Pythia as she sat on the tripod, but sometimes was as fatal to that individual as would be the vulgar vapour of a long-disused well. That there was a cavern of some sort in connection with the oracle appears to be undoubted. STRABO describes it as deep, with a narrow entrance. It was supposed that NERO put people to death at the entrance and then destroyed the cavern. Another tradition was that the breath came from a secret chamber in the temple of APOLLO. It is among the ruins of that building the excavations are in progress. It is concluded that if such a chamber existed it is not likely to be entirely demolished, especially as it may have been connected with some underground opening from whence vapour was derived. The anticipated result excites curiosity, for it would be amusing if the breath of APOLLO was only natural gas.

THE Council of the Chester Archæological Society are able to congratulate the members on the satisfactory work in the city during the year. The excavations in the city were continued under the superintendence of Mr. I. MATTHEWS JONES by Mr. HAVERFIELD, and later by Mr. E. F. BENSON, and resulted in the discovery of a further number of Roman inscribed and sculptured stones of considerable interest. The work has now so far been completed. The archæological discoveries made in the city during the year include the following:—On the property of Messrs. DICKSONS, Limited, in St. John Street, a portion of the old Roman wall, which has been allowed, though at great inconvenience, to remain *in situ*. On premises at the rear of Messrs. WALKER & KNIGHT'S property, Northgate Street, in making excavations for a new building, a Roman hypocaust (*in situ*); an Elizabethan room; and a chimney top carved out of the solid sandstone, and enriched with the characteristic embellishments of the period; and several stone jugs. It is the intention of the owners of Axon's Buildings, Lower Bridge Street (RANDLE HOLME'S house), to preserve as far as possible this relic of ancient Chester. It is also probable that the authorities of the city will undertake the complete restoration of PEMBERTON'S Parlour, which fell in the early part of the year. There are now 260 members belonging to the society.

ONE of the oldest of the houses in Brussels has been lately restored and adapted by M. SAINTENOY, architect. We refer to the Hôtel Ravenstein, which many of our readers will remember seeing as they passed along the Montagne de la Cour, to which it is contiguous. The house dates at least from the fifteenth century, when it belonged to ADOLPHE CLEVES. According to SCHAYES, with the exception of it, a part of the Hôtel d'Egmont and the remains of the Hôtel de Nassau, there is no vestige of the habitations of the nobles in Brussels belonging to the period that was prior to the Renaissance. The building has been now arranged as a sort of club or "centre de réunions" for members who are devoted to literature, science and the arts. In fact, it will henceforth serve similar purposes as Burlington House does in London. The various learned societies can have their special quarters, while some parts of the building will be common to all.

One advantage will be that the new tenants are likely to endeavour to preserve the building from an entire modernising or demolition.

UNLESS unforeseen contingencies arise, the approaching Building Exhibition should inaugurate a new era for enterprises of that class. Hitherto, owing to a number of difficulties, the collections were generally more or less fortuitous. In next March an effort will be made to realise ideas which were matured before announcements were issued. The promoters, with Mr. T. FREEMAN, F.G.S., as honorary secretary, and Mr. LARKINS as manager, are resolved that the contents shall be select and representative. For that purpose they have secured the co-operation of a consultative council consisting of gentlemen possessed of experience for the preliminary arrangements, and will be guided by the experience of the latter. In that way there is a guarantee against making the financial success of the exhibition a primary consideration. The aim of the promoters is to bring together goods of all classes having those qualities which are necessary if they are to be specified by architects. It is desired that the appearance of all objects in the exhibition should be evidence of value and eligibility, and in the second place that they should be the productions of the firms who exhibit them. Certificates of excellence will be awarded, which are sure to be accepted as valid. It is possible that in the first attempt the intentions of the promoters may not be completely realised, for in such matters manufacturers have to be inspired with confidence, which, after their experience with international exhibitions, is not easy. However, all will be done that faith in a good cause will make compulsory, for sooner or later the promoters have resolved to succeed in establishing an exhibition that will be considered worthily representative of the most important building industries.

THE working machinery in brick-making, tile-pressing, joinery-work and metal-working will be interesting features that will lead to architects and buyers visiting freely. As regards the letting of space, the manager expects that the whole of the gallery will be let as well as the floor below. This being the first of five years' exhibitions, those manufacturers who take space the first year will have the option of the same site for the following years; hence those who do not exhibit in 1894 may be shut out, to their serious disadvantage, for five years. There will probably be competitive bricklaying, wood-working, turning, plumbing, &c., with prizes for the best mechanics; perhaps a gold medal or champion cup to be competed for annually.

THE annual general meeting of the Royal Society of Antiquaries of Ireland will be held in Dublin on Tuesday next. The following papers will be submitted:—"The Crannog of Moylurg," by Rev. GEORGE R. BUICK; "The True History of the Two Chiefs of Dunboy," by A. J. FETHERSTONHAUGH; "The Franciscan Priory of Ennis, Co. Clare, and the Royal Tombs therein," by T. J. WESTROPP; "The Journey of Sir HENRY SYDNEY, Lord Deputy of Ireland, against the Rebels in 1569, from the note-book of NICHOLAS NARBON, Ulvester King-of-Arms," by G. D. BURTCHALL; "On a recently-discovered Pagan Sepulchral Mound in the grounds of Old Connaught, Bray," by W. F. WAKEMAN; "An ancient Bone Comb and Tracked Stone found in a Prehistoric Mound at Kilmessan, Co. Meath," by OWEN SMITH; "Irish Flint Saws," by W. J. KNOWLES; "The History of the Shamrock on Irish Tiles," by WILLIAM FRAZER; "The English Language: Its Origin and Progress to the Sixteenth Century," by Rev. D. F. M'CREA; "Slieve-na-Calliaghe," by GEORGE COFFEY; "Structural Features of Lake Dwellings," by ROBERT MUNRO. On Wednesday the members will visit the recently discovered Pagan Sepulchral Mound in the grounds of Old Connaught, Bray. According to the annual report there are now in the society 189 fellows and 105 members, an increase of 50 over the number for last year. The financial condition of the society is also satisfactory.

THE DESTRUCTION OF BABEL: THE SCATTERING OF THE PEOPLE.

THE DESTRUCTION OF BABEL, THE SCATTERING OF THE PEOPLE.

IN realising the great project which WILHELM VON KAULBACH placed before himself, which was, like MILTON'S, to "assert eternal Providence and justify the ways of God to men," his first effort was to display the movement which led to so many important events. The artist was a thinker, and he interpreted the history of the downfall of Babel in a manner which corresponded with modern theories. The old expositors of that history showed little sympathy with the desire for knowledge of the unseen which might be supposed to have animated those pioneers of science, the ancient builders, and they gloated over the failure, as if the ambition to ascend beyond the earth were limited to the Plain of Shinar. MILTON was among those who would allow no pity towards the men who were so daring in construction, and when describing them as stricken, his verse lost not only sweetness but grandeur:—

Forthwith a hideous gabble rises loud
Among the builders; each to other calls
Not understood; till hoarse, and all in rage,
As mock'd they storm: great laughter was in heaven,
And looking down, to see the hubbub strange,
And hear the din: thus was the building left
Ridiculous, and the work Confusion named.

NOW KAULBACH does not ignore the event, nor does he suggest there was fear in heaven of an invasion. On the contrary, he makes it manifest that he believed a wrong was done by the king, who, in the pride of his heart, like so many Eastern rulers, assumed he was more than mortal. But KAULBACH believed, with the English poet, that out of our broken days and deeds the infinite purpose of time is builded up solemnly and surely. He depicts, therefore, the dispersion of the tribes as a consequence of the confusion of tongues, but with one exception—that is, the evil implied in the central group—the artist avoids introducing anything which would signify his belief in the persistence of the confusion. We might almost suppose from what is seen that the scattering was an advantage for humanity—or of one part of it—as there was an elimination of elements which had been embarrassing to progress. The picture is not an illustration of the text in the ordinary way, for it is an interpretation which was inspired by universal rather than Jewish history.

The painting forms a series of scenes, among which there is not one which does not bear a relation to the general idea. The Tower of Babel has been condemned. The presence of the ALMIGHTY accompanied with angels bearing flaming swords is enough. There is no apparent mechanical or physical cause suggested for the catastrophe, but mysteriously, as if swayed by an invisible agency, the scaffolding is giving way and the workmen fall. It is so sudden and unexpected that some of the operations are not suspended. We can see a party of men, harnessed to a lorry, still drawing the shaped stones (the license was taken of rejecting brickwork), and the sturdy overseer who serves as driver gazes as if an ordinary accident had occurred. The woman who warns them appears to have seen still more terrors in another part of the building.

We may next glance at NINUS, who has set up his throne upon the lower and completed part of the building. This mythic personage, who is sometimes supposed to be an Assyrian HERCULES, represents monarchy at its worst, when the words "through Me kings reign" were not accepted. The idols or symbols of NINUS have been struck, but he remains unmoved. Like LUCIFER—

Round he throws his baleful eyes,
That witness'd huge affliction and dismay
Mix'd with obdurate pride and steadfast hate.

From his courtiers, poets, musicians, advisers and sycophants, "a crew whom like ambition joins with him or under him to tyrannise," he receives only mockery. There is a collapse of the old system, and they anticipate that under new conditions they will be the gainers. The concubines of the king remain, but they are helpless.

The upper part of the design may be said to represent pride and its punishment. But as mercy always tempered justice,

the picture would not be complete if it came to an end at the foot of the Tower of Babel. We are to suppose that for the subjects of NINUS there was to be no longer a general co-operation in embodying his schemes. Instead of being struck with the flaming swords they are separated into groups by deprivation of the power to employ a common language. The beginning of the dispersal is represented in the lower planes of the design, and by the characterisation of the groups a clue is afforded to the history of the world.

Numerous as are the figures, they form three distinct divisions. In the centre, as if they were in correspondence with the spirit of NINUS, we have men and women of the race of CHAM, who represent systematic idolatry. The priest bearing the hideous idol is most honoured: so long as it is preserved all other losses are trivial. At one side is armed idolatry, at the other a sorceress. The girl who kisses the priestly robe and the men and women who follow are worthy companions in an enterprise which is to depend for existence on the degradation of man. This is suggested in a remarkable way by an omission. In every exodus, as in all military undertakings and engineering contracts on a large scale, ancient and modern, the first question must be, How is the multitude to be fed? The votaries of the middle group have made no provision that is apparent for future needs. As long as men are weak, organised idolatry can remain free from apprehension of dying out through want.

On the right are the children of the family of JAPHET, the hunters and warriors who seem by their turning towards the background as if they were destined to follow a course that if not retrograde was not to be marked by progress. The Bedouin of to-day resembles his ancestor who lived three thousand years ago.

In the group on the left side we see civilisation in an early form, which is certain to expand. The family exists in its perfect form and the head of it serves as pastor or priest. The upward glance and the outstretched hands are signs of his devotion; a blessing is asked and bestowed. The son who already is competent to guide the wain and looks resolutely towards the future, who carries his crook like a sceptre, is destined to be a ruler; he may be another DAVID, shepherd, king and poet. That morality reigns among the group is evident, from the alarm which is excited by the proposals to join the idolatrous party. It is also plain that among this family the value of property is appreciated as a necessity for stability. It is not only flocks and herds have been reared, but enough capital in the form of provisions, at least, must have been accumulated to allow the mechanic arts to be practised. The difference between the woven robe of the patriarch and the raiments of skins which are seen among the hunters on the other side, may be taken as a test of the advance which the representatives of the principle of civilisation have attained. The package of household goods carefully made up, the distaff, the supply of grapes for the infants, are all signs of prudent domestic government. The noble mother, who leads as if she were the guardian of the family, is a prototype of "the valiant woman" described by the Wise Man:—"Quæsit lanam et linum, et operata est consilio manuum suarum."

KAULBACH has endeavoured to unite the figures in the different groups. It was probably with that intention alone he introduced the episode of the murder of the architect. There are precedents to warrant the supposition that Babel could not be destroyed without somebody believing that the designer was the real cause of the misfortune. KAULBACH could be sarcastic, and he suggests that the murderers were building workmen; he may have seen while decorating buildings enough disloyalty among men of that class to justify his selection.

KAULBACH'S paintings in the Berlin Museum have been engraved by Professors EICHENS and JACOBY in a style that reflects credit on the patriotism and love of national art of Herr DÜNCKER, the art publisher to the Imperial Court, by whom the commission was given. By his permission the illustration has been reduced from the first plate. The series is utilised in Germany, but as the subjects are of universal interest there is no reason why the plates should not be also turned to account in this country. As offering materials for thinking there are no modern works superior to KAULBACH'S. Herr DÜNCKER has produced illustrations of the paintings in other forms to meet all requirements.

A SCULPTURED HISTORY.

By H. P. BURKE DOWNING, A.R.I.B.A.

Rose window of N. Transept.

particular, to perceive how interesting and how well told.

Briefly, the sculptures over the great triple doorway represent the consummation of the Christian's hope—CHRIST enthroned in glory amidst His apostles and saints,

a subject not to be adequately handled in a general description. The figures standing in the highest places east and west of the great rose window, shown in my sketch of the north transept, are those of the four archangels, typical of the kingdom of God in Heaven; while the figures in the intermediate posi-

writing and translating he was engaged up to his very last hour.

In St. AIDAN, who is joined with St. ALBAN, a British martyr before our Saxon forefathers had any knowledge of the island, is represented Celtic Christianity. The story of St. AIDAN, first Bishop of Lindisfarne, the see from which Durham traces its descent, tells us of the difficulties and dangers that opposed the first missionary efforts in Saxon England. OSWALD, king of the united kingdoms of Deira and Bernicia, having during the troubles of his early life had experience of the hospitality and friendship of the monks of Iona (an Irish settlement), and having himself become Christian, determines that his people too shall hear again of the true faith, from which, though it had once been planted amongst them by PAULINUS, they had fallen away. He applies to the monks of Iona to send him a missionary helper. The first messenger, CORMAN, the grave and learned, fails to convert the people, and on returning to Iona endeavours to dissuade any other from entering on the task. AIDAN, however, a young brother of the monastery, perceives that the fault has lain very much in the preacher's lack of sympathy with his hearers. His shrewd discovery of the fault points him out as the man to make the mission a success. He is consecrated to the work, and sent (A.D. 635). For seventeen years he toiled as Bishop of Northumbria, working side by side with the king, and establishing the Celtic

tions are representative of the course of English Church history and the individual history of the Abbey. It is to these I wish to confine myself for the present, and even of many of these I cannot do more than mention the names; an exhaustive treatment of the whole would necessarily be very extensive.

Representative of the early Latin and Greek learning imported into England with the Christian Church stand BEDE, the monk of Jarrow, and THEODORE OF TARSUS, Archbishop of Canterbury, whose work was the organisation of the ecclesiastical system in England. BEDE, whom I have selected for illustration, is represented with cowl and head studiously bent over a book, for his life was spent with books, and for the sake of learning he gave up the advancement that might have been his. With

Church where the Roman had failed to make a permanent footing. His fame is eclipsed by that of St. CUTHBERT, who held the see some fifty years later; but it was to the enterprise of the Irish monks of Iona and to AIDAN's untiring courage and zeal, that the establishment of the Christian Church in the North was due.

A short-lived Church had already been established in Northumbria by St. PAULINUS, who with St. AUGUSTINE represents in this historical procession the missionary enterprise of Rome in England. PAULINUS came to the North in about the year 627 A.D. with the Kentish bride of EDWIN OF NORTHUMBRIA, and all have read, either in the account of BEDE or in the well-known verses, of the incident which so strikingly shows the way in which the new faith appealed to the nobler minds among our heathen forefathers, as

holding out a hope concerning the future after our brief life here has been spent, that life which in the image of the Northumbrian Ealdorman is but as the flash of a sparrow through the fire-lit hall from darkness into darkness. PAULINUS did not long remain in Northumbria; the successes of PENDA, King of Mercia, and champion of the old faith, drove him to take refuge in Wessex, and the Roman Church in Northumbria died out.

St. DUNSTAN stands with St. BENEDICT as the representative of that vast system of monasticism which so quickly took root in the early English Church and so long endured.

incident of one of the fierce inroads of the Danes, as fierce and implacable as had been, several centuries before, those of our own Saxon forefathers upon the British. The leader of an invading Danish host sends word to King EDMUND demanding his submission. The reply of the King breathes the spirit of our oldest English poetry—he will never bow to the Dane till he turn Christian, “Nor,” says he, “will I that I live alone after my dear thegns, who have been foully slain by the Dane.” His constancy, however, proved only his destruction. The Dane, coming close on the steps of his messenger, King EDMUND is taken un-

Conjectural Completion on the Lines of Henry III.'s Work.
By Mr. H. P. BURKE-DOWNING, A.R.I.B.A., F.S.I.

St. DUNSTAN's fame as an ecclesiastic, which is perhaps subordinate to his fame as a statesman, was in the character of an upholder of strict monastic institutions. The story of his life contains several miracles, but the most widespread piece of learning concerning him is that of his adventure with the Devil, who, in the form of a woman, visited him at Glastonbury, where he was abbot, in the smithy which he had set up “beside his cell, in order to have employment for his hands when for very weariness he was compelled to rest from his orisons.” The writer of the “Life of St. Dunstan” was struck with the humour of the incident of his tweaking the Devil's nose with the red-hot pincers, and ends up his account of it with the remark that the Devil “came no more thither to be cured of cold in the nose.” St. DUNSTAN's influence in his time as an ecclesiastical statesman was as great as that of St. THOMAS à BECKET and Cardinal WOLSEY in later years.

The martyrs of the early English Church are represented by St. EDMUND and St. BONIFACE. Our account of the death of St. EDMUND, King and Martyr, is derived from ÆLFRIC's “Lives of the Saints,” the author of that account claiming to have had his knowledge by a direct chain of descent from Archbishop DUNSTAN, who, in his early youth, heard it at the Court of King ÆTHELRED, from the lips of the aged sword-bearer of King EDMUND himself. It is an

prepared, giving himself up, indeed, in hopes to save his companions, and suffers a death like that of St. SEBASTIAN. A pretty story is told of how a grey wolf guarded his head, which had been thrown by his murderers into the wood,

until his friends found it and buried it with the body, to which it became miraculously reunited. Over the place of his martyrdom and burial rose the famous Abbey of Bury St. Edmunds.

The figures of GROSTÈTE, Bishop of London, and ROGER BACON, his pupil, the famous Franciscan friar, are representative of the leaders of scientific inquiry which the Church, in spite of herself, sent forth in the Middle Ages.

Such are a few of the stories brought to mind by the representative sculptures of early English churchmen. Of the figures more immediately connected with the Abbey itself there is first MATTHEW OF WESTMINSTER, whose name sufficiently bears witness to the nature of his connection with the Abbey, and who stands to represent the old monkish chroniclers, who have preserved for us the records of our early national life. With him is CAXTON, whose printing press was set up in England in the Almonry of Westminster,

that the portico in front of the north entrance, which remained until the seventeenth century and was known as "Solomon's Porch," was built. The figure of RICHARD is taken from the celebrated portrait—a contemporary likeness—now in the sacarium.

The Abbots WARE and LITTLINGTON stand to represent the abbots under whom the structure of the Abbey was advanced. It was Abbot WARE who in 1267 brought back from Rome, whither he had gone for confirmation of his election, the mosaic pavement which remains in front of the altar, inscribed with his name. WARE also is known as the compiler of a book of the "Customs" of the monastery.

The work of LITTLINGTON was more extensive. It was under him (1362-86) that, with the benefaction of a predecessor of his, the present deanery was built, as well as the southern and western cloisters and many parts of the conventual buildings now no longer existing.

where he received royal visitors and from which the earliest printed books were issued.

Two abbots of the first foundation fill the next niche—WULSINUS and EDWIN—and then come two pairs of royal benefactors, RICHARD II., with his Queen ANNE OF BOHEMIA, and the martial HENRY V., the hero of Agincourt (for which victory a thanksgiving service was held in the Abbey), with KATHERINE OF FRANCE, his queen and ancestress of the Tudors. Much of the nave was built with grants from HENRY V.

Ill-fitted as was RICHARD II. for the business of government to which he was born, he was well qualified to be a patron of art. He always bore especial love and veneration for the Abbey, in which his coronation and marriage were celebrated with unusual splendour. It contains the tomb which was raised over his consort ANNE, and it was under him

Considering the long line of founders and benefactors, it is perhaps remarkable that, with constant additions, the structure has never yet been completed in the form which would no doubt have been given to it had HENRY III. completed the work which he began. I allude, of course, to the absence of the central tower, which I have no doubt, and on a former occasion have shown, would have formed a feature of the building of HENRY III., and which, as is witnessed by the structure itself, the Abbey as it stands was intended to have. The fact that it has square battlemented towers at the western end, instead of spires in character with the rest of the building, is of course due to the fact that the style of a later period was followed, but the provision for a central tower is undoubtedly in accordance with the design of its first founder, and the want of it might yet be repaired.

TESSERÆ.**Belfry Turrets.**

BELFRY turrets are usually placed in the south-west, more rarely in the north-west, angle of towers; they occur also in the south-east and north-east. They are polygonal, and project half externally and half internally, and have a small doorway opening into the inside. They are carried up either to the height of one or two stages, or to the belfry windows, and then weathered off with a bold and picturesque slope, or they rise above the weathercock or other pointed termination. Very frequently they are lost in the buttresses, which are, as it were, thrust prominently outwards by a bulging swell of the masonry in one angle, readily distinguished from the rest by its visible protuberance, and by small slits to admit light and air into the staircase within. Sometimes, as at All Saints, Paston, near Peterborough, the head of the turret merges into a broach of the spire, which gives an extremely bold and irregular effect. There can be no doubt that irregularity gives effect to a tower, or indeed to any Gothic building. Not irregularity for irregularity's sake—that becomes affectation. But such irregularity as arises from the absence of hypocrisy, or show, or making one side the same as the other, or the like. There is no need to fear a broken or shapeless mass as the result; uniformity is far less pleasing than variety; and the eye can never be offended in Gothic buildings by a door, a window, or a buttress being fairly pushed aside by the intervention of any necessary constructive feature. Nothing was more fully felt by the ancient architects. In very elaborate and splendid towers one belfry window is sometimes placed on one side instead of in the middle, even though the belfry staircase which caused this remarkable irregularity was scarcely visible on the outside. Examples of this are St. John, Ryhall, and All Saints, Oakham, in Rutland. Sometimes, as at St. Wulfran, Grantham, the splendid Decorated tower of which has scarcely a rival in the kingdom, one of four pinnacles is considerably larger and higher than the other three, because it forms a capping to a staircase turret. Yet who shall be bold to say this is a fault? By all means break up monotony and sameness of sides by some such expedient, and a belfry turret seems most admirably adapted to produce almost any kind of bold picturesque effect. From a distance the lights and shadows, the peaks and the broken lines, are vastly imposing and arresting to the eye. On a near view the bold abutment of an angle seems at once to flank and to prop the stages of a lofty tower, and on every point whence the effect is visible, the mind is gratified by the idea of ingenuity or pleased by the suggestion of necessity made subservient to decorative effect. Some belfry turrets are corbelled off a little above the ground externally. This, though not a material difference of construction, is to be deprecated, because the tower is apt to appear overbalanced by an excrescence which emerges from the wall itself, and does not rest upon its own basis on the ground. In St. Peter, Barton, near Cambridge, the south-west angle is singularly prolonged into a wedge-like form from the internal formation of a belfry tower, and sometimes the most beautiful forms and enlargements of buttresses are used to give scope for the staircase. It is true that many ancient towers were ascended by ladders, and in a few are to be seen wooden stairs enclosed in wattled or boarded turrets constructed in the interior. The ascent to the floor on which the bell-ringers assemble, if above the ground, should be the belfry turret, though the entrance to it should never be from without, independently of any other communication with the interior of the church.

Metal Working in Nuremberg.

When the beautiful well (the *Schöne Brunnen*) in Nuremberg, which was among the earliest of the great works in iron, was enclosed two centuries and a quarter after its erection with the high railing still standing, by Paul Köhn in 1586, he invented a device which highly pleased the Nurembergers—the insertion of loose iron rings set in the transverse bars, a treatment of which only welded metal is capable, and which was unanimously declared to be a sign of the Nuremberg workmanship. The date of the erection of the *Schöne Brunnen* is 1355 to 1361, and there yet remain many other productions of the same master, Schonhofer, who designed this remarkable work, figures not only in iron but in stone, commemorative of the Blessed Virgin and patron Saints attached to the private houses. Originally the figures, crockets, pinnacles, &c., were painted and gilt, as indeed every production of the fine arts in the world has been, more or less, until the Renaissance superseded native architecture, and the bleached remains of the ancients were set up in place of the living and breathing, although less perfect, works of the day. From the time of Schonhofer, with whom was associated Fritz Rupprecht in his principal work, there was a succession of skilful artists, some of them undertaking work indifferently in iron, stone or wood, assisted in the same manner by others more exclusively devoted

to the particular material required. This mode of working in brotherly harmony was assisted by the establishment of guilds and companies strictly regulating and limiting the practice of crafts and mysteries. Every art had its guild, even poetry, and some of the restrictions and penalties in the power of those societies remain in force at the present day. Thus, Adam Kraft in his old age was accustomed to rely on the assistance of his brethren in trade, Peter Vischer and the coppersmith Sebastian Lindenast, who designed for him the decorations on festival days and other matters. We also learn that the five sons of Peter Vischer (the greatest master in metal Nuremberg has produced) assisted their father in the shrine of St. Sebald. "This Peter," says Neudörfer, "was of manly and friendly speech, and as a layman may say, skilled in natural science. He was also much esteemed by great men, so when a prince or potentate came to Nuremberg, he seldom left without visiting the foundry." The father of Peter was also a coppersmith, and Rettberg says the wonderful works of the Viscchers were demanded far and wide. The statuette which this noble old Nuremberger made of himself on the shrine of St. Sebald shows us the workman in his close cap and ample leather apron, chisel in hand, "the simple coppersmith who would make plain candlesticks for household use, as well as raise the shrine to the honour of the heavenly prince; a handy-craftsman like many others, but one so learned and skilful that princes delighted to visit him, and the after-world has willingly placed him among great artists." Vischer's five sons died one after another in their prime, and their remaining works are supposed to be few; but the young kinsman of the patriarch, Pankraz Labenwolf, worthily transmitted his genius to the next generation. To him belongs the fountain in the court of the Rathhaus, and that in the Goose Market, surmounted by a bronze countryman carrying a goose under each arm, a figure that the carvers in wood are still very fond of reproducing for the chimneypiece. Another eminent name, that of Sebastian Lindenast, is particularly associated with locksmith work and clockmaking. From 1462 to 1520 he continued, says Rettberg, the exertion of his talents, and as the style prevailing in the great majority of the decorations on the doors and gates of the city identifies them with this period, perhaps we should not be far wrong to give him the honour of nearly their entire production.

Savonarola's Influence on Painting.

The naturalistic state into which art had fallen in Florence at the time of Lorenzo de Medici can in no better manner be ascertained than from the active part taken by the great moralist and reformer, the Dominican monk, Savonarola, to repress it. Included by him in the category of pagan and sensual manifestations which the revival of letters, and the consequent pedantry exhibited in the attempts at the reproduction of classic taste in literature, had awakened in the art-displays of his day, they had their full share in those stern denunciations in his well-known Lenten Sermons, in which no individual, from the prince to the peasant, and no occupation, from that of the podestà to the painter, were spared. The great reformer aimed at the extinction of the prevailing and absorbing naturalisms, and the effects of the reasonings of the schools of cold philosophy which the study of ancient classic writers had introduced. He lamented in no measured terms that so much materialism had virtually suppressed spirituality and religious zeal in art. His influence on the fine arts was designed to overcome the precise misdirection of view that then generally existed, and which his powerful eloquence only stayed for a few years. Some of the most celebrated Florentine artists of his day were roused from their materialistic stupor by his exhortations to a sense of the indifference into which they had allowed their art to subside. Many of them at once reformed their practices. Some even abandoned the pursuit of art altogether, and sought refuge in the cloister. The following quotation from one of the sermons of this distinguished preacher, given by Marchese and Rio, will show how he contended against one of those mistakes in the practices of imitation. It will be seen how little importance he, a man learned no less in the writings of the ancient pagan than in the modern ecclesiastical authors, attached to the imitative or naturalistic rendering of specific fact when applied to elevated themes. Thus he speaks to the artists in Florence:—"Your ideas are stamped with the grossest materialism. The beauty of things composed consists in the proportion of their parts or the harmony of their colours; but in that which is simple, beauty is transfiguration—it is light. It is, then, in something beyond the visible that we must seek for the essence of supreme beauty. The more nearly the creature participates in and approaches to the divine beauty the more beautiful it is, because the beauty of the body depends in great measure on the beauty of the soul. For instance, if you select two women of equal beauty from among this audience, she who possesses the greatest holiness will excite the greatest admiration in the spectators, and the palm will even be awarded to her by men of carnal minds." The naturalistic views which succeeded the spiritual, and the classic and other tastes of which the history

of the times has thus explained to us the reason, are tendencies evidenced by masters no less eminent than Michel Angelo, and seen in the lower part of his *Last Judgment* and ceiling of the Sistine, and also by Raphael in some of the frescoes of the Vatican, and were at no distant period destined to be misapprehended and exaggerated by scholars and imitators, so as ultimately to lead to the superseding of the religious element and to become the pretext in the ornamentation of ceilings and walls for the manufacture of allegory and the mechanism of the decorator, and are among the reasons of the heartless and uninteresting displays of the end of the sixteenth and first half of the seventeenth century in Italy.

Geology and Building.

If we look to the early history of the most ancient nations we find that the art of building has attended the first advance of civilisation, and the use of worked stone has succeeded to caves in rocks and the rude wicker or earthwork of their common and early structures, but the conversion of stone to the increasing artificial wants of society was necessarily consequent on the advance of the mechanical arts before it could be shaped and applied. How interesting are the first though rude efforts displaying practical geology. The bold and noble monuments of the early ages show the natural vigour of the human mind untutored in the mechanical skill and art of later times. The stupendous monolithical structures and those early sepulchral monuments known as cromlechs, cairns and moats, which abound throughout western Europe, were doubtless the work of a people who, taking nature for their guide, by prodigious labour raised and put together and frequently conveyed to great distances for the erection of their monuments the immense stones which, detached from their native beds, were distributed over the surface of the country. Most of those stones are of the primary and crystalline class of rocks, which from their hardness have resisted the violence of that disturbing power which removed them from their mass and afford us a good knowledge of their enduring quality. Moreover, the originality and boldness of their application resulted from minds familiar with nature's works and untaught in the arts which in after ages accomplished by skill and the use of smaller-sized materials what the early ages unskilled in building could alone express by the magnitude of the stones. Let us consider the more advanced history of the principal nations of the earth, and we shall find that geology has received great consideration. The architects and sculptors of Greece and Rome knew the qualities of their materials, and if we may judge from ancient writers and existing remains, gave considerable attention to them, abounding as those countries did in good materials. In the writings of Vitruvius on Roman architecture the most particular rules are laid down with regard to the selection and use of building stones and the cements employed with them. How important are the results of their influence on society. If Egypt, Greece and Rome had had their principal structures of a perishable material, what would we not have lost? What interest would we now feel in those countries, or how could we have derived the great advantages which have flowed from them? Good materials and a right knowledge in using them have, however, produced a different result, and again, what do not those countries owe to the durability of their structures, conceived as they have been in a noble spirit? Without them Rome of the present day would be unvisited by the countless thousands whose wealth now enriches her; without her buildings the classic shores of Greece would gain less of European sympathy; nor would the dusky inhabitants of Egypt occupy such interesting ground but from the remains of the stupendous and imperishable monuments of her past history. Our own kingdom also possesses proud memorials in the enduring monuments of the Middle Ages. Those connecting links with the past and present afford us noble examples of the religious zeal and skill of our forefathers, whilst the perseverance which has been displayed in accomplishing their erection is much calculated to stimulate us to bold designs. These indelible landmarks of his early home the traveller finds deeply implanted in his mind, and it is difficult for us to estimate their effect on society in the attachment they cause to our laws and institutions. Nor do those venerated and bold structures fail to excite a powerful feeling in the inhabitants of the New World, who, though born in a distant land, contemplate with pride and fervent admiration the works of their progenitors. But the edifices of centuries past, many of which, even in their dismantled state, have withstood the destructive violence of the elements, will yet outlive very many of the most costly structures of the present day, and until a very recent period so comparatively few were the buildings calculated to endure to any distant period that future ages, judging by our public structures, will look upon the people of the present time as a degenerated race, and in the erections of centuries back will contemplate the finest and most durable monuments of architectural skill.

THE ENTRANCE EXAMINATION AT THE ECOLE DES BEAUX-ARTS.

IN the *Architectural Record* (New York), Mr. Ernest Flagg gives the following graphic description of the preliminary examination he underwent prior to admission as an architectural student in the Ecole des Beaux-Arts:—

The school is free, supported by the Government. The appliances gathered here for a training in art are such as only a nation like France could accumulate in centuries, and such as is not found elsewhere in the world. The reputation of the school is such that there is no second. Naturally admission to it is eagerly sought, but alas! there are barriers to be surmounted before one can enter. The Government has no intention of wasting the public funds on unpromising aspirants. The examinations take place twice in each year, in the months of March and July. Between two and three hundred apply, and only about one-eighth of that number are received. Recently the number of admissions was limited to thirty. The examinations consist of architectural composition, modelling in clay, drawing from cast, descriptive geometry, plane and solid geometry, algebra, arithmetic and history. The first three are called "admissibles." If these are not successfully passed, one is debarred from taking the others. Perhaps the best way to give a clear idea of this trying ordeal will be to describe my own experience.

Having secured a letter of introduction from the United States Minister, which is necessary, I presented myself at the school and was enrolled on the list of aspirants for the next examination. Before nine o'clock on the appointed day I found myself, with about two hundred others, in the "Cour des Loges," armed with drawing-board, T-squares, triangles and drawing instruments. Monsieur Barbier, chief guardian, "Département d'Architecture," resplendent in his uniform and cocked hat, mounts the steps, orders one of his lieutenants to lock the gate to the court, then, to make matters perfectly fair, he takes a small dictionary from his pocket, opens it in the middle and selects the letter which first meets his eye, from which to begin the roll. Naturally the roll generally commences at about the middle of the alphabet. Then follows an interminable list of names. Each one, as he is called, enters and signs a register. I, who know no French, strain my ears for something which resembles my name, with the result that I bring up the rear amid a volley of what I take to be French profanity from Monsieur Barbier, who has to correct his register, and who has no great love for "les étrangers" under any circumstances. I mount five flights of stairs and find myself in a room about thirty feet wide, but of tremendous length. At the door I am handed a programme, an imposing document lithographed on a large sheet. Along the room on either side extends a row of stalls, for all the world like those of a stable; these are called "loges." In the centre are long tables. Each loge has a shelf, which for one to work on, and a small window. The first to arrive occupy the stalls; those who come later must content themselves with the tables, where the light is very bad. One is free to walk about as he pleases and to make all the noise he cares to, and each individual of the two hundred or more present is availing himself of these privileges to the utmost.

Many present are old hands who have tried the examinations before, without success, and feel at home. Some even have the hardihood to propose an initiation of the newcomers (*réception des nouveaux*). It is now about eleven o'clock and time for *déjeuner* or breakfast. I notice a great many issuing from a door half-way down the room with eatables, and upon investigation I find it leads to a sort of kitchen where bread, sandwiches, coffee and wine can be bought, the latter at 7 cents a bottle. The whole company are now regaling themselves at the tables, which presently literally flow with wine and coffee. Suddenly there is a great crash and shouts. Some one has knocked the legs from under one of the tables. Bottles, plates, &c., fall in a heap on the tiles. This is too much even for the uniformed guardian, who has thus far been standing stoically with his hands behind his back near the door, and his voice is now added to the general uproar.

Déjeuner over, the tables righted and the wine mopped up, work finally begins. Most of those present repair to the stalls and scrutinise the programme. There is an immense amount of visiting from one stall to another in search of ideas from those supposed to be strong (*les types forts*), but the room is comparatively quiet, with only an occasional cry of "Vive Boulanger!" cat-calls, and songs from various quarters. The programme calls for a little "portique," to form a point of view from a château, and to serve as a shelter for eight statues, owned by the proprietor, the building to be erected upon terraces in which can be arranged grottoes, &c. The greatest dimension is given, also the scale at which the plan, section and elevation are to be drawn; a detail of the order must be made at a larger scale. The time allowed is nominally twelve hours, but as the various preliminaries described above occupy

so much time, and as the guardians are in a great hurry to go home to their dinner, the actual time which one can work is only a little over eight hours. I work as I never worked before, but, do my best, the light begins to fade before I have washed in the shadows on the elevation. I had been warned to take candles, and provided myself with six; taking possession of one of the now deserted loges, I rashly proceed to light them all, but it is not long before I discover my mistake. Some one passing gives a whoop, and in a moment half of those left are gathered in front of the loge shouting, "Quelle illumination! oh, yes! oh, yes! * mon dieu! quelle illumination!" I think I am going to be mobbed by the dancing crowd, and it is some time before the excitement sufficiently subsides for me to resume work.

The next day and in the same place follows the examination in modelling in clay. Each student is required to bring his own clay and tools, and woe betide the unlucky aspirant who is not informed. In each loge is a plaster cast of a piece of ornament, all exactly alike. Eight hours are allowed to reproduce it in clay. This day the tables have disappeared from the centre of the room, and in their place at intervals are piles of sawdust and pails of water—the water to wash the clay from the hands and the sawdust to take the place of towels. The next day the examination of drawing from the antique completes the admissibles. For this, like the modelling, eight hours are allowed. The students are distributed in the various hemicycles and *déjeuner* is not a feature of the *séance*. On the wall of the room I am in is a clock which strikes the quarters, and every time it strikes a deep groan resounds from every throat, but otherwise there is no noise.

Great is the excitement at the posting of the names of those who have passed, and great is my joy to find mine among them. I am now permitted to take the examinations in mathematics and history, but as I know scarcely a word of French I present myself simply for the form, that being necessary in order that I may not have to undergo the admissibles next time. By the time the next examinations came around I had accumulated a limited store of bad French, and had time to brush up, indeed to polish, my acquaintance with algebra, geometry (plain, solid and descriptive), and to lay in a goodly store of history. Each of these examinations is both oral and written. Only one question in each subject is asked, and failure means half a year's wait. The first examination was in written history, and the question, as nearly as I can remember it, was as follows:—

"It is proposed to erect a monument to the writers of the eighteenth century. Give a brief description of the design; the monument should be adorned with statues of authors and have upon it suitable inscriptions. What names should be so honoured, and which should receive places of the greatest distinction? Give an account of the principal works of the various authors, also a short account of literature of this epoch."

The examination was held in the beautiful hemicycle of Paul Delaroche, and from my place of vantage on one of the upper tiers I could see a great deal of cribbing going on below. The first care of the guardian was to make a map of the room, showing the location of each pupil. This to aid the professor in the detection of frauds. If two papers are found to be suspiciously alike, he looks up the location of the men; if near each other he determines at the oral examination which one has cheated. Once detected in a fraud, that young man had better choose some other occupation in life than architecture, for he will find it extremely difficult, if not impossible, to ever enter the school.

The oral examinations in history are held in the same place. A printed list of questions is furnished upon application. They embrace about fifty epochs of history, art and literature. The subjects are chiefly classical and French. The United States is honoured by two questions. The questions concerning the English relate exclusively to the driving them out of France by Jeanne d'Arc and Duguesclin.

The professor of history conducts the oral examination in person; he is the only professor with whom the candidate for admission is brought in contact during the examinations, and the impression he produces is most agreeable. He sits in state on the rostrum. Before him on the table is his hat containing slips of paper, each with a number corresponding to a question. The student, when his name is called, advances to the table and draws a number from the hat. The professor opens it and tells him the subject he is to discourse upon. While I am waiting, a young man draws the American War of Independence. His ideas on the subject are somewhat misty. He knows of only two of its heroes, Washington and Franklin. The professor does not like his pronunciation of "Washington," and says those Americans over there, indicating myself and some of my compatriots, are laughing at him. He says you should try to get the true American pronunciation of the word, then repeats very distinctly for his edification Vash-ish-ton, with strong emphasis on the last syllable, and an almost imperceptible sound of the final *n*.

My turn comes and I draw literature of the time of Louis XIV. I soon get myself in trouble by making an odious comparison, having the hardihood to rank Molière below Shakespeare as a playwright. Monsieur smiles, shrugs his shoulders and asks me if I am English. I answer American. He says perhaps it is natural for me to take that view, but he evidently pities my ignorance. However, Monsieur La Monier is a gentleman, a man of distinguished learning, and my beau idéal of a Frenchman.

The written examinations in descriptive geometry and other mathematics are conducted on the same plan. The students are not allowed to communicate. I hear several things which sound strange to an American. One young man was told to move along, the inspector explaining that he might copy from his neighbour if he sat where he was. Another at the oral examination wished to show the "examineur" some problems in descriptive geometry which he had worked out. The examineur politely refused to look at them, saying, "Some one else may have done them for you." At the written mathematical examination was an American newly arrived, who knew absolutely no French. The inspector remarked that he did not write as he read the programme and asked him why. "Oui, oui," said the young man, this being his whole vocabulary. A moment later, noticing that he still did not write, he asked if he understood French. "Oui, oui," he replied. Again he did not write, and the inspector said, "You do not write. Why do you say, 'Oui, oui,' whenever I speak to you?" My compatriot gravely replied, "Oui, oui, oui," amid shouts of laughter. It is slow work waiting one's turn at the orals. Monsieur Salisis, the official examineur, is an old sea captain, with a bald head, which he wrinkles when he is not pleased, and he is seldom pleased during the examinations, but he has an unlimited supply of patience; it cannot be denied, he gives the men every chance. A student is at the board hopelessly perplexed; the old man gets up and says, "I will return in a few minutes; meantime you will have a chance to reflect." Hardly is the door closed when at least fifty of those present begin to give advice to the bewildered victim at the board and tell him how to do the problem. The examineur returns, and the poor fellow is more at sea than ever. "Je vous remercie," politely says Monsieur, as he writes zero opposite your name.

It is now half-past six of a Saturday afternoon. I have been sitting all day on a wooden bench with no back. The French Government does not pamper the pupils at the national school with luxuries. Monsieur Salisis shuts up his note-book and announces that the examinations will be resumed at seven o'clock to-morrow (Sunday) morning, and I realise that I am in a foreign land.

Finally the F's are reached. I momentarily expect to be called. The last man has failed, and the following one will be asked to do the same problem. That is a habit of Monsieur, and I am anxious for the chance. No, it is Monsieur Flacet. "Do you present yourself seriously?" asks the examineur. "This is the seventh time, and I don't believe you know any more now than you did the last time. 'Prenez un point, et un plan. Trouvez la distance entre ce point et la plan.'" This Monsieur is quickly thanked. Evidently he is not worth wasting much time upon, and my turn comes. I am told that I write very poor French, and I am asked where I came from. I say "America." "Amérique du nord ou Amérique du sud?" asks Monsieur. I reply, my dignity somewhat injured, "Lés États Unis." "Bien," he says, and adds, "if I had been in America as long as you have been in France I could have spoken English a great deal better than you speak French." But as he has no means of knowing how long I have been in France, I mentally do not assent.

At each of these examinations a certain mark is given, ranging from zero to twenty. Then the mark received in each subject is multiplied by a co-efficient supposed to represent its relative importance; thus the mark in architectural composition is multiplied by 12, drawing by 2, modelling by 2, mathematics by 5, descriptive geometry by 5, and history being 1.

Failure to pass in a single subject debars the candidate. The names of those who are received are posted in the order of merit, ascertained as described, and here at the threshold begins the system of competition which pervades every branch of instruction at the school—a system which puts the men on their mettle, and produces the most extraordinary results, both as regards quality and the amount of work accomplished.

Having successfully passed the examination, notwithstanding my bad French, I find my name posted along with twenty-nine others, all that remain of the army of nearly three hundred.

Once having gained admission the student is allowed an extraordinary degree of liberty. He may stay in the school until thirty years of age provided he accomplishes work each year which may easily be done in one or two months. He may choose his own professor in architecture, and may work or not as he feels disposed. To keep his name on the rolls he is compelled only to visit the school twice in the year. His advancement is solely by the honours, or values as they are

* A term of derision applied to Americans and English.

called, which he obtains. The school is divided into two classes, first and second, the latter being the lower. When a student has obtained the required number of honourable mentions or values, he is admitted without further ceremony to the first class. When he receives the proper number there he is allowed to choose a final programme of his own making for a building, after which he receives his diploma from the Government and becomes a full-fledged architect. If a young man is bright, he may expect to reach this goal in from eight to ten years after entry, but a large proportion fall out before the course is ended. Thus far no American has ever finished the course, though several have reached the first class.

LINE DRAWINGS FOR ILLUSTRATIONS.*

IT cannot be sufficiently borne in mind—I am speaking now to students who are not intimate with the subject—that to produce with pure black lines the quality and effect of lines in which there is some gradation of tone is no easy matter, especially to those accustomed to the wood engraver as the interpreter of their work. Sir John Tenniel, Mr. Du Maurier, and Mr. Sambourne, not to mention others on the *Punch* staff, have been accustomed for many years to draw for wood engraving and would probably still prefer this method to any other.

But the young illustrator has to learn the newer methods, and how to get his effects through direct photo-engraving. What may be done by the latter is sufficiently demonstrated in the line drawings which appear in our newspapers, magazines and books; I speak of those which are well printed and on good paper. Many German and French periodicals teach us what to admire and what to avoid. I am referring only to line drawing in this lecture, because it is the only process in relief which may be said to give any certain results, leaving the consideration of other developments of process work until next week. Line drawings are now reproduced on zinc blocks fitted for the type press at a cost of less than sixpence the square inch for large blocks. The first condition for this process is to draw in pure black lines on Bristol board, or smooth white paper.

Let us glance first at the ordinary handbook teaching, and see how far it is useful to the illustrator of to-day. The rules laid down as to the methods of line work, the direction of lines for the expression of certain textures, "cross-hatching," &c., are, if followed too closely, apt to lead to hardness and mannerism in the young artist, which he will with difficulty shake off. On these points Mr. Robertson, the well-known painter and etcher, writing seven years ago, says well:—"The mental properties of every line drawn with pen and ink should be original. . . . This strong point is sure to be attained unconsciously if an artist's work is simple and sincere, and not the imitation of another man's style."

"When the question arises as to what examples a beginner should copy who wishes to practise the art of pen-and-ink drawing, the difficulty will be to select from the great and varied stores of material that are everywhere to his hand. All steel and copperplate engravings that have been executed in line and all wood engravings are within the possible range of pen-and-ink drawing. I hold, however, that much time should not be occupied in the imitative copying of prints: only, indeed, so much as enables the student to learn with what arrangement of lines the different textures and qualities of objects may be best rendered."

There are, roughly, two methods of obtaining effect with a pen—one by few lines, laid slowly; and the other by many lines, drawn with rapidity. If the intention is to see what effect may be obtained with comparatively few lines deliberately drawn, we may refer to the woodcuts after Albert Dürer and Holbein, and the line engraving of Marc Antonio. The engraved plates by Dürer furnish excellent examples of work, with more and finer lines than his woodcuts. "Some of the etchings of Rembrandt are examples of what may be fairly reproduced in pen and ink, but in them we find the effect to depend upon innumerable lines in all directions. In the matter of landscape the etched plates by Claude and Ruysdael are good examples for study, and in animal life we may refer to those of Paul Potter and Dujardin."

Thus for style, for mastery of effect and management of line, we must go back to the old masters, to work produced generally in a reposeful life, to which the younger generation are strangers. But the mere copying of other men's lines is of little avail without mastering the principles of the art of line drawing. The skilful copies, the facsimiles of engravings and etchings drawn in pen and ink, which are the admiration of the young artist's friends, are of little or no value in deciding the aptitude of the student. The following words are worth placing on the walls of every art school:—"Proficiency in

copying engravings in facsimile, far from suggesting promise or distinction in the profession of art, plainly marks a tendency to mechanical pursuits, and is not likely to be acquired by anyone with much instinctive feeling for the arts of design."

There is much truth and insight in this remark.

In line work, as now understood, we are going back, in a measure, to the point of view of the missal-writer and the illuminator, who, with no thought of the possibilities of reproduction, produced many of his decorative pages by management of line alone (I am speaking of the parts of his work in which colour was not employed). No amount of patience, thought, and labour was spared for this one copy. What would he have said if told that in centuries to come this line work would be revived in its integrity, with the possibility of the artist's own lines being reproduced 100,000 times, at the rate of several thousand an hour? And what would he have thought if told that out of thousands of students in centuries to come, a few, a very few only, could produce a decorative page; and that few could be brought to realise that a work which was to be repeated, say a thousand times, was worthy as much attention as his ancestors gave to a single copy?

On the principle that "everything worth doing is worth doing well," and on the assumption that the processes in common use—I purposely omit mention of the olden systems of drawing on transfer paper, and drawing on waxed plates, without the aid of photography; also of photo-lithography; these have been dealt with in previous papers—are worth all the care and artistic knowledge which can be bestowed upon them, we would press, upon your artist especially, the importance of study and experiment in this direction. As there is no question that the "handwork of the artist" can be seen more clearly through mechanical engraving than through wood engraving, it behoves him to do his best. And as we are substituting process blocks for wood engraving in every direction, so we should take over some of the patience and care which were formerly given to book illustrations.

We cannot live, easily, in the cloistered silence of the past, but we can emulate the deliberate and thoughtful work of Mantegna, of Holbein, of Albert Dürer and the great men of the past, who, if they were alive to-day would undoubtedly have preferred drawing for process to the labour of etching and engraving; and, if their work was to be reproduced by others, they would have perceived, what it does not require much insight in us to realise, that the individuality of the artist is better preserved by making his own lines than by those of the engraver. To do this successfully in these days the artist must give his best and most deliberate (instead of his hurried and careless) drawings to the processes; founding his style to a limited extent, it may be, on the work of the old engravers, but preserving his own individuality.

But we must not slavishly copy sketches by the old masters, which were never intended for reproduction. We may learn from the study of them the power of line to express character, action and effect; we may learn composition sometimes, but not often, in a sketch.

As to copying the work of living artists it should be remembered that the manner and the method of a line drawing is each artist's property, and the repetition of it by others is injurious to him. It would be an easy method indeed if the young artist, fresh from the schools, could, in a few weeks, imitate the mannerism, say of Sir John Gilbert, whose style is founded upon the labour of fifty years. There is no such royal road.

But for the illustrator by profession there seems no artistic leisure in 1893, no time to do anything properly in this connection.

"It is a poor career, Blackburn," said a well-known newspaper illustrator to me lately (an artist of distinction and success in his profession who has practised it for twenty years), "you seldom give satisfaction—not even to yourself."

"It is an ideal career," says another, a younger man, who is content with the more slap-dash methods in vogue to-day, and with the income he receives for them.

There is another point to notice. The education of the illustrator in these days means much more than mere art training. The tendency of editors of magazines and newspapers is to employ those who can write as well as draw. This may not be a very hopeful sign from an art point of view, but it is a condition of things which we have to face.

In sketches of society the education and standing of the artist has much to do with his success. Mr. Du Maurier's work in *Punch* may be taken as an example of what I mean, combining excellent art with knowledge of society. His clever followers and imitators lack something which cannot be learned in an art school.

Much as we may desire to see a good artist and a good *raconteur* in one man, the combination will always be rare; and those editors who seek for it are often tempted to accept inferior art for the sake of the story. I mention this as one of the influences affecting the quality of illustrations of an ephemeral or topical kind, which should not be overlooked.

* From the Cantor Lecture (1) by Mr. Henry Blackburn, delivered before the Society of Arts.

It should be borne in mind that in drawing for reproduction by any of the mechanical processes (either in wash or in line, but especially the latter), there is more strain on the artist than when his work was engraved on wood, and the knowledge of this has left process-drawing principally in the hands of the younger men. They will be older by the end of the century, but not as old then as some of our best and experienced illustrators who keep to wood engraving.

I am touching now upon a difficult and delicate part of the subject and must endeavour to make my meaning clear. The illustrations in *Punch* have, until lately, all been engraved on wood (the elder artists on the staff not taking kindly to the processes), and the style and manner of line we see in its pages is due in great measure to the influence of the wood engraver.*

This refers to facsimile work, but the engraver, as we know, also interprets wash into clean lines, helps out the timid and often unsteady draughtsman, and in little matters puts his drawing right.

Now the wood engraver was apprenticed to his art and, after long and laborious teaching, mastered the mechanical difficulties. If he had the artistic sense he soon developed into a master-engraver and illustrator, and from crude and often weak and inartistic drawings he produced illustrations full of tone, quality and beauty. (He does so still to a limited extent, as many an author knows.)

From very slight material handed to him from a publisher the wood engraver would evolve (from his inner consciousness, so to speak) an elaborate and graceful series of illustrations, drawn on the wood block by artists in his own employ, who had special training, and knew exactly how to produce the effects required. The system often involved much care and research for details of costume, architecture and the like, and if not very high art, was at least well paid for, and appreciated by the public. I am speaking of the average illustrated book, say, of twenty years ago, when it was not an uncommon thing to spend 500*l.* or 600*l.* on the engravings of a book. Let us hope that the highest kind of wood engraving will always find a home in England.

I do not think the modern illustrator realises how much depends upon him in taking the place, so to speak, of the wood engraver. But the interpreting of tone into line fitted for the type press, to which the wood engraver gave a lifetime, will develop more and more upon him. We cannot keep this too continually in mind, for, in spite of the limitations in mechanically-produced blocks (as compared with wood engraving) in obtaining delicate effects of tone in line, much can be done in this direction in which the engraver has no part. That it is possible, by the common processes, to obtain effects almost equal to wood engraving may be seen in the illustrations to Mr. Andrew Lang's "Blue Poetry Book," by Mr. Lancelot Speed, in which many technical experiments have been made, including the free use of white lining by process. But more notable, from an art point of view, are the illustrations, produced lately at the Birmingham Municipal School of Art, by process-drawing, one of which I will show you on the screen.

All this, you will observe, points to the higher use of the process block than is generally allowed, to something, in short, very different to the thin, sketchy outlines and scribbles which are considered the proper functions of the "pen-and-ink artist."

But "the values" are scarcely ever considered in this connection. Mr. Hamerton makes a curious error in his "Graphic Arts," where he advocates the use of the "black blot in pen drawing," arguing that as we use liberally white paper to express air and various degrees of light, so we may use masses of solid black to represent many gradations of darkness. A little reflection will convince anyone that this is no argument at all.

The ideal illustration by mechanical means is where the principles of line engraving are followed to the utmost limits of pen-and-ink drawing, where the lines of the drawing do not intrude upon the effect—a drawing which can be reproduced with the least touching or "rouletting" on the block, and which requires the least "overlying" and "making ready" on the part of the printer.

Mr. Ruskin's advice in his "Elements of Drawing," as to how to lay flat tints by means of pure black lines (although written many years ago, and before mechanical processes of reproduction were in vogue), is singularly applicable and useful to the student of to-day, especially where he reminds him that "if you cannot gradate well with pure black lines, you will never do so with pale ones."

To "gradate well with pure black lines" is, so to speak, the whole art and mystery of drawing for the photo-zinc process, of which one London firm alone turns out more than a thousand blocks a week.

As to the amount of reduction that a drawing will bear with

advantage in reproduction it cannot be sufficiently widely known that, in spite of rules laid down, there is no rule about it.

Mr. Emery Walker, of the firm of Walker & Boutall, who has had great experience in the reproduction of illustrations and designs from the old books and manuscripts, will tell you that very often there is no reduction of the original; and he will show reproductions in photo-relief of engravings and drawings of the same size as the originals, the character of the paper, and the colour of the printing also, so closely imitated, that experts can hardly distinguish one from the other.

On the other hand the value of reduction, for certain styles of drawing especially, can hardly be over estimated. On these walls next Monday you may see drawings reduced to one-sixteenth the area of the original, some even more, and results obtained which could be achieved by no other means.

Again I say "there is no rule about it." In the course of years, and in the reduction to various scales of thousands of drawings by different artists, to print at the type press, my experience is that every drawing has its scale, to which it is best reduced.

A word as to sketching in line from life ready for reproduction on a process block. The system is, I know, followed by a few illustrators for newspapers (whose names might easily be mentioned), who, by incessant practice, have become proficient. They have special ability for this kind of work, and their manner and style is their capital and attraction.

But to attempt to teach rapid sketching in pen and ink is beginning at the wrong end, and is fatal to good art; it is like teaching the principle of pyrotechnics while fireworks are going off. And yet we hear of prizes given for rapid sketches to be reproduced by the processes. Indeed, I believe that is the wrong road, the baneful result of living in high-pressure times. Imagine any artist of the past—you might almost say any artist of the present—consenting to such a system of education.

Sketching from life is, of course, necessary to the student, but it should be done in pencil or whatever medium is easiest at the moment; but the lines for reproduction require thinking about, thinking what to leave out and how to interpret the grey of a pencil, or the tints of a brush sketch in the fewest lines. Thus, and thus only, the student learns the art of leaving out "the value of a line."

The tendency of modern illustrators is to imitate somebody; and in line drawing for the processes where the artist and not the engraver has to make the lines, imitation of some man's method is almost inevitable.

Let me quote an instance. The style of the late Charles Keene is imitated in more than one journal at the present time; the artists catching his method of line more easily than the higher qualities of his art, his *chiaroscuro*, his sense of values and atmospheric effect. I say nothing of his pictorial sense and humour, for they are beyond imitation. It is the husk only we have presented to us.

As a matter of education and outlook for the younger generation of illustrators, this imitation of other men's lines deserves our special consideration. Nothing is easier in line work than to copy from the daily press. Nothing is more prejudicial to good art or more fatal to progress.

THE NATIONAL PORTRAIT GALLERY, EDINBURGH.

AN important advance has been made in the decoration of the National Portrait Gallery, says the *Scotsman*, by the completion of the sculptured work of the handsome Gothic doorway of the building. The cost of this has been defrayed by the original donor of the Gallery, Mr. J. R. Findlay; and its execution by Mr. Birnie Rhind, A.R.S.A., has been superintended by the architect, Dr. Rowand Anderson, and a committee of the Board of Manufactures. In the design both the Marquis of Bute and Sir Noel Paton took a great interest. The scaffolding having been removed, the beauty of the work was for the first time revealed to public view on Friday. Many stopped to admire it; and many more, when they hear of its completion, will no doubt take an early opportunity of viewing it. The main features of the design may shortly be recalled. Rising from the apex of the gable, and projecting above the open balustrade at the wall head, is a female figure symbolical of "History." It is 5 feet 6 inches in height, and holds in the left hand a scroll, and in the right the recording pen. In a large quatrefoil panel below the apex of the gable has been carved a representation of the Scottish coat-of-arms, taken from a heraldic MS. of the fourteenth century, called the "Armorial de Gelre," which is preserved in the Royal Library at Brussels. This MS. contains the emblazonment of the armorial bearings of great princes and their subjects, and included among these is what is supposed to be the earliest representation of the Scottish arms extant. The figure of the lion demurely sitting on the

* One of the most accomplished of English painters told me the other day that, when he first drew for illustration, the wood engraver dictated the angle and style of cross-hatching, &c., so as to fit the engravers' tools.

top of a cushioned crown with a sword in his front right paw and of the lion on the shield are very quaint in character. The arms have no supporters. They consist simply of shield, helmet and crown, the flowing mantling of the helmet being decoratively elaborated for the due enrichment of the panel.

Immediately below this, and under the main arch over the windows, is a large panel, 15 feet wide by 7 feet high, the treatment of which forms the chief feature of the design. In the centre, seated on a throne, is a life-size female figure, representing Scotland crowned. In her left hand she carries a flag bearing the cross of St. Andrew, and in the right the orb of sovereignty. On her right is a group symbolical of Industry. A male figure in leathern apron, and resting his right arm on the handle of his hammer, represents a worker in metal; by his side is a female figure seated at a spinning-wheel, and holding in her hand the distaff. On the left is a group symbolical of Religion—the idea being to suggest that the virtues associated with religion and industry have raised the country to the proud position she occupies among the nations of the earth. In this latter group is a tall figure in flowing vestments, with his hands raised in the act of benediction, and kneeling at his side, as if in the act of prayer, is a female figure with draperies happily arranged. The simplicity and dignity of the design, the skilful grouping of the figures, and their admirable execution, are noteworthy features of this part of the work. Below the arched windows are three panels—the central about twice the size of the others. In it is a group of well-arranged figures, 3 feet 8 inches in height, representing the Fine Arts. Poetry, on the extreme left, looks thoughtful, chin on hand; Music carries an ancient harpsichord; Architecture, a scroll; Decorative Sculpture, a mallet; and Painting is symbolised by a Mediæval figure, recalling Fra Angelico, who stands with palette and brushes in hand. On the right or west side the group is devoted to the Sciences, with figures in varied attitudes, suggesting mathematics and geography, astrology, astronomy and medicine; and in the east or left side the panel contains representatives of craftsmen of the stone, bronze and iron ages—the implements they wield being studied from examples in the Antiquarian Museum inside. The spandrels of the four arches of the window have been filled in with diaper work, and the decorative effect of the whole design is extremely fine, and does credit to all connected with its inception and execution.

Two statues are still wanted to complete the decoration of the central doorway. The higher niches are now filled by the liberality of Mr. Thomas Usher and the late Mr. John Livingstone with figures of Malcolm Canmore and his Queen Margaret—the St. Margaret of Scotland—but no one has yet responded to the challenge the late Lord President Inglis gave in opening the building, to come forward and offer to defray the cost of statues of Wallace and Bruce, which under the scheme of decoration are to be placed in the lower niches. The Town Council hold in trust funds for the erection of statues to these two great champions of Scottish freedom, but the application of that money is so hedged round by absurd conditions that it may be feared it could not be made available for figures for the National Portrait Gallery. In this connection it may not be amiss to recall the main points of the scheme for the adornment of the façade of this fine edifice by effigies of eminent Scotsmen who lived before the present century. It was no part of the idea of the original donor of the building that he should hold himself responsible for the cost of the figures necessary to fill the 30 niches which are to be found on three sides of the galleries. The decoration of the central doorway was also to have been executed by outside aid, but the original donor subsequently consented to bear the expense of this important part of the work in order to relieve the bareness of the façade and to give the decorative scheme a good start. The selection of the names of thirty representative Scotsmen whose effigies are to fill the niches was a work of some difficulty and delicacy, but after it was drawn up it was hoped that existing Scottish families whose distinguished predecessors were included in the scheme would come forward and assist in this national work, and that public bodies might also see their way to do the same. The only nobleman who has yet responded is the Earl of Moray, and at his charges a statue to his distinguished ancestor, the Regent Moray—executed by Mr. John Hutchison, R.S.A.—was this week placed in one of the niches to the east of the doorway. It is proposed that along the façade there should be effigies of four Scottish kings—Alexander III., James I., James V. and James VI., and of these James VI. has been erected out of funds placed at the disposal of the Board of Manufactures by the committee of the recent Stuart Exhibition in London. On the right of the doorway the scheme provides for statues of Lord James Douglas—the good Lord James—of Knox and Buchanan, of Cardinal Beaton and of John, Duke of Argyll. There was a confident expectation that the Knox statue would have been forthcoming, but memorials to Knox somehow have a knack of coming to nought. The other figures it is proposed to group round the corner towers. At the south-east corner it is suggested that there should be

effigies of these representatives of Scottish literature—Barbour, Dunbar, Gawain Douglas and David Lindsay; the north-east corner is set apart for a group of scientific men—Napier, Stair Hutton, John Hunter and Watt; and the north-west corner to Admiral Duncan, Sir Ralph Abercromby, David Hume and Adam Smith. As to the last-mentioned Scotsman, a townsman of Edinburgh, to whom there is no public memorial in the city, it was hoped that some of the mercantile bodies in Edinburgh and Leith would have been at the cost of a statue to so eminent a financier; and, as these effigies are executed in sandstone, the price is by no means prohibitive. To the ladies of Scotland the façade is to be indebted for what will be one of its most attractive groups, which is to be placed in the large niche in the north-east corner tower. This will represent Queen Mary of Scots, with her friends, Bishop Leslie and Maitland of Lethington, on each side of her.

EARLY PAVEMENT TILES IN IRELAND.

THE last number of the Journal of the Royal Society of Antiquaries of Ireland contains a paper by Mr. W. Frazer, F.R.C.S.I., on early pavement tiles, in which he says:—

The employment of baked bricks and tiles for building purposes dates back in England to the period of Roman occupation. The Roman brick resembled in shape a large-sized flat tile, made from clay, with so much vitrifiable material in addition as would render the resulting mass, when strongly heated, almost everlasting. This is observable in the remains of Roman buildings still existing, and in the walls of numerous early English churches, where the old bricks were utilised after having passed a long and useful career in walls or houses of preceding ages. A Roman brick, by its peculiar shape and composition of well-baked and partially vitrified clay, may be considered the type from which our pavement tiles for church purposes were derived.

There is no satisfactory evidence that pavement tiles were introduced into Ireland earlier than the date of the Norman Conquest. They must have reached this country soon after that period for decorating the magnificent ecclesiastical structures which were constructed by the followers of Strongbow and their successors to replace our humble and modest native shrines. They would appear to have reached us across the sea, as a constant communication was kept up with England, principally through Bristol and Chester, and there is a remarkable resemblance observable between many of the patterns found on tiles in English churches and those got in Ireland; besides, we know they were manufactured in Britain, as the kilns themselves have been found there; whilst, so far as present information extends, no positive traces have yet been discovered of the presence of kilns for baking tiles on Irish soil. This statement must be considered open for future investigation, for there are some tiles of ruder and later fabrications which may possibly have been made on this side of the Channel.

Mr. Oldham, in a paper published some years since, which contained drawings of thirty-two Irish tiles, being the first attempt at giving representations of their patterns, when describing certain tiles found in St. Patrick's Cathedral, directed special notice to their being nearly identical with others obtained from Malvern Abbey, in Worcestershire. It is important to note that an intimate ecclesiastical connection is known to have existed between those places; for, in A.D. 1225, the year in which St. Patrick's became a cathedral establishment, the prior and brothers of Malvern the Less re-granted to it one-half of the tithes of Castleknock, which they obtained in A.D. 1221. A similar connection occurred between Newtown Abbey and Malvern; for, in A.D. 1224, the prior of the latter establishment granted to the Priory of SS. Peter and Paul, at Newtown, all the lands of Dunsink, and rents out of Keppock and Dobber, &c. (see "Archdall," p. 561). In the same paper he alludes to the discovery of the tile-works at Malvern, with fragments of broken tiles in various stages of the process of manufacture, but is inclined to claim for Ireland and Irish workmen, the genius which is undoubted, to fabricate similar tiles, and the positive manufacture of them which is yet unproven.

The majority of our specimens we obtained from the ruins of Cistercian houses, such as St. Mary's Abbey, Dublin (the Notre Dame De Ostmanby); from Mellifont, their parent settlement; from Bective, Douske, or Graignamanagh and Jerpoint. It is possible that if other establishments of the Order were examined they would afford additional supplies, but their use cannot be altogether limited to edifices under Cistercian rule. Mr. Oldham has given the oft-quoted extract from "Martène's Thesaurus Anecdotorum," communicated to him by the Rev. Richard Butler, of Trim, about one of the "Select Statutes" of a General Chapter of the Cistercian Order, A.D. 1210:—"Let the Abbot of Beaubec (in Normandy), who has for a long time allowed his monk to construct, for persons who

do not belong to the Order, pavements, which exhibit levity and curiosity, be on slight penance for three days—the last of them on bread and water; that the monk be recalled before the Feast of All Saints, and never again be lent except to persons of our Order with whom let him not presume to construct pavements which do not extend the dignity of the Order.” As Mr. Oldham’s paper is not easily obtained, it may be desirable to recall the words of this statute, which appears directed against the fabrication of patterns representing ludicrous or offensive subjects, rather than a display of narrow monastic jealousy of other ecclesiastical orders; still, it is certain that, excluding our cathedrals, it is in Cistercian and the allied Benedictine establishments that tiles are found in greatest abundance here.

When compared with the extensive series of decorative tiles belonging to the wealthy abbeys of England, those discovered in Ireland are very inferior in numbers and importance. For example, if we consider heraldic tiles alone, a series of the utmost interest for historic purposes, which are amply represented in the English series, the contrast is striking. With the exception of one great family—the Geraldines—there is not another example of heraldic blazonry found in our abbeys. An imperfect and broken tile obtained from Howth Abbey, of which Mr. Oldham gives a rough sketch, may display the arms of the St. Lawrences, but it will require better preserved specimens to determine this than such as are known at present.

A few large tiles of exceptional size and thickness were found in Dublin, which are about equal in surface to four ordinary flooring tiles joined together, and $1\frac{1}{2}$ the usual depth. They were decorated with bold patterns, and well glazed. The examples which first came under my observation were obtained from explorations carried on around Christ Church Cathedral, and others subsequently turned up in St. Audoen’s Church, High Street, Dublin. They bear a close resemblance in shape to the old Roman brick, and to those bricks still employed for building in Austria. Large and thick tiles like these were, it is believed, intended for attaching to walls. They are technically recognised by the distinctive name of *dossal* tiles. When they first reached my hands it was difficult to ascertain what they were intended for, as similar specimens had not been previously described in Ireland. They are much oftener obtained in English abbeys. F. Renaud, M.D., F.S.A., in a valuable memoir on the subject of “Tiles,” contributed to the “Transactions of the Lancashire and Cheshire Archaeological Society,” vol. ix., mentions that within the last twenty years a number of “wall or *dossal*” tiles have been removed from Malvern Abbey. This notice is of peculiar interest in association with the ancient connection already mentioned of Malvern with our St. Patrick’s Cathedral and Newtown Abbey.

A few tiles were also found at Christ Church Cathedral and St. Audoen’s, Dublin, about the size of ordinary specimens, though made of greater thickness; they were glazed uniformly on the surface with a thick, vitrified layer. The clay forming them was well burned and very hard.

The simplest process for decorating tiles was by painting some suitable pattern on the surface of the moulded clay. If previously baked it would become more absorbent. This was subsequently covered by an easily fusible compound, and strongly fired to vitrify the glaze—a process still employed for making earthenware. Such tiles, when subject to much traffic, would in a short time become worn down, and more or less defaced; they are therefore seldom obtained from explorations, unless in a damaged condition.

The ordinary process followed in tile works was forcing the damp clay into suitable moulds, having the intended designs raised in relief, so as to produce corresponding sunk impressions on the surface of the clay; it was then ready for being glazed and baked. The greater number of our better-preserved tiles were manufactured in this manner, and from the depth of the impressed lines they could bear a considerable amount of friction without becoming worn down.

A third variety of the “*encaustic*” tile consists of those in which sunken depressions of the intended pattern were got by stamping, and subsequently filled up to the level of the rest of the surface with pipeclay or some light-coloured marly earth before baking and glazing. Numerous handsome designs resulted from this procedure. Such tiles wore fairly well, and presented several advantages for decorative purposes.

In a fourth form of tile the pattern, was elevated above the surface of the clay, projecting more or less. This procedure would enable an artist to display skill and taste in his work, but did not produce tiles capable of enduring rough usage or heavy wear.

The vitrifiable material, used for glazing over the surface of the baked clay, could be modified in composition to produce different tints of colouration. It consisted of glass or its components, with a considerable amount of oxide of lead, which required comparatively moderate temperature for its fusion. When this glaze has undergone partial decomposition by lying imbedded in damp soil charged with putrefying or decaying

matters, we find it is liable to acquire a dark or blackish hue from the production of black sulphuret of lead. The earlier descriptions of English earthenware appear to have been covered with some kind of salt glaze over colour, as they are obtained unchanged in their appearance after centuries of exposure.

MUNICIPAL INSIGNIA.

A CONVERSAZIONE was lately arranged by the members of the Lancashire and Cheshire Antiquarian Society in Manchester. A collection of municipal insignia was lent for the occasion by the Corporations of Manchester, Lancaster, Chester, Carlisle, Macclesfield, &c.

An address was delivered by Chancellor Ferguson, F.S.A., on “The Dignity of a Mayor, or Municipal Insignia of Office.” He said that under the term “municipal insignia” he included rods or wands of office, maces both great and small, oars, swords of honour or state, caps of estate or maintenance, chains and badges both of mayors and other officials, rings and robes, halberts, horns and constables’ staves. Few people have the most remote idea of the amount of artistic wealth, of antiquarian treasure and of historical relics possessed by and lying hidden away in the strongholds and chests of the various corporate bodies of this kingdom. The corporations are rich beyond compare in works in the precious metals, in emblems of state and civic dignity, in relics of Mediæval pageantry, in badges and insignia of various offices, and in seals and records of different periods. The neglect with which these treasures have been treated has been astounding. The reformed corporations of 1837 despised municipal pageantry; many actually sold their insignia for the best prices they would fetch “as relics of the barbarous ages.” Others discarded the use of their insignia and their existence was almost forgotten. A reaction, however, set slowly in. The Great Exhibition of 1851 caused some places to provide their mayors with chains in order to attend at the opening. Other places were induced to buy new or refurbish up old insignia on the occasions of royal visits. During the International Exhibition of 1862 a loan collection, but on a small scale, was formed, to which several corporations contributed their maces and other objects. In the year 1874 the Royal Archaeological Institute presented to the Mayor of Exeter a chain of office in commemoration of the Congress held at Exeter in the previous year. This excited so much interest that the council of the Institute in 1875 entertained the idea of holding in London an exhibition of chains of office and other municipal insignia. A committee was formed and circulars were sent to nearly 600 municipal bodies, asking for information as to their insignia. About 300 replies were received; but in those about one-half neglected to describe their insignia, or contented themselves by saying they were “old and of no value.” Some of those who thus replied possess most valuable insignia. In 1888 an exhibition of municipal insignia was held in the rooms of the Society of Antiquaries of London, at which, by the courtesy of several mayors and corporations, a fine and typical series of 130 maces and twenty-four swords of state, four silver or silver-gilt oars and one wooden, and other articles were exhibited. But this was surpassed by the magnificent show which was got together by the Lord Mayor of London in the Mansion House last July, on the occasion of the visit of the Royal Archaeological Institute to London. About 170 maces were brought together, or 200 if we include the maces of the Wards of London; twenty-seven state swords, four caps of maintenance, fifteen silver oars, together with a number of the mayors’ chains. Many of the things thus brought together were of the most remarkable interest and beauty. Different views have been held as to the origin of the mace. Some have supposed that the regal sceptre, the ecclesiastical virga or virge and the civic mace all had their emblem of straightness and integrity of rule, consisting of a plain slender rod anciently borne before kings and high public functionaries, and retained to the present day as an official badge by sheriffs and attendants in courts of justice and by some mayors. The other is, that the civic mace is derived from the military weapon of that name. Chancellor Ferguson, after describing the maces, called the attention of the members to some of the maces on the table, amongst them being the great mace from Congleton, which is silver gilt, and is $41\frac{1}{4}$ inches long (an almost unaltered Commonwealth mace made in 1651, altered in 1661), and the silver mace from the same place of the time of James I., and which is of an uncommon type. The Wigan silver-gilt mace, 41 inches, is a fine example of Commonwealth pattern made in 1657 and altered at the Restoration; and their copper mace, 42 inches, is of a plain Commonwealth pattern, also altered at the Restoration. The Clitheroe mace was given to the town by General Monk at the Restoration. The lecturer then gave a description of the state swords. Amongst those on the table was one from Chester, of fine early fifteenth-century work. The lecturer concluded with a description of oars, caps of maintenance and civic robes.

Carriage-way Pavements for Large Cities.

SIR,—Referring to the paper read by Mr. Isaacs on the above subject, a report of which appears in your issue of December 22, without wishing to enter into a discussion, we would like to say we think Mr. Isaacs has overlooked a very important fact in connection with West Australian hard woods, at least those which have been laid in London, and that is, that they belong to the eucalyptus order, and are natural disinfectants.

That the blocks contain eucalyptus we have proved, and it seems to us, therefore, that the highest standard sought, viz. "on the score of public hygiene," is met in these woods, and they should therefore be placed first on the list.

In the summing up on the "comparative merits and demerits," Mr. Isaacs classes all woods together. We are willing to allow the position he has given to soft woods, viz. last, "on the score of public hygiene," but we certainly must take exception to the West Australian hard woods being coupled therewith, for as a fact they are as far apart as they possibly can be.

Our wood is a hard, non-absorbent and sanitary wood; soft wood, on the other hand, is a spongy, absorbent, and therefore unhealthy wood. The allusion Mr. Isaacs makes to the offensive smell given off by the soft woods we venture to say he cannot apply to our hard woods.

One has only to observe the two woods to arrive at conviction. Within twenty-four hours after wet the Australian wood is, generally speaking, dry; not so with soft wood, which retains the moisture for days, almost weeks after.

Out of the seven lines laid down by Mr. Isaacs at his initiation of the subject as essentials, we claim the whole seven for our woods, viz.:—

1. "It must be a sanitary pavement, and as noiseless as possible." We have answered this above.

2. "It must be safe for horses," &c. We hold that these Australian woods afford a good foothold for horses, though, like all other roads in greasy weather, they require sanding—we should prefer for ours merely washing. Even in dirty weather the Australian hard wood roads are not more slippery, except at the points where they meet a granite, soft wood, or macadam road, and there the slipperiness is caused by the mud taken off these other roads on to the hard woods.

3. "It must be as free from dust and mud as possible." Observe a "Jarrah" road in dry weather. We venture to say the small quantity of dust will compare favourably with asphalt, whilst it leaves the soft wood road far in the rear.

4. "It must be economical as regards its first cost, maintenance and cleansing." Though the Australian wood may be dearer in the first place, it is, by reason of its durability and consequent less need for repair, economical in the end.

5. "It must be durable." As to the Australian hard woods, we don't think any surveyor has had sufficiently long test to bring comparison to bear, but so far as tests could be made, we don't think we shall be far behind other materials, not even excepting granite. We will give an instance. At Charing Cross our "Jarrahdale" wood was down nearly four years on the spot where before soft wood had to be replaced in nine months. Therefore, if the same soft wood would wear in an ordinary road, as Mr. Isaac quotes, nine years well, a simple calculation will give "Jarrahdale" a life of forty-eight years. How's that for durability? Then, again, there is a piece of roadway at the foot of Westminster Bridge laid with our wood, has been down about five years, has had no repairs, shows no sign of wear, has every appearance of seeing most of the present generation out.

6. "It must be easily cleansed and of a non-absorbent nature." We explain above about the non-absorbent nature, and it certainly is capable of being easily cleansed.

7. "It must admit of being readily taken up," &c., which goes without saying. We notice Mr. Isaacs refers to the portions of West Australian woods taken up at Kensington. We can only answer this by saying they are laid in other parts of Kensington and seem to give every satisfaction. Considering that there are some ten miles of "Jarrahdale" roads laid in London, it seems rather remarkable that at a place where only a few yards are down there should be complaints, yet not at any other parts; we cannot explain and therefore will not attempt.

Mr. Isaacs, we notice, draws a comparison between the prices of yellow deal and Australian hard woods to the detriment of the latter.

The higher price of our wood may be accounted for by the fact that it is cut free from the heart, "sap, shakes, knots and other imperfections."

Now Mr. Isaacs says blocks should be laid free from these imperfections. We ask, Are yellow deal blocks so laid? We

further ask, If they are, would the price of Jarrah bear such an unfavourable comparison? We think if deal blocks were bought without knots and other imperfections the price would run "Jarrah" very close.

Pardon the length of our remarks, but we think, in justice to our "coming colony," one of their chief products should not be set down on a par with an inferior wood and so condemned for that purpose for which it is so eminently adapted.—Your obedient servants,

The Rockingham Railway and Jarrahdale Timber Co., Lim.
F. CHAPMAN.

The Pentagon in Decoration.

SIR,—The simplicity and beauty of the figure below is so obvious that any description is unnecessary, beyond the remark that it is a repeating pattern, and that by making it a centre with five other similar ones based on the five sides, a beautiful ceiling or other design is the result. The colours of the centre may be red 1, blue 2, green 3, yellow 4, white 5, brown 6—modifica-

tion to suit artistic taste. The colours of the other five may be the same or counterchanged, as indicated by the numbers. It will be observed that though the figure consists of right or straight lines only, the circle is developed sufficiently to give beauty to an otherwise rigid design of right lines. When developed a triangular piece is formed between the five pentagons, and may be filled up by continuing the lines across it and colouring differently.

H. TRAVIS.

5 Beaconsfield Terrace, Sydenham.

GENERAL.

The Reconstruction of the Opéra Comique has been at last undertaken, in spite of the dissatisfaction caused by the selection of plans.

M. A. Mercié, the sculptor, has, after some hesitation, undertaken the commission for the Gounod memorial, which is to be erected in Paris.

The Late Mr. Aubrey Bowen, of Melbourne, has bequeathed sufficient money to Mason College, Birmingham, to found six scholarships of 100*l.* a year each for the promotion of the study of metallurgy, civil, mechanical and electrical engineering, and chemistry.

A Competition was lately arranged among local architects for plans for a Board school in Stoneyholme, Burnley, to cost 10,000*l.* Mr. Murgatroyd, the assessor, has awarded the first prize of 20*l.* to Mr. Quarmby, architect, and the second (10*l.*) to Mr. Dunkerley.

The "Holy Carpet" from the mosque of Ardebil, which was completed about A.D. 1540 by Maksoud of Kashan, has been temporarily placed in the Indian Museum at South Kensington. It cost 2,500*l.*, of which sum one-third was subscribed by Messrs. A. W. Franks, W. Morris and Steinkopff, the rest being paid by the Department.

Messrs. Jeremiah Head & Son have transferred the headquarters of their consulting practice in civil, mechanical and metallurgical engineering, hitherto carried on at Middlesbrough, to 47 Victoria Street, Westminster. The Middlesbrough office will be retained as a branch.

The Manchester Corporation have purchased Mr. John Cassidy's bronze statuette, *The Digger of the Manchester Canal*, for the permanent collection at the Art Gallery.

Mr. Nisbet Blair, C.E., borough engineer and surveyor of St. Pancras, has joined the consultative council of the National Building Exhibition.

The Architect.

THE WEEK.

THE election of three Associates of the Royal Academy on Tuesday will not give rise to more than the customary amount of disappointment. The success of Mr. J. S. SARGENT testifies that the Americans have a claim on the Academy which was created prior to the separation of the Western colony. As the artist was born in Florence and acquired skill as well as reputation in Paris, he may not care to be put down as an American citizen. Mr. SARGENT is a representative of the new system of æsthetics, and his election is a victory over the ancient school. Mr. FRANK BRAMLEY, as a member of the Newlyn School, may be also considered by some people as belonging to a revolutionary class, but if compared with Mr. SARGENT's experiments his paintings will be found to be cast in an antique mould. He can appeal with success to the emotions of the crowd, and we ought to be thankful he exercises so much restraint. It would be easy for him to rival Mr. MARCUS STONE in popularity. Mr. FRAMPTON, as a sculptor, has shown his competence, but where are the commissions which he merits? His election is important, for it denotes that architectural decoration is not to be classed with cemetery masonry. It may be said that architecture was passed over at the election. There are, however, seven architects in the Academy, and it cannot be said that any architect is able to do much to increase the profit of the annual exhibitions, a consideration which cannot be overlooked.

THE advantage of burning as an economical means of ridding the world of the costliest of architectural fiascos—the Chicago World's Fair—was demonstrated on Monday night. Mr. BURNHAM's proposal is, therefore, likely to be accepted. The columned peristyle, the casino, the music-hall and the structure for the useful arts have vanished into nothingness. The exhibition was inspired by the greed of the people of Chicago who, under the pretence of promoting arts and industries, were enabled to fleece a good many visitors. It was characteristic of the citizens that they should obstruct the firemen when endeavouring to save some of the objects that remained in the structures, and that when the strangers' property was destroyed they tried to make it out as valueless. Whatever else they may do, international exhibitions do not promote commercial morality. We suppose no time will be lost in clearing the ground of the remaining buildings, but it would be more advantageous for people at a distance if tourists who visited the exhibition could be persuaded to refrain from trying to convince those who wisely remained at home that the World's Fair was an event in universal history and inaugurated a new era.

MR. J. W. BUTTERWORTH is having a window prepared in Munich for the Stationers' Hall, to commemorate his holding the office of Master of the Company. The subject is the visit of EDWARD IV. to CAXTON at Westminster. It is an odd way to recall two—or shall we say three?—English worthies. There will be no necessity to put the customary announcement "Made in Germany" on the window. That would be evident in any case, but it is understood that for the BUTTERWORTH memorial especially strong colours are employed, either to signalise its importance or to gratify the peculiarities of the worthy Stationers.

A REPORT has been prepared by M. ANTONY VALABRÈQUE for the French Minister of Public Instruction, concerning the examples of French eighteenth-century painters which are to be found in German galleries. It is needless to say the delegate was struck with those which are to be seen at Sans Souci. FREDERICK THE GREAT was not unwilling to make war on the French, but in literature and art he held they were irresistible. Apparently he would have sacrificed a part of his renown as a warrior to see his name printed in a list of French rhetoricians. Every tourist will remember the Frenchified character of the king's rooms, the French books (there is not one by a German in the bookcases), the French statuettes and other knickknackery

which abound, so that it is difficult to resist the impression that the place must have belonged to some *petit maître*. FREDERICK had a penchant for pictures by LANCRET and PATER, CHARDIN, COYPEL, &c. There is a series of fourteen compositions by PATER from SCARRON'S "Roman Comique," and about forty works by that artist are to be seen at Potsdam. We must say his French pictures do more credit to the king's taste and judgment than those belonging to other schools. There is a big gallery to which the visitor descends, which the courtiers probably declared exemplified the *Gusto Grande* at its best, but it contains more daubs than will be found in any gallery of the size in Europe, with the exception, of course, of the gallery in Hanover, in which the lowest depth of royal connoisseurship was reached.

AMONG the papers read at the meeting of the Society of Antiquaries of Scotland on Monday was one by Mr. ALEXANDER HUTCHESON on a bell which is in the church of Kettins, Forfarshire. The late Mr. JERVISE, in his "Epitaphs and Inscriptions," had given a version of the inscription on the bell, but had not ascended the belfry to verify it, and the reading was unintelligible. With the assistance of Mr. J. W. MUNRO, inspector of schools, Mr. HUTCHESON had obtained a correct transcript of the inscription, which was a curious one:—"Maria Troon Es Minen Naem, Meester Hans Popenreider Gaf Mi. Anno Domini MCCCCXIX." It is evident that the bell is Dutch and that it belongs to pre-Reformation times. But the reason for giving to the bell the name of Maria Troon and the connection of Hans POPENREIDER with the parish of Kettins were not so easily discovered, although it had been ascertained that a Hans POPENRUYTER was principal gun-founder to King HENRY VIII.

THE exhibition in the Manchester City Art Gallery, which came to a close on Saturday last, obtained more than the average amount of support. Twenty-seven oil-paintings, twenty-three water-colour drawings, and one example of sculpture were sold, which were valued at 3,961*l.* 1*s.*, as against fifty-nine sold in 1892, valued at 2,029*l.* 1*s.*, and fifty-four sold in 1891, valued at 1,509*l.* 1*s.* The total number of visitors has been 87,574, against 77,272 in the season of 1892 and about 57,000 in 1891. The present season's total has been made up as follows:—23,617 visitors have been admitted by payment, 12,764 by season tickets, and 51,193 have been admitted free of charge. The number of season tickets sold has been 1,155, against 1,144 in 1892 and 851 in 1891. The number of catalogues sold has been over 8,000, or about the same as last season. The spring exhibition of works by members of the Manchester Academy of Fine Arts will be opened on February 20.

IT cannot be too generally known that a contractor who undertakes the construction or repair of a road is likely to be held responsible for accidents which may arise, rather than the owners of the adjoining houses or the local authority. A case which settles the legality was tried in the Birmingham County Court on Tuesday. A mechanic, who was the plaintiff, stated that one evening in August he was passing along Green Lane, which was being constructed by a firm of contractors. As the road was not sufficiently lighted he stepped in the darkness on some dislodged setts, which formed part of the gutter and kerbing, and was thrown violently down, sustaining injuries to his right hand which had incapacitated him from following his employment since. Mr. FITZMAURICE, one of the contractors, swore that the setts were properly placed and rammed, and his counsel also argued defendants could not be held liable, inasmuch as the road either belonged to the Corporation, in which case they would be responsible, or it was the property of the inhabitants, in which case the general public would have no right of way. The judge, however, declared that the law was that so long as a road was in the hands of contractors for construction or repair they were liable for any negligence. The fact of a road not having been taken over by the Corporation did not affect its public character unless a notice was put up forbidding persons to make use of it. The plaintiff claimed 50*l.*, but the judge considered that 29*l.* 1*s.* would be adequate for the damages.

ENGLISH RENAISSANCE.*

THE excellent work on the Renaissance buildings in England has been completed in a manner that is creditable to the authors and publisher. Their promises have been more than realised. Instead of 122 large plates and 100 illustrations in the text, they have given 145 of the former and 180 of the latter without extra cost to the subscribers. The whole of the plates have been produced in uniform style, a result which is not easily insured with a photographic series.

The subjects in the sixth part are:—Moyns Park; Wyvenhoe Cottage; Trinity College, Cambridge; Caius College, Cambridge; King's College, Cambridge; Merton College, Oxford; The Schools, Oxford; Convocation Room, Oxford; Wadham College, Oxford; St. John's College, Oxford; Jesus College, Oxford; Bramshill; Chastleton House; Charlccote; and Wollaton Hall. The collegiate examples form, as it were, a dignified close, like DRYDEN'S "dying fall," for the series. A few words on the plates may be allowed.

Moyns Park, in Essex, is one of the great houses erected by successful lawyers which have been illustrated by Mr. GOTCH. By some freak of economy or respect for precedent Baron GENT built his mansion without destroying an older residence which stood on the site, taking care, however, to completely veil it by his loftier buildings. The front shows wide bay windows which are not surmounted by gables, the latter appearing between them over ordinary windows. The alternation has a rhythmic effect which is pleasing. Ivy and lichens cover the greater part of the front, and impart repose and interest to it.

The Cottage at Wyvenhoe, also in Essex, is doomed to demolition. It is a remarkable example of plasterwork, and we might suppose from the extent of the ornamentation that the little dwelling belonged to a plasterer who utilised his spare hours on its adornment. Some details of plasterwork about Ipswich are also given.

The fountain in the quadrangle of Trinity College, Cambridge, is a well-known object. It was erected between 1601 and 1612. Two English carvers, WYAT and THORPE, are recorded as working on it, but the name of the designer has been forgotten. The fountain, consisting of two shell basins, stands under a canopy, the arches being supported by Ionic columns. The hall of the college was designed by RALPH SIMONS, and was raised in 1604-5. The screen is a characteristic example, and the details are as sharp as if they were cut in basalt. Some parts appear as after-thoughts—such as the cherubs' heads in the spandrels, but the impressive effect cannot be questioned.

DALLAWAY, in describing the gate of honour at Caius College, says:—"At Caius College a specimen of the members of Palladian architecture in miniature was first exhibited to the university in a gateway designed by THEODORE HAAVE, or CLEVUSSIS, an architect, sculptor and painter of eminence in the reign of Queen ELIZABETH. It nearly resembles the tombs of that age, which were composed of various marbles formed into columns, entablatures and alcoves upon the Italian plan, then newly introduced into England; and it rests upon the door-case as a superstructure. Much as it was once admired, its present claim to notice is merely that of curiosity." The structure may be said to consist of three independent parts, viz. a sort of triumphal arch below, a miniature temple above it and a hexagonal superstructure. There is little unity in the whole, but it is not without interest as suggesting an early attempt at combining Italian examples. FERGUSON declares it to be "the most complete specimen of Classical art which was at that time to be seen in England." The screen in King's College Chapel is not overpraised by Mr. GOTCH when he says:—"It is, indeed, the finest example of woodwork in England, if not out of Italy, and one might even go further and say that in its masterly simplicity of design it is to be preferred to a great deal of Italian work, in which it is evident the facility with which the artists wielded their tools became a snare unto them. It is not known who was the designer or who were the workmen. It has been conjectured that

HOLBEIN might have designed it, but it is quite certain that foreign carvers must have been employed to execute it, for although there is an English feeling about the panels, it would have been impossible for English workmen to have acquired the mastery of a foreign style of ornament so early as 1531-35, when the screen must have been designed." The stalls in the chapel are less elaborate, but they reveal equal dexterity in dealing with refined Italian detail. More vernacular is the carving from St. John's and Clare Colleges and the ornament seen in some of the stained-glass at Cambridge.

The work at Oxford fittingly begins with the entrance to the court of the Schools, now the Bodleian Library. As is well-known, above the gateway there are four storeys, each having coupled columns. The uniformity of the storeys in size becomes monotonous, and an excessive load is imposed on the gateway columns. The entrance to Merton College was conceived in a similar spirit. Mr. GOTCH truly says:—"The whole composition is artificial; there is nothing in the back to justify this important feature; the door leads to no special series of rooms and it is evident that the design was merely applied as an ornamental centrepiece to one side of the quadrangle, the remaining sides being treated in the simple manner visible on either hand of the principal feature." The library at Merton is another example of English woodwork. Two plates are given of Wadham College. The entrance was evidently erected at a time when a few superimposed storeys without any use were supposed, as long as there were pilasters and sculpture, to represent the height to which architectural taste could soar. The screen appears to be joiner's work, ornament being introduced in a manner which is not satisfactory. Opinions will always differ about the value of INIGO JONES'S work at St. John's College. DALLAWAY says:—"Under the patronage of Archbishop LAUD, INIGO JONES was first employed at Oxford in 1638. He built the arcades and porticoes in the inner quadrangle of St. John's College, over which is a gallery of just proportions. They are in his first manner, and copy the faults rather than the excellences of his great master, PALLADIO. The busts between the arches, and the heavy foliage and wreaths under the alcoves, are exuberant and unclassical." These words express the ultra-classical spirit, but we have grown more charitable, and JONES'S work has a right to be judged by an English as well as an Italian standard. Mr. GOTCH, with more justice, says that "the garden front has a strong flavour of the earlier Renaissance about it, and is in itself a beautiful composition, and that even the courtyard keeps largely to the old lines. It is very interesting," he adds, "to see, as we here see, the apostle of the fully-developed Renaissance using the methods of the early masters—INIGO JONES painting with JOHN THORPE'S brushes."

The screen in Jesus College is another of those laborious examples in which we find few signs of artistic inspiration. Mr. GOTCH gives sundry other examples of detail from Oxford colleges, and he is warranted in saying that "enough has been illustrated to show how the Renaissance movement affected the Universities," and to make good the opinion indicated at the outset that "although the student of the subject must not neglect them, yet he would be unwise to take the work they offer as being typical either of date or of excellence of design."

Bramshill, in Hampshire, is a good example of Jacobean. It is commonly supposed that JOHN THORPE was the designer, but Mr. GOTCH does not consider the authorship is more than problematic. The central part of the front is the most elaborate. There is an arcade below, in which is the entrance. Over it is a circular oriel flanked by terminal-pilasters; above it are two blank windows and niches with pilasters; and finally there is a sort of cresting, which is said to represent the badge of the Prince of WALES. Bramshill is one of the best examples of a brick residence in the collection. Chastleton House, in Oxfordshire, is of stone, and is more quiet in style. It is well adapted to be shown to foreigners as evidence of the conditions of old English life. In describing it Mr. GOTCH writes:—

Altogether there is about the place an air of unchanged antiquity particularly pleasant and restful, and very refreshing in those days when so many dwellers in old houses are concerned with the desire to be

* *Architecture of the Renaissance in England.* By J. Alfred Gotch, F.S.A., assisted by W. Talbot Brown. Part VI. (B. T. Batford.)

"smart." Inside the character of the exterior is maintained. Many of the rooms have lost their ancient ceilings and woodwork, but no structural change of any importance has been made, and the plan to-day is pretty much what it was when the house was built. The hall retains its oak screen and dais, the little parlour has panelled walls and a good plaster frieze, the drawing-room upstairs has its old chimney-piece and richly panelled walls and elaborate ceiling. Several of the bedrooms have either interesting chimneypieces or ceilings or panelled and tapestried walls. Old furniture abounds in every room; old books—some of great rarity—remain in the library. Some of the ancient jewellery depicted in the family portraits is still treasured by the lady who owns the house, a descendant of the builder. It would, indeed, be difficult to find a house which has come down to the present day with less of the change which constant residence necessitates.

Chastleton House is believed to occupy the site of a house belonging to CATESBY, the leading agent in the Gunpowder Plot. He sold the estate to WALTER JONES, who erected the existing mansion. It is built on a symmetrical plan round a small court. The detail is effective, but apparently it will not sustain close examination. One of the photographs represents the Gate House at Charlote, which is in one way more interesting than the mansion where SHAKESPEARE appeared in custody as a poacher, as it has been little altered.

The last of the mansions is Wollaton Hall, one of the stateliest of English homes. It is an example of a building that was planned with the object of impressing the spectator with the greatness of the owner, and in consequence it must have been at all times inconvenient as a residence. But it was, however, worth enduring privations in order to secure so grand an air for a private mansion. FERGUSON says a rich Gothic feeling pervades it, running occasionally into excesses bordering on the grotesque, but he admits that the lower part of the design is probably the happiest conception of its age in this country, and if repeated with a purity of detail as we could now apply to it, would make a singularly pleasing type for a residence of an English nobleman. The building was erected by Sir FRANCIS WILLOUGHBY in 1580-88. His master-workmen came from Italy. JOHN THORPE prepared a plan of the building, which has been carried out in all essential features; but there is a tomb in Wollaton Church of ROBERT SMYTHSON, gent., who is described as "Architector and Surveyor unto the most worthy House of Wollaton, with diverse others of great account."

The difficulty which arises in the case of Wollaton is not exceptional. Construction was organised differently in the sixteenth century from what it is to-day, and therefore we cannot expect correspondence between either the highest or the lowest offices in the two periods. On this subject Mr. GOTCH has some pertinent remarks. He says:—

It must be always borne in mind that those days were widely different from ours. In the present day, if we are struck with the beauty of a building, it is a matter of no great difficulty to ascertain who is the architect, and in all good work we may with safety conclude that it is to him that we must attribute the happy faculty of giving to his materials the forms and combinations which delight us. It is he to whom the rare and crowning glory of design belongs; the workmen are but the ministers of his will. Not so in the period under review. The architect, as we know him, did not exist. The term, indeed, was hardly known. It is only used once by Shakespeare, and then only figuratively. It is important to bear this in mind. To talk of the "architect" of Kirby, or Hatfield, or Wollaton is really misleading. There was no such functionary. There was some one who rough-hewed those buildings, but it was left to others to shape them. There was in most instances an individual who supplied a plan, and often also an idea of how the building was to look outside, and therefore this individual's influence was of considerable importance, since he it was who gave form and shape to the structure; but he was not what we think of as an architect. He was called the surveyor, and, the surveyor's share being done, his work was elaborated by numerous and insignificant artisans. Having before them the surveyor's general notion of the building—that here was to be a plinth, there a stone cornice and there a balustrade; that between those windows should be a niche, and between the others a pilaster—it would then seem, so far as we can at present ascertain, that the masons set to work to carry out these ideas in the actual building, themselves supplying the profiles of the cornices, and the patterns of the pilasters, and the sections of the mullions. Not unfrequently the employer stepped in and said, "Inscribe me here such and such words;" or, "Carve me there mine arms, and those of my lady," which accordingly the mason did to the best of his ability; and when he knew nothing of Latin, or was ill-acquainted with heraldry, the result was apt to fall short of what was intended.

Mr. GOTCH takes JOHN THORPE as the typical surveyor and designer of houses during the reigns of ELIZABETH and JAMES. He analyses the book of sketches in the Soane

Museum, and points out how few of the drawings relate to working details. There is but one section through a house and it may be concluded that THORPE was careful not to meddle overmuch with the privileges of the workmen. Some of those men may have travelled or were able to see foreign books in which Italian and French works were illustrated. Foreigners were employed in England, but their numbers declined after the reign of HENRY VIII. It is possible, however, that drawings or models were imported from abroad. For example, we find in the narrative of the travels of COSMO III. in 1669,* that Althorp was built according to a model obtained from Italy, and therefore, adds the Italian complacently:—"It may be said to be the best-planned and best-arranged country seat in the kingdom, for although there may be many which surpass it in size, none are superior to it in symmetrical elegance." The English workmen were not, however, over loyal to Italian or any one country's patterns. There was a good deal of eclecticism in the air at that time. Just as the unities were set aside by the dramatists, the plasterers, joiners and carvers seemed to consider that Italian forms were made more rich and strange or more English in character if they were adorned or united with features that were derived from the Netherlands.

This compound character is one of the charms of the buildings which Mr. GOTCH has selected for illustration. They are not Italian or French or Flemish in style, although the influence of those countries may be traced in them. They correspond with many other things in England which are more or less derivative, but have attained national qualities during the transforming process. The buildings may, therefore, claim to be essentially English, and on that account it is satisfactory to find that the two volumes have been produced in a style which does credit to the country. In any foreign, royal or imperial libraries the "Architecture of the Renaissance in England" would hold its own among the most beautiful volumes relating to art.

Mr. GOTCH mentions that however copious the illustrations may be, the text has only touched the fringe of the subject, and nothing would give him greater pleasure, should time and opportunity permit in the future, than to deal with the Renaissance in England in a fuller manner. We are certain that among the numerous subscribers to the present work there will not be found one who will not desire to see the speedy realisation of the intention.

BERNARD VAN ORLEY.†

THERE is evidence enough to show that the Flemish painter, BERNARD VAN ORLEY, was at one time prized in England, and there are grounds for supposing that he visited this country. The single example of his style, *The Magdalen Reading*, in the National Gallery, came, it is true, from a French collector; but in Hampton Court his *Christ Healing the Sick* is an ancient possession, and there are works by him at Arundel Castle, Chatsworth, Althorp, Kedleston, and other houses. The Liverpool Gallery contains one of his pictures. Six of them were hung in the Manchester Exhibition of 1857. Another circumstance that brought him into association with England was his superintendence of the Vatican tapestries, for which the cartoons are now at South Kensington. VAN ORLEY was one of RAPHAEL's pupils. That he was respected by the master is evident from such a duty. He was also a renowned glass-painter, and we suppose there are few of our readers who have not admired his windows in the church of St. Gudule, Brussels. His paintings are to be seen in the principal galleries of Europe.

Unlike the majority of painters in all ages, BERNARD VAN ORLEY could claim to have gentle blood in his veins. The family was acknowledged to be noble in Luxembourg and in Brabant. BERNARD's great grandfather married, in the early part of the fifteenth century, a patrician lady of

* See *The Architect*, vol. i.

† *Bernard van Orley*. Par Alphonse Wauters. Paris: Librairie de l'Art.

Brussels, who brought him the fief of Moorsel. They had one son who was a patrician of Sleeuws and, what was probably of more importance, a citizen of Brussels. He was the father of two sons, viz. EVERARD, who succeeded to the family dignity and possessions, and VALENTIN, born in 1466, who appears to have been the elder, but, as he was a "natuerlycke brueder," he was endowed with no more than the family name, and was left to create a new branch of the family. He became a painter, and, if he did not gain immortality, he succeeded in increasing the ranks of Flemish artists. His sons, PHILIPPE, BERNARD, EVERARD and GOMER became painters in their turn, and his daughter married an "ebeniste." In fact, VALENTIN's lineage was linked to Flemish art up to the eighteenth century.

If we compare VAN ORLEY's portrait with that terrible record which TITIAN presented of the appearance of the emperor at a later time, it will not be difficult to understand the extent of the disappointment at the weariness of imperial sway which led to the abdication, the retirement to St. Just and the funeral ceremony which preceded the death of CHARLES by a month. He was unable to bear with the world and died of disgust before he had reached his sixtieth year. The portrait of CHARLES in common with later works suggests one of the qualities of VAN ORLEY. As became a gentleman he was at his ease before grandees, and he represented them as if they were also unflurried. Among his subjects there are no smirking countenances, no attempts at posing, no endeavours to win the admiration or sympathy of the beholder. Without repose there

CHARLES V. *From the portrait by Bernard van Orley.*

BERNARD was destined to win more fame than any of the family, but when he was born is not certain. Various dates between 1470 and 1500 have been given by authorities. M. WAUTERS, who, as archivist of Brussels, should have competence to decide, believes that BERNARD was born between 1490 and 1501.

We suppose the first instructors of BERNARD were his father and his elder brother PHILIPPE. About the early years of the artist there is no information. That he was competent to paint capital portraits when barely out of his teens is evident from his portrait of CHARLES V. That prince was born in the year 1500, and, therefore, if not of the same age, could not be many years the junior of the painter. This portrait of one youth by another is marvellous in characterisation. The young emperor evidently believes in his power, although it is yet untried.

cannot be dignity, and VAN ORLEY's faculty for expressing it secured him the patronage of MARGARET of Austria, who was acting as regent of the Netherlands. It is certain that in 1515 he obtained a commission to paint six portraits of princes and princesses of the Imperial family which were to be presented to the King of Denmark, and the success of his work secured for him similar commissions. In 1518 he was appointed official painter.

He did not confine himself to portraiture in those early days. In 1515 he was selected by one of the confraternities attached to a church in Furnes to paint an altar-piece, which remained in position until 1807. Then it disappeared, and the only part that can be identified is one of the wings, which is in St. Petersburg. Besides painting pictures VAN ORLEY was largely employed in designing for tapestry weaving, which had become a national industry.

He soon became a prosperous gentleman, possessed his own house in Brussels, as well as an unusually large garden, and in order that he might have easy communication between his house and grounds, he was permitted to build a bridge over a stream which separated them.

When ALBERT DÜRER visited Brussels in 1521 he was entertained at a cost of ten florins by VAN ORLEY. The two artists differed in age as in character, and each had his own province in art, but they were among the few who had ventured on a voyage to Italy, and they could compare

sionate appeals from DÜRER. In that city he was suspected to be as little zealous about Catholicity. It was not safe for a philosopher who was not one-sided to remain there, and accordingly ERASMUS departed from Brussels. But his friendship with the VAN ORLEYS compromised the whole family in the eyes of the guardians of orthodoxy. There were other incidents which were likewise made grounds for suspicion. Apparently the artists and their wives were subjected to an investigation, and they may have escaped with a reprimand through the intercession of princess-

BERNARD VAN ORLEY. *From the portrait by Albert Dürer.*

notes about the genius and character of RAPHAEL, who had died in the preceding year. DÜRER must have been favourably impressed with the Flemish painter, for he drew a remarkable portrait of him in charcoal which he afterwards reproduced in oils. By the kindness of M. PAUL LEROI we are enabled to give a copy of it. There can be little doubt that in 1521 BERNARD VAN ORLEY was a young man.

A short time previously another great man, viz. DESIDERIUS ERASMUS, appeared in Brussels, whose apparent lukewarmness about the Reformation had drawn many pas-

regent. But some writers have stated that BERNARD lost his court appointments. If he experienced some of the disfavour of the rulers, he quickly regained it, for in 1531 MARY of Hungary, the successor of MARGARET of Austria, selected him as painter.

Among other commissions from his new patroness was one for a series of designs illustrative of the chase, which were to be executed in tapestry. The drawings are now in the Louvre, and have been reproduced in M. WAUTERS's book. They form an invaluable and unique series illustrative of what was then a royal sport. The designs reveal a

power of representing action and giving animation to scenes which might be supposed to be outside an artist's experience, that could not be inferred from VAN ORLEY's scripture pieces. No less remarkable are several which were intended to glorify the prowess of the imperial troops. In both cases VAN ORLEY appears to have been most careful with costume, and on that account his designs must have been considered as realistic by his contemporaries. Another aid towards producing that impression was his skilful introduction of existing buildings. The backgrounds of some of the hunting-scenes are accepted as authoritative evidence of the appearance of Brussels in the sixteenth century. There can be not the least doubt that VAN ORLEY was an adept in architectural designing. Many of his paintings wherein he introduced imaginative structures are marvels on that account. Some of the Belgian architectural societies would do well to study and treat of that part of his work. Several of the buildings that appear in VAN ORLEY's paintings in the Brussels Museum are not only beautiful in detail, but show so much restraint in keeping fancy in subordination to practicability, that we might suppose them to have been derived from the designs of an architect who was so capable to express the Renaissance spirit as to be considered a visionary, but was feared as one who was sure to bring clients to ruin by his extravagance. VAN ORLEY was the only man who was able to realise the suitability of MANTEGNA's *Triumph of Cæsar* as a subject for the frieze or panels of a building, but nobody in Flanders or elsewhere has had the courage to adopt his suggestion.

Students of art who are desirous to have a most careful analysis of VAN ORLEY's principal works will find it in M. WAUTERS'S book. He has no exaggerated belief in the genius of his subject. His whole endeavour is to secure for VAN ORLEY the position in the history of art which should belong to him if justice is allowed to rule. It is by his works alone the Flemish artist must live. About his life the most patient research by M. WAUTERS can discover little. The few circumstances which have done duty as biographical details in many books will not sustain scrutiny. The date of the painter's death is less uncertain than that of his birth. It occurred on January 6, 1541-42, and the body of the great artist was deposited in the chapel of St. Maur in the church of St. G ry.

PAGAN SEPULCHRAL MOUND, NEAR BRAY, CO. DUBLIN.*

BEFORE touching on the subject of this remarkable "find," it will be well to state how the discovery first came under my notice. The facts are as follows:—One day in August last, while engaged in cataloguing a portion of the antiquities belonging to the Royal Irish Academy, now deposited in our National Museum, Kildare Street, I was waited upon by the Rev. R. Scriven, secretary to his Grace Lord Plunket, Archbishop of Dublin, by whom I was placed in communication with the Hon. B. John Plunket, son of his lordship, who wished me to report on the general features of the discovery. Upon asking how it was that I had the honour of being so selected, the reply came that, "As hon. secretary for South Dublin, Old Connaught was clearly within my diocese."

A few introductory remarks may not be here out of place. It need scarcely be surprising how recent and imperfect is the knowledge we possess of sepulchral and other usages practised in Ireland amongst the archaic tribes by whom this island, as indeed that of Britain, would seem to have been first occupied. Our antiquarian writers of the last century, and, sad to say, of the earlier years of the present, as a rule, were given to indulge in extravagant statements which they boldly published, and in a manner dared their too confiding readers to challenge. A time, however, gradually arrived when, by careful examination of our ancient monuments themselves, much of the obscurity in which their character had been involved became dispelled. The result so far is very promising. The cromleac is no longer held to be a Druids' altar constructed for purposes of human sacrifice; its sepulchral character has been sufficiently and completely vindicated by use of the spade. The stone circle, so long regarded as a Druidical temple, in like manner resolves into the character of a mausoleum. The great Fingollian stone forts of Aran and the west have been assigned to their proper place in the catalogue of Irish monuments of remote antiquity, and have ceased to be looked upon

as sites of early Christian monasticism. The true story of our famous round tower belfries has been ably told, and the wonder now is that their exact character could so long have remained in doubt. Our so-called Danish forts, by which the face of Ireland is mottled, cannot now be looked upon as Scandinavian works—they are Danaan, not Danish. As with the cromleacs and circles, the mystery in which they were shrouded has, in a great measure, been dispelled by agency of spade, shovel and pick. In one branch of archæological investigation, within the last forty years also, vast strides have been made. I would particularly refer to the question of the crannogs or lake dwellings, of which at least 180 have been found in this country, and have been more or less ably described. Materials throwing light on the progress of ancient culture in the British Islands generally, and in Ireland in particular, come to light almost daily. Indeed, as already intimated, much has lately been done, and in essaying to trace back the long line of our ancestry through their handiwork, we are enabled even now in goodly measure to extend our view beyond the horizon of the farthest stretch of hazy tradition.

Most of my hearers are doubtlessly well acquainted with the more common forms of sepulture of early date as found in Erin; that is to say, the cromleac, the stone circle, the cist-bearing mound composed of earth mixed with stones, the chambered cairn, as at Newgrange, Howth, and many other localities; the plain cist, without mound or circle, usually enclosing a sepulchral vessel, and a quantity, more or less, of calcined human bones, often intermixed with those of some of the lower animals, most frequently those of the dog. The stone cists or chambers in which earthen and occasionally stone sepulchral vessels appear, are of various forms and sizes. In general they are simply rectangular, composed of large flags placed on end, and roofed with similar stones generally of considerable size. Be it remarked that along with the vessels and burnt bones entire human skeletons, or portions only, not unfrequently occur; these as a rule show no action of fire. It is not necessary for the purpose of my present communication to describe at any length the varieties and characteristics of ordinary mortuary structures as found in Ireland. I hope this evening to draw the attention of our meeting to a peculiar form of archaic monument which appears hitherto almost entirely to have escaped the notice of Irish antiquaries. I refer to a sepulchral mound situate on the grounds of Old Connaught, near Bray, in the demesne of his Grace the Archbishop of Dublin. As far as I know but one such mausoleum had hitherto been noticed. The exception occurs not far from the village of Blacklion, on the borders of Cavan and Fermanagh.

It has frequently been remarked how fond the primitive inhabitants of Erin were of selecting crowning eminences as sites to form the last resting-place on earth for their dead. On a beautiful slope commanding a grand view of the Dublin and Wicklow Mountains and of the sea stood, and still in part remains, a knob of glacial formation somewhat conical in form, and composed, of course, of yellow clay and water-worn boulders. This natural hillock, which, by-the-by, is environed by a broad ditch, would seem at an extremely early period of society in Ireland to have been used by natives of the locality as an eminence upon which to stretch their dead, over whom they spread a layer of earth varying in thickness from about 4 to 6 or 8 feet. It is only in the darker coloured and artificial portion of the mound that human or other bones and work of man's hands occurred. At least five skeletons lay extended on the glacial clay, and, as far as I could ascertain, no remains of cists were found about them. In the superincumbent earth, artificially raised, occurred an immense quantity of the bones of the old Irish long-nosed pig, of deer, goats, short-horned cattle, and probably of other animals, all of them which had contained marrow being split and open, no doubt the relics of a great funeral feast or feasts.

Much wood charcoal occurred at various elevations, and all over the mound, or rather within its artificial portion.

It must, I believe, for ever rest a doubtful question whether this place of graves was a settled cemetery for a chieftain and his family relations, &c., or whether the interments may not rather point to a scene of violence in which not a few human lives were lost. The preponderance of evidence is this—that the spot had been selected as a *fert* or *tuaim*, i.e. burial-place, by members of some long-forgotten clan or tribe who had their being in the old old age, when bronze was sparingly used, and when stone, bone and shells were still in requisition as materials in the manufacture of weapons and personal appendages, the term ornament, in this connection, being scarcely admissible.

Unfortunately I am at present unable to produce more than one of the human skulls, and portions of one of the skeletons, which, I may state, were unearthed by labourers engaged in raising gravel. These had been secured and secreted by members of his Grace's family. Others may yet be recovered, Mr. Plunket having kindly promised to do all in his power to cause them once more to be brought to light. The specimen on the table is, no doubt, characteristic of a

* A paper read by Mr. W. F. Wakeman at a meeting of the Royal Society of Antiquaries of Ireland.

primitive long-headed race by whom the majority of our pre-historic monuments of earth or stone were constructed. That these people had not made much advancement from an extremely rude condition is clearly indicated by the character of some of their handiwork which accompanied the osseous remains. Many portions of coarsely designed and imperfectly baked earthen vases occurred; these were, doubtlessly, pieces of food-holders which had been used during the celebration of funeral rites. They resemble in every respect fragments of archaic vessels found on the sites of early settlements on the northern coast of Ireland, as at Ballintoy, county Antrim. Several perforated stones and some marine shells prepared for stringing had, in all probability, formed portions of necklaces or of armlets. About one-half of a stone bracelet rewarded a careful search among the *débris*. There were a few roughly-fashioned bone pins and parts of two fibulæ formed of bronze. Some mould-like objects, consisting of baked clay, also appeared. One of these, unfortunately imperfect, was obviously used in casting sword blades, such as we are familiar with in bronze. Another, a small slab, is highly remarkable, exhibiting, as it does, upon one side a groove into which something like an inscription appears to have been scratched while yet the clay was soft. The characters are extremely similar to some described by the late Sir Samuel Ferguson as occurring on the cromlech of Lennore, county Tyrone.

Perhaps some of the most curious of the objects discovered in the mound are a couple of small slabs of stone which exhibit, in miniature, scorings, evidently artificial and executed with intention, exactly analogous to many of the rude rock-markings so common in not a few districts in Ireland, a kind of work which has for years resisted the best efforts of some of our most accomplished antiquaries to decipher or explain.

It is intended that an exhaustive and detailed account of the contents of the mound shall be published, with illustrations. In the meantime antiquaries will be glad to learn that, owing to the watchful care over the diggings (which, by-the-by, are still in progress) exercised by the Plunket family, including his Grace the Archbishop, it is not likely that any object of interest which may occur during future operations will be lost to archæological science.

TESSERÆ.

Horizontal and Perpendicular Effects.

IT is curious how differently we are impressed by expansion in the horizontal and expansion in the perpendicular plane. Take a section of Holland spread out horizontally before the eye, four miles or five in length and one or two in breadth, and it is but a flat, unimpressive plain. But elevate this small, unimpressive parallelogram of land to an angle of 60 deg. with the horizon, and it becomes the most sublime of natural objects; it surpasses Mont Blanc—it is the side of Chimborazo. Set it on edge and it would overwhelm the beholder with its sublimity. It would be the Himalaya Mountains cut down from their dizziest peak to the level of the ocean—a precipice so sublime that the mind would shrink in terror from its very recollection. Now, why does this section of land, which would be but a small portion of the extent of flat plain under the eye, at once from any little elevation, such as a dyke or a church tower in this country, pass from the unimpressive through the beautiful, the grand, to the utmost sublime, by mathematical steps, one may say, and according to its angle of elevation? The only solution of this fact in the sublimity of natural objects is that terror is not, as has been assumed by Burke and our greatest philosophers, the cause of the impression of sublimity in the human mind. Terror must be the effect of the sublime, not its cause, source or principle. In this supposed instance of the sublime in nature, power is evidently the cause of that impression—the intuitive mental perception that great unknown power has been exerted to produce this sublime object. It is the feeling or impression of this vast power which produces that feeling of terror allied with and considered the cause, although in fact only the effect, of the sublime. This impression of power received from any great and rare deviation from the usual makes the perpendicular more sublime than the horizontal, the Gothic cathedral than the Grecian temple, the mountain than the plain, the cataract than the lake, the storm than the calm. Unusual vastness, such as the great extent of flat country seen from any of the church towers in Holland, is also an expression of power and is not without its grandeur; but it never reaches the sublime, because the mind, accustomed to the sight of extension developed horizontally, perceives not the principle of power in it at once. This sentiment of power may possibly have something to do even with our impression of the beautiful in natural objects. The waved line—Hogarth's line of beauty—is agreeable, and the angular, broken or jagged line the contrary, because the one expresses a continuity of power in its formation, the other a disturbance or break in the action of the forming power. The latter would reach the sublime if the disturbance or break were on a great scale, indicating vastness of power.

Fifteenth-Century Furniture.

Wooden furniture of the earlier Mediæval epochs seems to have been very heavy and massive; huge tables of oaken planks fixed and immovable in their places, heavy benches or settles, and large coffer, cupboards and wardrobes ornamented with several ranges of intersecting arcades one above another, with their respective little shafts, bases and capitals, and other architectural members. In the thirteenth and fourteenth centuries, however, architecture is found to completely dominate over furniture; at which period the Gothic or Pointed style became a system as complete and uniform as the ancient Classical developments. The chief members of these latter styles were entirely constructional, massive, great and special to building. In Gothic architecture, on the contrary, the leading features are made up of an aggregate of minor details; an exuberant richness and elaboration of parts veiled the necessary constructional forms, constituting, as it were, a superadded embroidery, which was as pertinent to the simplest article of furniture as to a church; pinnacles, cusps, crockets, tracery, small buttresses, &c., and all the leading decorative motives following, in their developments in furniture, precisely the same modifications and variations in style as the architecture of buildings of the several epochs. In these periods sculpture was the dominant art; consequently, ornamental furniture was generally decorated with elaborate carving, sometimes, however, enriched or picked out with gilding and colour. During this period likewise commences the more extensive employment of rich stuffs, brocades and velvets in the covering of surfaces. Canopies, as appurtenances of state and personal distinction, whether combined with curtains or surmounting chairs, stalls or couches, now also come prominently into use. It is not, however, till the fifteenth century that we can proceed on certain grounds, aided by the study of existing examples. During this period, as the feudal system declined, and the arts of peace became more specially cultivated, an increasing luxury of furniture was everywhere manifested. The architect or the freemason, who, with his workmen, was in earlier times liable to be forcibly impressed by the monarch or his great barons, and required to build alike the castle and to fashion its rude and massive furniture, was henceforth no longer the sole artist. Carvers and cabinet-makers, workers in metal and weavers at their looms, all exercised their trades under the safe protection of their several guilds and companies, and became accustomed to co-operate in the production of elaborate works. Besides the ornate architectural arrangements in wood-carving, the smiths' or locksmiths' work now became conspicuous in articles of furniture, desks, lecterns, &c., in metal being by no means uncommon, whilst the locks, hinges, &c., of wooden furniture were often wrought with the utmost skill and beauty. It is worthy of notice that the metal-work of the Gothic period is chiefly "wrought," the hammer and file working together rather than the chasing tool.

Influence of Italian Architecture.

In the fifteenth century such was the reverence of men for the revived works of ancient literature and science that the profession of the Italians, that they had restored ancient Classical architecture on the precepts of an architect of the Augustan age, was sufficient to open the way for them all over civilised Europe. In the course of that and the following century Italian architecture was adopted and Italian architects employed in France, Spain, Germany, Great Britain and their respective dependencies, and now in the nineteenth century Vitruvius and Palladio are as predominant on the shores of the Baltic as on those of the Mediterranean Sea, though in this country and in some parts of the Continent their influence is considerably diminished since the time of Inigo Jones and Claude Perrault. The Cinquecento was later in gaining a footing here than on the Continent, in consequence of the existence of a beautiful national style of architecture, which our ancestors do not appear to have been induced to resign to the barbarian innovators of the South as readily as the inter-jacent nations were to give up theirs, for which indeed the reason exists in the greater attractions of ours and the consequent greater difficulty of inducing the nation to part with it. The French, though they received the Vitruvian architecture from the Italians, were patriotic enough, as soon as they had acquired its principles, to confine the practice of it almost entirely to native architects, in whose hands it assumed a different character from that which it possessed in Italy and became what may be called the French style of Cinquecento. Its ecclesiastical structures are less faulty than are those of the corresponding period in Italy, but its secular edifices are as far inferior to those of that country. The grand palatial style, which is exemplified in the Farnese Palace in Rome, never found its way into France.

The Thirty-third Annual Exhibition of the Glasgow Institute of Fine Arts will be opened on Monday, the 6th prox., by a conversazione. There will be no private view.

NOTES AND COMMENTS.

A SHARE of the indemnity derived by Germany from France after the war of 1870-71 was set apart for the erection of an Imperial Parliament house in Berlin. It amounted to 24,000,000 marks, and was put out at interest until 1877, when a new arrangement was made. The share had by that time increased to 28,719,964 marks. Up to the present the outlay on the building has been 27,925,000 marks. The Reichstag Palace has, therefore, not needed an appeal for supplementary votes, and this fact suggests the rigorous organisation which extends to civil no less than to military affairs. There is not only a balance of 794,964 marks, which can be utilised for imperial purposes of another kind, but a sum of double the amount is likely to be obtained from the vacant land which was not built over. It has been stated that the building has not gained the approval of the Emperor, but the financial aspects of the undertaking deserve to be recognised as satisfactory.

In the majority of cases if a store full of theatrical scenery caught fire everybody would say such a consummation was to be expected. The Opera House of Paris is, however, a national institution, and the destruction of the scenery on last Saturday night, which will make it impossible to represent "William Tell," "L'Africaine," "The Prophet," "Robert the Devil," "Aida," "Romeo and Juliet," "Hamlet," "Henry VIII.," "The Jewess," "La Favorite," "Don Juan" and other works, about thirty in all, during several months, is a public calamity not only for Parisians but for visitors to the French capital. Yet the citizens should be thankful for the destruction being so limited. A magazine of the kind was a source of danger in the crowded neighbourhood around the Rue Richer, and if the wind had been unfavourable there must have been a large destruction of property. The fire will probably determine a question that has given rise to much discussion. Extensive as is the Opera House it can contain only a limited supply of scenery. According to the regulations, scenery for more than seven operas is not allowed in the building. As the directors considered the quantity was too limited, the public authorities have connived at an infraction of the law, and in consequence scenery for eleven operas has been saved, including the colossal terrace for "Salammbô." It has long been maintained that an adequate building should be erected to store scenery which every year seems to be increasing in area. That would mean an application of the public funds to a purpose which is supposed to be irregular. Much as Frenchmen admire the Opera House they grumble at further taxation to uphold it, and prominent citizens have gone so far as to advocate the demolition of the costly building and the utilisation of the site for commercial purposes. Further time cannot be allowed for playing with the question. Saturday's fire has demonstrated the risks of scenery that was supposed to be unflammable, and the re-establishment of the store in the Rue Richer or in a similar locality would hardly be endured.

THAT foreign contracts can turn out as heavy losses was revealed by a case which was heard in the Edinburgh Court of Session a few days back. In 1886 the Glenfield Company, Limited, Kilmarnock, was informed by a firm of "negotiators of foreign contracts" in Manchester that waterworks were to be constructed at Braila, in Roumania. The company tendered and obtained the contract. The cost exceeded the sum received to the extent of 42,000*l.* It was agreed that a commission of 2½ per cent. on the contract price, or in all 818*l.* 16*s.* 6*d.*, was to be paid to the negotiators, who were to divide the money with their agents or correspondents in Braila. The sum of 659*l.* 8*s.* 3*d.* was paid by the company, leaving a balance unpaid of 159*l.* 8*s.* 3*d.* The negotiators claimed 651*l.* 14*s.* 9*d.* as still due, and brought an action to recover the money. The judge decided that the total commission was to be 818*l.* 16*s.* 6*d.*, for nothing was said in the agreement about paying commission on any extra works. With respect to the balance of 159*l.* 8*s.* 3*d.*, the Glenfield Company stated that it was allowed for by the local agents in a settlement of accounts with the company, and the judge held that all the company need do was to relieve the negotiators from

any liability to their agents for that amount. The Glenfield Company accordingly won the action, and were allowed costs.

THE photographic survey of Warwickshire appears to be producing satisfactory records of old and new objects. During the last year over five hundred plates were added to the collection, which is preserved in the public library, Birmingham. The President stated at the annual meeting on Tuesday that the city was fully appreciative of the work that was being done, but he thought more was expected. He urged them, for their own credit and for the good of the town, to continue the work. From all parts of the country he had received letters asking for advice as to procedure, with a view to other local associations being formed, and he was hopeful that before they met at their next annual meeting a national photographic survey would be established. That would reflect credit on the Birmingham association, and would place it above most other associations in the country. There is no doubt that Birmingham set the example, which deserves to be generally imitated. Hereafter the plates will be invaluable for the archaeologist, topographer and historian. They show what can now be done by co-operation without a large outlay of money.

THE American expedition to the supposed site of Babylon has been sufficiently successful to encourage further efforts. The mounds on the plain of Niffer to the south-east of Babylon, which are supposed to be remains of the city of Nipper, in the building of which, as at Troy, the gods were supposed to assist, were first attacked. Vases, tablets, amulets, stamped bricks, fragments of construction, &c., have rewarded the explorers. An inscription, which relates to SARGON, the oldest Semitic king, is considered to be invaluable. Hitherto his name was only associated with a legend about his deliverance from the waters of a river on which he was floating in a basket. Now he has become a historic personage. Whether he lived 3,750 years before our era remains to be proved. There is much else of archaeological interest which will be announced by the directors of the expedition.

HENCEFORTH *L'Art* is to be produced with pages that will be about one-half the size of those which have become familiar to artists and amateurs throughout the world during nineteen years. The new form is more convenient, especially for subscribers who cannot increase the size of their libraries. It will also enable many improvements to be carried out. The first number of the new series is so attractive in appearance, it is sufficient to persuade the most conservative subscriber that the change in form will be an advantage for him. But an increase of convenience will not be the only consequence. The etchings which have gained so much appreciation are to be forwarded on rollers to subscribers independently of the periodical. The proprietor and editors will therefore be no longer restricted by the size of the pages, and plates on a grand scale will be produced. With the new number an etching from the painting *Maternité*, by Mr. HITCHCOCK, the American artist, which was exhibited at the Royal Academy, and a fine lithograph after M. CAZIN'S *Hagar and Ishmael* are presented. They are worth the sum charged for a whole year's subscription. The contents of the number are varied, and there is an abundance of illustrations. Among the articles is one on DE LEMUD, who was one of the greatest of the French artists in black and white; another on some pastels of DE LA TOUR; and an account of the robbery of The DU BARRY'S diamonds, an affair which was among the minor causes of the French Revolution. There is little doubt they were entrusted to the care of a firm of bankers doing business in Pall Mall, opposite Marlborough House. What became of them is a question which still awaits solution. The favourite made four voyages to London in search of her treasures, which were worth a million and a half livres, or francs, and in consequence was suspected of conspiring against liberty with the English, and was duly guillotined. The number of *L'Art* could not be easily improved, and it promises well for the quality of the new series.

The Architect. Jan. 12th 1894.

The Seat of ALFRED DE ROTHSCHILD, Esq.

ILLUSTRATIONS.

ST. GEORGE.

THE painting which forms the subject of the illustration is supposed to have been executed by RAPHAEL for GUIDOBALDO DE MONTEFELTRO, when the artist visited Urbino about 1504. According to tradition, the back of a draughtboard was used instead of a panel, but there are no traces of such a use to be discovered in connection with the painting. FÉLIBIEN asserts that the *St. George* was painted for HENRY VII. of England. Apparently he confuses it with another picture which bore RAPHAEL'S name in gold letters on the bridle of the horse. That picture was somehow obtained by the Earl of PEMBROKE, who parted with it to CHARLES I. in return for a collection of drawings by HOLBEIN. After the king's execution it was sold for 150*l*. It passed through several hands, and eventually found its way to the Hermitage Gallery, St. Petersburg. The painting we illustrate was purchased by FRANCIS I., and it is now one of the treasures of the Louvre.

CHARLES CLEMENT considers the *St. George* to be the first painting which RAPHAEL completed, to show he was emancipated from PERUGINO'S leading strings. He says that the fire, the vivacity of action, the accuracy of the movements, the beauty of the horse and the rider, the general harmony of the lines, the delicacy of the colouring, the charm of the landscape, the vigour, ease and grace of the composition, were indications of the style the painter was about to adopt, and it is not without emotion we realise in this juvenile but perfect work the beginning of a career that was to be completed in the great works of the Vatican and the *Transfiguration*. RAPHAEL did not possess a creative imagination. In composition he respected precedents, and the *St. George* is supposed to recall the relief by DONATELLO above his statue of *St. George* in Or San Michele, Florence.

GROVE HOUSE, HARROGATE.

THE new salon is 34 feet in length and 22 feet in height, wherein on the right is a stone fireplace rising to the ceiling, consisting of an open hearth, fire-basket and ornamental dogs, over which is a moulded and enriched cornice supported by two caryatids taking the form of mermaids sculptured in Portland stone, from the studio of Mr. FRANK TORY. The frieze is enriched by a representation of a hunting scene, while the whole is surmounted by Elizabethan pilasters and cornice. This apartment is lit by a stained-glass window, 11 feet by 7 feet, in nine panels, with subjects typical of mechanics, science and industry, conceived in a strong key of colour, of bold outline; also by a panelled ceiling-light filled in with rich glass-work from the studio of Messrs. CAMPBELL, SMITH & Co. A carved-oak staircase rises to the first floor, from which level a gallery runs on two sides. The ceiling of the gallery is in enriched plaster-work, the walls have a panelled dado, and the doors are finished with moulded pediments. The whole of this work is carried out in fumed oak, the newels and other portions of the staircase and gallery being richly carved. The drawing-room is 34 feet by 20 feet, having a bay and two other windows to the south, with two fireplaces. This room is finished in dead white with polished mahogany doors, having enriched plaster frieze 2 feet in depth, which also crosses the room at the centre, and is supported by four Corinthian columns. The chintz bedroom has an angle-nook, fitted with settees upholstered in silks. The dressing-rooms are fitted throughout with baths and lavatories with tiled dados, Italian marbles and polished woods. The furniture throughout has been specially designed and made to meet the requirements of each apartment. This work has been executed from the designs and colour schemes of the architect, by Messrs. MARSH, JONES & CRIEBB, of Leeds. The exterior elevations have been carried out in local sandstone, and made to tone in colour with the stone-work of the old house, and designed in harmony with the old work as far as the requirements would allow, the roofs being covered with red tiles. The new kitchen wing has received a somewhat lighter treatment, and half-timber gables have been freely introduced, the roof being again covered with

red tiles. The expenditure in connection with this work has been over 31,000*l*. Mr. T. BUTLER WILSON, of Leeds and Harrogate, is the architect.

HALTON, HERTS.—FOOT OF GRAND STAIRCASE.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair. Owing to the inclement weather the attendance was sparse.

The following gentlemen were elected as members, viz.:—Messrs. R. A. Hinds, C. W. Surrey, F. H. G. Fothergill, W. W. Farthing and W. H. Ward.

Mr. OWEN FLEMING said that in accordance with a notice given at the meeting of the Association on December 8 last, he had intended to propose that evening, "That a special committee be appointed to inquire into the present facilities in London for the training of artisans belonging to the building trades, and to consider and report if, and in what manner, the Architectural Association can exert its influence in the organisation of a complete scheme of education and its future supervision by architects." He found, however, that the committee wished to give the matter more careful consideration, and had requested him to postpone his resolution till the next fortnightly meeting.

The PRESIDENT said the committee were by no means opposed to Mr. Fleming's scheme, but wished for further time so as to make the scheme more workable in its details.

Mr. A. O. COLLARD read the following paper on

The Difficulties of a Young Architect.

Mr. Collard said:—I am not sure at what period an architectural student first considers himself entitled to put the word "architect" after his name, nor does it much matter, as his friends and the public generally succeed in finding out, and learn in time to distinguish very well between his claims and those of such people as the West End sweep, who actually painted the word "architect" on his sooty signboard because of his duties in connection with chimneys.

It is scarcely needful to dwell at any length upon the pupilage stage, except perhaps to remark how few articulated apprentices seem to realise at the time that their future largely depends upon how they employ their time and opportunities when they are young, and that if they waste either it will be terribly hard to make up leeway afterwards. Those are fortunate who, having a natural bias towards artistic things, succeed in entering a good office, and have in other respects congenial surroundings, an able master, and associates willing to impart information. They are less to be pitied, if unsuccessful, than others less fortunately situated, whose commencement may contribute to a similar result through uncongenial surroundings, with small opportunity of receiving that artistic nourishment which is sometimes so lamentably absent. Not that I consider an indifferent office is necessarily bad for a beginner, for at any rate he would probably learn some things very useful in after life, and if he is worth anything at all he will soon find out for himself what is lacking and make up the deficiency. That is the easier nowadays, since we are surrounded with the means of acquiring the groundwork of architectural knowledge, of which the new curriculum of this Association is by some considered the best.

The time wasted by many pupils is fearful, and they, more than their principals, are responsible for it. Pure laziness is the cause of it, I am afraid, though that evil is not, I fancy, so apparent as it used to be.

The life of the improver and the assistant, two stages which some youthful geniuses strive to evade, and in a few cases successfully, though with eventual good to themselves I doubt, are not so bad as many make out. Salaries, it is true, are small, but not more so, I believe, than in most other arts and crafts nowadays, and the opportunities for improvement and gaining experience are many. It is frequently not till a student becomes a wage-earner that he fully discovers his weaknesses, and it is at this period he generally makes great strides in the profession he has adopted. My advice to all pupils on completing their articles is to try very hard to get into a good office, a few of which they will by that time have learned the whereabouts. If they wish to some day practise on their own account—and who do not?—avoid like a penal settlement the chance of an appointment in some public department. The salary may be attractive, but the monotonous routine saps the energies and lessens the once strong desire to fight a way in the world, and gain such measure of success as devotion to his work should bring to a young man. If one can judge from a recent advertisement issued by a public office, the gilded bait is not quite so attractive as it was, for an estimating and measuring clerk is offered 250*l*. a year, while an architectural draughtsman

is to be tempted with 2*l*. a week. A good introduction, a few really good specimens of draughtsmanship and perseverance in spite of rebuffs, will usually gain the entry to a desirable office, such means being perhaps preferable to those used by an assistant in America, who when he was out of work and hard up, walked into an architect's office and successfully demanded employment, his two chief recommendations being a thick stick and a fierce bulldog.

Various reasons may cause a draughtsman to take the plunge into private practice—a desire for emancipation, the offer of a private job, the fact of being out of a berth, having won a competition, or a solid confidence that work will tumble in if only the brass plate is fixed up. Or he may gradually accumulate friends and clients while still working all his time or part with another architect, sharing an office meanwhile with some intimate friend; this latter arrangement giving him frequent chances of talking over knotty questions with someone he is not too shy to consult.

At any rate, having determined to make a start, say, in London, the choice of an address is by no means unimportant. The convenience of clients should be a consideration and first thought, and the effect of even an easily-remembered postal address need not be overlooked, nor the abbreviation if necessary of the too many Christian names or initials with which some thoughtless parents provide their offspring.

Having made a start, however clever an architect may think himself, time, and time only, can bring that ripened experience which enables a man to grasp a subject easily and quickly, and grapple with the difficulties successfully which scare a person of small experience. I would say to all beginners, when in doubt or difficulty which you cannot exactly see through, go at once to an older practitioner, and gain from his ample store of knowledge the information you require. I believe it will be found without exception that our elder brethren cordially render every assistance to those who seek their advice.

To attempt to bluff a client with pretence of knowledge, or Pecksniffian fudge, as it is sometimes called, is little use, so if you don't know, go to some one who can tell you.

Various kinds of architectural work are before you, and those are lucky who can pursue the particular kind which their taste prefers or their skill and education enable them to tackle best. Circumstances or accident may, to the easily led, dictate a particular class of work, but, on the other hand, any one who firmly resolves to strike out in a certain line will, in time, probably gain his desire. Church work, public buildings, theatres and music-halls, schools, houses great and small, in fact, any building with a roof to it, have their attractions and require special study. There are those who find competitions suit their tastes, a form of speculative excitement which may be distinctly objectionable to others, though it would do even the latter no harm to occasionally have a throw at the architectural dice. Success in competitions, however, seems to be to the few specialists, and the steady jog-trot of private practice has sufficient variation for most men. Having in the course of my comparatively brief experience only gone in for one competition, though that was a success, I am not in a position to say anything on the subject generally, and I will leave it to others present to point out the difficulties in connection with this branch of work, and to give some valuable tips in dealing with public committees and boards, the chief, and perhaps the only, point impressed on my mind being the necessity of having an appointment made under seal to insure payment for services rendered.

While clients are few, and jobs far from numerous and remunerative, there is the chance that some older or more fortunate friend may have more to do than he can comfortably manage himself, or in his own office, and may hand some of it over to his needy and thankful brother-T-square, who need have no reason to be ashamed of taking in washing.

Speculative work—that is to say, preparing plans for a building to occupy a certain site, for which building you might also have to find a builder or other person willing to lay out capital—is thankless work, and I believe disagreeable from beginning to end. You may very likely have your work for nothing; or, even if the building is eventually erected from your drawings, you may have little or no control over the builder, who, when he has paid your fees, proceeds to carry out the design as he pleases, and may so distort it that, like Queen Victoria when she once drove past Buckingham Palace, you may inquire, "What building is that?"

The manner of obtaining work seems to rest a good deal with the man who wants it. The possession of private means does not insure it, nor does exceptional brilliancy always do so. To sit in an office and expect work to roll in by some automatic process is to expect too much in these times of keen competition and over-population. As a rule, the young architect has to seek work outside his office by making his wants and abilities known among his friends and relations. The more of these he has the better. To make friends comes naturally to some people. I have heard that teaching in a night-school is labour in this direction not thrown away, though I do

not speak from personal experience. Many forms of sport and pleasure, the social or political club, devotion to one's future welfare, the filling of public offices, the frequent use of the voice and pen in debate and controversy; all these and many other methods are employed with advantage. The press is found by some to gain them the object they desire, namely, notoriety; and even the House of Commons occasionally has a contribution from our ranks. The preparation of pretty pictures for the walls of the Royal Academy gives employment to many of our most skilful draughtsmen, though it is a lamentable fact, the public do not yet seem thoroughly to appreciate the attractions of the architectural chamber. The various building journals give a wide circulation to much work that is good, and when it is so it is warmly welcomed and appreciated. It would perhaps be well if the editorial censorship were more strictly exercised, though, on the whole, young architects might have a new difficulty to contend with if a tribunal or arbitration board had to decide these matters of taste instead of an editor. I would say to young contributors, consult a few intimate friends before you publish designs, for you, of all people, may be the least competent to estimate the quality of your own efforts. I have briefly referred to a few modern ways of obtaining work. Before passing from this branch of our subject, it may be refreshing to remember some architects who have done, or who are still doing, much work and good, without wishing or needing to attract attention beyond the ever-increasing circle of their *clientèle*. The name of one architect, now, alas! dead, suggests itself, who was scarcely known to his fellow-craftsmen, who never published a sketch or drawing, numerous and admirable as they were, breathing the soul of a true artist, but who, nevertheless, enjoyed a very large practice among the best of clients, and lived the most retired life imaginable. Under such conditions, good results seem more possible than in the case of an architect rushing hither and thither, never happy unless immersed in public functions and mentioned in the papers. One point is worth passing reference here, and that is the necessity of not becoming an architect for the mere purpose of earning a living. No more disastrous reason could be chosen, and if that is the sole reason that animates any young architect, he had better by far change his vocation. There are other callings where that object is the only one that need be seriously entertained. You will remember what Professor Garnett said in this room a few weeks ago, when speaking of workmen. That "the man who worked under the pressure of dire necessity to provide the means of nature for himself and those depending upon him, was little better than the slave who worked under the slave-driver's whip. He only was a free man who did his work because he delighted in it; and who did his work as well as he possibly could, because he would have thought it a disgrace to do it in any other way." It would be well if this statement of affairs could be clearly impressed on all who propose to devote their lives to the study and practice of architecture.

The doing of work which by degrees finds its way to a beginner's office is our next consideration. It covers the preparation of drawings, writing specifications, drawing up contracts, interviewing clients and tradesmen, inviting and advising as to tenders, and last, but certainly not least, the carrying out of the approved designs, with the subsequent settlement of accounts. Securing the confidence of a client and enabling him to see that his confidence is well placed depends largely upon a promptitude in grasping his ideas and requirements, and if necessary directing them. A client comes to the architect with more or less acquaintance with his own wants, but as a rule expecting that knowledge to be supplemented by the skilled advice of the expert. He expects to be protected from mistakes of all kinds and to him inconceivable dangers. Too much patience cannot be displayed in pointing out what is undesirable and what impossible. Having come to a full understanding, sketch plans of the proposals can be prepared, a preliminary plan of the site having been made, levels taken, &c.

A thorough knowledge of materials and construction, of the relation of the proposed building to its surroundings and the tastes of the owner, a thorough comprehension of all legal enactments likely to affect the building—and these are sometimes neither few nor very intelligible—site, aspect, drainage and other things are necessary to the young architect to enable him to complete a design which shall be a credit to him as an artist and man of business and give his client satisfaction. If these conditions be fulfilled our youthful genius should, for the time being, be a happy man. This period of the work, if an architect be fond of his pencil and brush, is perhaps the pleasantest, and the many hours constantly spent in sketching, measuring and studying will all add to the enjoyment of his drawing-board. When, after sundry consultations and revisions of his plans, a scheme is finally approved and the word given to proceed, the designer has to put in operation the practical part of his attainments by writing such a specification as will properly describe and explain all that is shown, required and intended by the drawings for the building they represent. To many this is an irksome job

but it should on no account be relegated to other hands; the architect alone has had the advantage of personal consultations with the client and the architect alone knows, or should know, what is wanted, and is responsible for the result. Too much time and attention cannot be devoted to details to insure successful results, and great pains spent thus at the beginning saves endless difficulty, annoyance and very likely additional expense at the end. For instance, drawings should give as much detail and general information as the scale to which they are drawn allows. It is no use making them too pretty or highly finished, for the builder understands or appreciates little of that. What he wants is a clear set of drawings, neatly figured, with the different materials distinctly shown by colour. The same principle applies to specifications which, to my mind, are generally too elaborate and wordy. I think it would be very useful if some talented specification writer were to prepare and publish a few terse, everyday sets of specifications, and thus enable some of us to abandon the antiquated forms we seem to cling to so lovingly. The two trades which beginners stumble over most are, I fancy, the joiner and plumber. A few weeks spent in the shops would soon set this right. Going to another profession for an illustration of the advantage of studying things in detail, we may reflect on Mr. Hart's recent article on the late Sir Andrew Clark, in which he remarks that his illustrious friend "never slurred a point in any case and never passed over a detail which suggested itself to him as being capable of elaboration for the benefit of his patient." With us a client places both himself and his money in our hands and the responsibility is no light one. In doing the work, therefore, that a commission entails, the young architect is morally bound to devote his whole heart, soul and brains to it, not sparing himself.

In carrying out work the beginner may find himself rather at sea. If that be so he had best spend as much time as possible on the job, watching keenly all that goes on, making friends with the workmen, whom he will find as friendly as possible if rightly treated, and willing enough to tell all they know. Do this from the moment the first spit of earth is removed till the last coat of paint is applied. Although it is, perhaps, a little rough on the client, it is a first-rate thing for a young man to act as a clerk of works for a time. He will learn a tremendous lot and never regret it.

As pupil and assistant we are brought to see many difficulties which occur in dealing with builders, tradesmen and clients. But to the young architect these difficulties become far more real, and have a more impressing and depressing effect.

Builders, as a rule, expect to find young architects easy to manage, open to persuasion by emphatic reference to practical experience, and disconcerted by the evasion of some things which they think it safe to omit or too far gone to rectify. Firmness at the commencement of a job will impress such builders as these, and the condemnation of a bad load of bricks will have a wholesome effect. Reflection on any point which seems doubtful will enable the beginner to decide what is right and proper to be done. All builders are not like this, fortunately, but when you come across a really good one, do not lose sight of him. One case occurs to me where a builder having submitted a sample brick for some walling was warned not to use them. He thereupon remarked that at all events they would do for the footings, apparently not wishing to remember that place bricks are as much out of place in foundations as anywhere else, if not more so. So with all materials used in bulk, be careful to see they are up to specification, for more is to be gained by absence of quality there than anywhere.

The quality of materials used is one of the stumbling-blocks in superintending work. To specify the best is one thing; to see you get them is another. Inferior stone, brick and timber, bad joinery and plumbing, paint composed of a non-permanent mixture, mortar and cement bad to start with, and perhaps rendered worse by the weather, cheap foreign glass, with specks and flaws in it, ironmongery below specified prices, all give chances of future trouble. Extras, described as "the builder's aim and the architect's dread," are always on your tracks, and will total up in an alarming way if not firmly suppressed. It seems a wise precaution not to incur any additional cost without a client's consent unless clearly covered by a stated provisional item. Omissions, too, must be carefully noted, in spite of a builder's human nature to consider them fair plunder. Always warn a client when any variation suggested by him is likely to cause extra expense, and never incur the most trifling additional cost without knowing and settling the amount in writing. It is so easy to give a verbal order. But it is a trap for the unwary, as a few months hence will prove, when your memory and the builder's may not precisely agree.

In arranging the terms of a contract, it would be well if a young architect could have proper legal advice, though this is scarcely ever possible. When the Royal Institute of British Architects succeed in producing a well-drawn builder's contract, for which we have waited several years, the young architect may have something reliable to go upon, but till that happy

time arrives he must bestow much time and thought in preparing one which will, as far as possible, protect his client's interests, with fairness to the contractor.

Never forget the peculiar and delicate position you occupy towards both parties to the contract. The architect is at the same time agent and arbitrator, and must remember that fact from the moment the contract is signed.

In arranging the prices of such articles as require special reference in a specification, it is well to see, personally, the various tradesmen and their goods, select what is required and clearly understand and state whether the prices quoted are prime cost or net value, or whether list prices, which signify a profit allowance to builders. It is a little difficult to understand exactly why builders should expect a profit on things which sometimes give them no trouble to obtain, but the insidious practice, like tips, has obtained strong foothold. At any rate, you can see that your client pays no more profit than you choose to allow, and make your intention perfectly clear to both tradesmen and builders. In spite of your care, many builders will strive to obtain a further discount from the manufacturers, but that is the latter's affair, easily settled by an appeal to the architect.

Having the interests of a client at heart, it ought not to be difficult for an architect to secure his confidence and trust, but the difficulty is sometimes to retain them when affairs for the moment go not smoothly. Do not hesitate to differ from him, politely and firmly, if the necessity is obvious and essential, bearing in mind you may be held responsible for any mistakes which may result, even from the adoption of a client's own notions. Give all suggestions the same courteous consideration you expect for your own, and in all domestic arrangements never fail to consult the ladies—for they can be very bitter, afterwards, on points which they know probably more about than yourself, and surely have a right to discuss if they don't. Never quarrel with a client, or if you unfortunately do, don't round on him like the Duke of Buckingham's surveyor did, out of revenge, as described by Queen Katharine in Shakespeare's "Henry VIII." Whatever be your temperament, never show anger or displeasure, and use every endeavour to part good friends, so as to secure a client's lasting esteem for your manners as well as your talents. Architects now stand far better in the public estimation than they used to do, and it should be the constant effort of every young architect to increase that which is more to be prized than title or riches. "Louis XIV., once taking the air in one of his royal gardens, saw Mansard, the architect, walking by. He soon joined the old man, who took off his hat, as was strict etiquette in the presence of his sovereign; but the monarch lifted up his hand in friendly reprehension, and said, 'Pray keep it on, the evening is damp and you may take cold.' The courtiers, who were all standing bare-headed around the king, stared at this extraordinary show of courtesy. But Louis XIV. observed, 'Gentlemen, you are amazed, but learn this: I can make a duke or a marquis with my own breath, but God only can make a Mansard.'" Such honour is given to few of us, but we may all try to deserve it.

Giving estimates is a dangerous business, best avoided if possible. It is very difficult by cubing up a set of drawings, and pricing the result, to be sure of accuracy. Many gentlemen like to know, beforehand, what the probable cost will be, and in giving them an approximate estimate you are not unlikely to be far out of the reckoning. A client who can bear with equanimity the news that the lowest tender has come out much higher than his architect's estimate is a marvel, and on the other hand too high an estimate may prevent the job going out to tender. I have the honour of knowing a gentleman who, by some mental process unknown to me, always forms an estimate of his own, frequently nearer the mark than his architect's.

Always give a client notice of your intention to issue a certificate, in case his money may be temporarily locked up in securities, and he may not wish to realise on a falling market. In issuing certificates be careful to keep a sufficient balance in hand, and before you give a final certificate make sure your client has really got all he is paying for. Unless a job is a very small one, it generally suits a young architect to receive his commission at the same time as the builder gets his cheque, and many clients like this method, for there is a satisfaction in paying as you go.

The scale of charges issued by the Institute for our guidance is a very useful basis on which to rely, and a copy should be given to a new client before a job is begun. The public are satisfied with its fairness, whatever Lord Coleridge may think.

It is well to submit all contract drawings and the specification to a client for examination, and if a quantity surveyor be employed, let him know that too. Also, in arranging the quantity surveyor's charges, see that the stipulated payment covers the settling of accounts, for though clients, as a rule, do not object to pay for quantities being taken out, they fail to see why they should pay any more for accounts being made of the variations, oftentimes a tedious affair and as necessary as the other. Always ascertain who introduces a client, and thank

the friend. Keep out of disputes with adjoining owners and the authorities if you possibly can, and preserve all the arrangements with them in your own hands.

The by-paths of architecture are numerous, and often bring grist to the mill when it is most sorely needed. Our President referred to dilapidations and light and air cases in his opening address. It can do no one harm to be intimately acquainted with such things, so long as the main object is kept in view. Landscape gardening, designing wall-papers, fabrics, carpets and furniture are interesting, and these are subjects which young lady architects especially should be competent to shine in, apart from any other branches they may desire to pursue.

The combination of artistic instinct and business capacity are necessary for the complete architect; perception of what is beautiful and appropriate and what is ugly and out of place; an intuitive understanding and appreciation of form, colour, construction and materials. He must not neglect those more worldly things which entitle him to consideration as a man of business. He must show he appreciates the value of money, and can be trusted to arrange its disposal to the best advantage, artistically and practically. He must keep a diary. Reduce orders and instructions to writing. Keep copies of all documents and drawings. Arrange all papers methodically in pigeon-holes, boxes, cases, drawers and slides, easily accessible. Earn a reputation for punctuality in appointments, and avoid a reputation for exceeding estimates and allowing the accumulation of extras.

A young architect cannot be too well educated, and along with his other studies he should find time to improve his mind in general literature and in those subjects and accomplishments which will make him acceptable in society. He should not neglect the study of man, for all his life he will be dealing with men, and woe betide him if he fails to understand them. It is this study of man which enables engineers, solicitors, doctors and other professional men to gain their own way without causing unnecessary irritation. Leave nothing to chance, and never let questions of time or distance prevent proper attention to work. Do not be bigoted or stick to an opinion when some practical mind points out a mistake. Study your health. Have settled habits. Be at your office regularly. Dress neatly and well. Do not spend too much time at your club, if you belong to one, for the midday lunch is apt to expand into a two hours' lounge, so that when you return to your office the boy may say, "Mr. So-and-So called, and waited half an hour, but cannot call again."

The young architect has uphill work, but his future is mostly in his own hands, and difficulties will melt away if met with determination. So in the words of an ancient but unknown poet—

If at first you don't succeed,
Try, try, try again;
Time will bring you your reward,
Try, try, try again.

The reading of the paper was followed by a discussion, in which Mr. John Hutton, Mr. Thomas Blashill, Mr. Basil Champneys, Mr. Aston Webb, Mr. W. H. Atkins Berry, Mr. Henderson and Mr. Sidney Beale joined. A vote of thanks was passed by acclamation to Mr. Collard for his lecture.

BLICKLING HALL: ITS DRAINAGE, WATER-SUPPLY AND OTHER WORKS.*

ALTHOUGH the comparatively uninteresting subject of drainage may be considered necessarily somewhat commonplace, I venture to think that no apology should be necessary at a meeting of the Royal Institute of British Architects when such a matter is brought forward for consideration. I cannot forget, however, that some enthusiasts prominently associated with our profession have asserted in the plainest possible terms that an architect, if he be strictly an artist, has far too much to think about in evolving the conceptions of his art to trouble himself about drains. This opinion may be traversed without parley, and indeed I venture to assert that no architect, whatever may be his artistic capabilities, can afford to neglect so important a part of his work, however much he may dislike sanitary difficulties and all that belongs to them. Mr. Norman Shaw's admirable dictum, that "a true architect is far more likely to be a practical man than a practical man is likely to be an architect,"† is doubtless true, and few would probably dispute the further self-evident truism that, unless a building be structurally satisfactory and properly drained, its abstract merits as a specimen of fine proportion and beauty of design can but afford a very qualified enjoyment to those whose fate it is to use it. A little care and forethought at the outset of a building undertaking would often enough have saved countless troubles and ultimate expense. Those

who neglect so practical a side of their business go far in practice to justify the existence of a standing army of so-called specialists, whose business it is to make themselves ready to supply the assumed deficiencies of the architect. These things ought not so to be, and surely in this matter of drainage there is, after all, nothing so very difficult, so very special, that the architect should give way to the drain doctor, whose costly contrivances often turn our buildings into veritable museums of building appliances, and disfigure our skylines in every direction. These worthies, on the other hand, have no doubt had the excuse not infrequently ready made to their hand, because architects, in scheming the plans of their buildings, have paid so little regard to the position of water-closets, baths and sinks, which are located here, there and everywhere, thus rendering a really simple system of drainage almost an impossibility.

The less complicated the sanitary arrangements of a building are, of course, the better, and a few well-known rules will go a long way to simplify the planning of drains of even the most intricate buildings. Thousands of existing structures of all kinds will have to be redrained during the next few years, and much of such work will be far better done by qualified architects than by any other class of men. Specially is this the case where the buildings have any just claim to be considered as specimens of architectural merit, while with historic buildings such as the one with which we have to treat to-night, it seems to me of the utmost importance that none but an architect should be allowed to touch the fabric, and even the extent of his work should be rigidly limited to the simple repair and renovation of their perished or perishing parts, while his sanitary work should be carried out in the quickest and most unobtrusive manner possible. Moreover, in dealing with the sanitation of old buildings it is inevitable that much of the work necessary for the efficient execution of the undertaking will partake of the nature of architectural restoration. The condition of the fabric as a whole must be considered, and herein the value of an architect's judgment is of prime importance. Damp walls and unhealthy rooms may arise from a variety of causes not immediately connected with those things with which the drainage-specialist usually concerns himself, and, as a matter of fact, the most elaborate reports from such sources have been prepared dealing with the unsanitary conditions of buildings and in devising costly schemes for their improvement, without even mentioning some of the most evident causes of mischief which a properly qualified architect would point out almost at a glance. While, therefore, I desire to insist upon the unquestionable necessity of thoroughly good drainage, I would urge that the drains after all are only a part, and sometimes really a small part, of what should form a well-considered whole in the efficient work of building, whether we are dealing with a new building or an old one.

Blickling Hall, erected in 1620, is one of the largest and most beautiful mansions in East Anglia. It is situated in a magnificent park, and occupies the site of a palace once belonging to the Bishops of Norwich. Its position, like many another house of its time, is low, and consequently its effective drainage presented difficulties of no small order. These had been increased by alterations in the basement, where its level was lowered some time ago. The moat which surrounds the house has been planted as a garden for very many years, but under the moat itself an old brick culvert extends on all four sides of the building, and this culvert was used as the sewer for all purposes. Its outfall extended for about three-quarters of a mile alongside of the lake, which is about eighteen acres in extent, to its lower end, and there this drain terminates in a copse, through which the overflow of the lake water is carried by way of a stream which continues through the property for miles.

The first portion or upper end of this outfall drain from the culvert round the house had no fall at all, and stood charged with water approximately level with the lower parts of the basement floor. This superabundance of water was principally due to the fact that the culvert passes under the bed of the lake, thus immediately connecting it with the foundations of the hall, while the whole of the roof and surface water collected from the forecourt, stables and adjacent farm buildings, as also from the kitchen wing in front of the mansion, was brought down to the low level of this old brick drain below the moat on its way to the main outfall above described. The culvert, being in itself of faulty construction, was quite unable to withstand such a pressure of water, and in consequence the entire basement was saturated with sewage water, continually causing damp. The supply of flowing water always coming through the drain under the roadway next the kitchen wing from the stream in the fields to feed the lake, had for a long time been needlessly charging the old flat low level sewer, and helping to augment the soakage of the basement already alluded to. Beyond this all the soil from the w.c.'s and sink water had polluted the body of water, while the catch-pits near the house retained a considerable quantity of foul deposit which greatly increased the evil, added to which a stagnant

* Abstract of paper read at the Royal Institute of British Architects, January 8, 1894, by Mr. Maurice B. Adams, F.R.I.B.A.

† *Architecture: a Profession or an Art?* p. 11.

cesspool existed about half-way between the house and the lake. This surcharge of water effectually prevented the bulk of the sewage from reaching the outfall beyond. The basement was so inundated that boards or permanent wood lattice-ways had to be provided in places along the passages to allow the servants to pass over the water. The walls were green with damp, as were the lower steps of the stone staircases, and the woodwork to the windows and skirtings was rotting with wet, producing a state of things most injurious to health. Nothing could very well have been worse under the circumstances, seeing that all the sewage from the stables and kitchen wing was brought from the comparatively high level in front of the mansion down into the basement.

Before briefly describing the new scheme of drainage which I carried out, it may be interesting to mention a curious circumstance connected with the water-clogged condition of this site. An old cesspool was found under the middle of the private drawing-room in a position which at no time since the present mansion has existed could either have been necessary or even convenient—in fact, no use so far as can be seen could have been found for it in such a position. This cesspool therefore must have belonged to the earlier house of Tudor times, for the existing building was erected about 1620. When opened, this cesspool was just as if it had only been in recent use, a state of things which, so far as I know, can only be accounted for by the quantity of water in the land permitting neither the soil to soak out of the cesspit, nor soaking itself into it to dilute the contents, which, by these means were, to all intents and purposes, hermetically sealed, preserved really to develop nineteenth-century nuisances, another evidence of the truth of the well-known saying, "The evil that men do lives after them." I have thus pointed out, I think sufficiently, the main difficulties which presented themselves when I was called upon to solve the problem as to how best to deal with the unsanitary condition of Blickling Hall, and, as a matter of fact, in doing this I really had only a few inches of differences of level in some parts to avail myself of. Permit me now briefly to describe the principal features of the scheme which I carried out.

My first point was to intercept the drainage coming from the two main wings and other buildings in front of the mansion, and so prevent a vast quantity of sewage and surface water from discharging into the lower level round the house at all. This I did by taking an iron drain through the kitchen-staircase hall, and having an ample fall for the purpose I diverted this higher ground drain away from the house in a westerly direction through the park, till it joined the new manhole beyond the sewage sump, which I shall mention presently. Superabundance of water, as you have seen, was the chief cause of the troubles which had to be removed, and I determined to convert its main source into a useful friend, instead of allowing it to remain a serious enemy, as it had undoubtedly hitherto been. I refer to the stream water which came past the kitchens and through the west gardens to feed the lake. This water clearly furnished an available power at once to hand for pumping the low-lying drainage. I therefore cut off the old, rotten and leaking brick culvert, by which this water was conveyed to the lake. I formed a weir of 21-inch glazed ware mastic-jointed pipes, and by carrying it back a considerable way up the roadway course of the stream by the kitchen wing an ample head of water, even in the driest weather, was obtained to work an overshot wheel capable of working two pumps. These were designed and made by Messrs. Easton & Anderson. All the old drains in and about the mansion were taken up, as they proved to be deficient either in fall or in condition, and, moreover, were all difficult of access. All the new drains were laid in straight lengths, and every branch was brought into inspection-pits or manholes, so as to be readily accessible and easily cleared. The manholes were trapped and ventilated, and all the house drains were effectively isolated from the main sewer. The old culvert round the hall was cleaned out and reserved exclusively for rain and surface water, the soil-drains system being kept entirely distinct. The sewage from the house thus collected into one outfall was conveyed to a large sump situated beyond the fosse on the west side of the mansion, and from this tank it is pumped into a 12-inch new pipe drain, which extends from this point about 550 feet in a westerly direction across the park at a higher level, and discharges by its own gradient into the old culvert beyond the point where it passes under the bed of the lake, and from whence it possesses a fall. This is about 800 feet away from the house. At this point I inserted a tidal ball-valve, to prevent any back flow of sewage towards the Hall. The rain and surface water about the house collected in the old culvert under the moat was brought also into the sump, which was estimated to be equal to two days' discharge should both pumps fail at any time.

The stream water waste after passing the wheel flows into the lake, which it supplies as before. The sump is ventilated by a shaft up an adjoining tree, and the pump-house is sufficiently far away from the Hall to prevent the click of the machinery from being heard. An automatic flushing-cistern

fitted with an Adams's patent syphon is fed from the stream weir, and flushes the new main soil-drain periodically, leading to the sump. The difficulty of constructing the sump was considerable, in consequence of the vast quantity of water in the land, and continuous pumping night and day had to be employed. The ground had to be kept up by close sheet-piling, which also served to assist in keeping out the water. An inverted arch of blocks of concrete, made on the spot, formed our foundations, and on this we built up the sump, the big manual pump being placed in the centre. When the time came for removing this pump I had a plug of elm driven into the aperture, a hole sufficiently large to take a small pump being first made in this plug. A small pump was then inserted to relieve the water pressure while the bottom was made good round the larger opening. When this had been done the small pump was drawn out and a timber pin was driven into the hole. The result was most disastrous, for the water burst up the brickwork round about the bigger timber, and all efforts to make it good were unavailing. The water rushed up into the sump as if it rose from a boiling spring, so that the tank was soon full. I went down to Blickling on this occasion with feelings of much misgiving, for it seemed as if the water which I had set myself to master would prove too much for me. However, to sum up, I managed it this way. I stopped the hand-pump and let the water rise to its normal level. I then threw in several bags of Portland cement till the water was saturated with it, and next had some Portland cement concrete let down in buckets and tipped so as to form a raised centre or hill in the centre of the invert bottom over the timber plug. This concrete was rammed carefully so as not to unnecessarily disturb the water, and was thus left to set under water. In ten days or a fortnight we pumped this water out of the sump, and beyond a few tricklings here and there through the joints of the walls of the tank, no water whatever came in, the boiling up from the sump's bottom was stopped, and we became masters of the situation.

Mr. Adams next described the alterations to the outer and inner courts of the mansion, and gave particulars of the rearrangements inside the house, with dry areas and other new work. The whole of the east roofs were renewed, the clock tower restored, and old timber and cement windows along the north part were taken out and replaced with stone. The new fire service system, with the tower which Mr. Adams built in the park, the turbine and the well, bored about a mile from the house, were also enumerated in detail. Several views and plans showing the work as executed were exhibited, together with some photographs.

BOOK AND NEWSPAPER ILLUSTRATION.*

LAST week we saw on the screen a number of enlargements of drawings which had been reproduced successfully by the common relief processes, suitable for the type-press. The most interesting and suggestive to students were those drawn by painters, each adopting his own method of expressing in black-and-white line the effect and spirit of his picture. The result in most cases showed a freedom of handling and an unconventional treatment of line drawing to give tones and values, in striking contrast to the majority of process work. Some of these were only sketches and on various kinds of paper or board, but the artists knew what they wanted to express and took the readiest and simplest method to attain it. They had dwelt for months on their subject, they knew the picture by heart, as the saying is, hence the value to us of their suggestive lines. These drawings (examined with the results when reproduced) form together, I believe, the soundest teaching in black-and-white work.

Drawings thus made upon Bristol board or paper of that surface with black ink, Indian ink, or any of the numerous inks now in use which dries with a dull, not shiny, surface, will always reproduce well. The pen should be of medium point, or a brush may be used as a pen. The lines should be clean and sharp, and are capable of much variation in style and treatment, as we saw in the various examples last week. I purposely do not dwell here upon some special surfaces and papers by which extraordinary effects may be produced sometimes by the line processes; there is too much tendency already with the artist to be interested in the mechanical side.

To turn the drawing before you into a suitable block, the first process is to photograph it to the size required (say 5 by 4) and transfer the negative on to a sensitised zinc plate. This print or photographic image of the drawing lying upon the zinc plate is of greasy substance (bichromate of potash and gelatine), and is afterwards inked up with a roller; the plate is then immersed in a bath of nitric acid and ether, which cuts away what were the white parts on the paper, leaving the lines

* From the Cantor lectures, by Mr. Henry Blackburn, delivered at the Society of Arts in December.

of the drawing in relief. This "biting in," as it is called, requires considerable experience, according to the nature of the drawing. Thus the lines are turned into metal in a few hours, and the plate when mounted on wood to the height of type-letters, is ready to be printed from, if necessary, at the rate of several thousands an hour.

The best drawing for process reproduction is one that requires little or no touching on the part of the engraver or maker of the blocks, but it is difficult to impress on the artistic mind the necessity of conforming to certain rules. Some cannot draw firm clean lines at all, and should not attempt them. Few allow sufficiently for the result of reduction and the necessary thickening of some lines. The results are often a matter of touch and temperament. Some artists are naturally unfitted for line work; the rules which would apply to one are almost useless to another. Again, there is a great inequality in the making of these cheap zinc blocks, however well the drawings may be made; they require more care and experience in developing than is generally supposed.

Let us look now at the enlargement of a line drawing which is more difficult to reproduce; a portrait by the late Frank Holl, R.A. (drawn on Whatman paper, $4\frac{1}{2}$ inches by $3\frac{1}{2}$ inches), in which there are many pale, uncertain and complicated lines which could not be produced well by the process just described. Here a more delicate and sensitive method is necessary to obtain a relief block. It is called the "gelatine process," or the "Gillot process."

The drawing is photographed to the required size (as before), and the negative laid upon a glass plate (previously coated with a mixture of gelatine and bichromate of potash). The part of this thin, sensitive film, exposed to the light, is absorbent, and when immersed in water swells up. The part protected from the light by the lines of the drawing remains near the surface of the glass. Thus you have a negative from which a metal cast can be taken, leaving the lines in relief as in the zinc process. In skilful hands this process admits of more delicate gradations, and the pale, uncertain lines in the drawing before us can be reproduced with tolerable fidelity. The blocks take longer to make, and are double the price—roughly, 1s. per square inch—of the first process described. There is no process yet invented which gives better results from a pen-and-ink drawing for the type-press. These blocks when completed have a copper surface. The reproductions of pencil, chalk or charcoal drawings by the above processes are nearly always failures, as we may see in the best artistic books and magazines to-day. I will refer to them presently.

For those who cannot draw easily with the pen, there are several kinds of grained papers which render drawings suitable for reproduction. The first is a paper with black lines imprinted upon it on a material suitable for scraping out to get lights and strengthening to get solid blacks. The drawings thus made can be reproduced in relief like line drawings, taking care not to reduce the black grain much or it becomes "spotty." Another paper largely used has a white grain, a specimen of which I will show you presently on the screen; and there are other variations of grained papers on which we will not dwell.

Here the question may arise in many minds, Are these contrivances with their mechanical lines for producing effect, worthy of the time and attention which has been bestowed upon them? I think it very doubtful if much work ought to be produced by these means; and certainly in the hands of the unskilled the results would prove disastrous. A painter may use them for sketches.

The increased use of mechanical dots to give shadow and colour to a pure line drawing is always to be regretted, whether it be applied to a necessarily hasty newspaper sketch, or to one of Vierge's handsomely printed illustrations for the "Pablo di Segovia." One cannot condemn too strongly this system, so freely used in continental illustrated sheets, which, in the most skilful hands, seems a degradation of the art of illustration. These dots and lines, used for shadow or tone, are laid upon the plate by the maker of the block, the artist indicating, by a blue pencil mark, the parts of a drawing to be so manipulated; and as the illustrator has not seen the effect on his own line drawing, the results are often a surprise to every one concerned. I wish these ingenious contrivances were more worthy of an artist's attention. Nothing but the speed with which a sketch for a newspaper can be thus made seems to excuse its use. Hurry is the secret and the mischief of it all.

Here is an example taken from an English print, by which you see that all daylight has been taken ruthlessly from an open-air sketch. The system is tempting to the hurried illustrator; he has only to draw in line (or outline, which is worse), and then mark where the tint is to appear, and the dots are laid on the zinc plate by the maker of the blocks.

The question is again uppermost in the mind, Are such mechanical appliances ("dodges," I venture to call them) worthy the serious attention of artists, and can any good arise

in imparting such knowledge to youthful illustrators in technical schools? Wood-engraving was a craft to be learned, with a career for the apprentice. There is no similar career for a lad by learning the "processes" at technical schools, and nothing but disappointment before him if he learns the mechanism before he is an educated and qualified artist.

It should be mentioned that all wood or steel engravings reproduce easily by the common zinc line process, but the reproductions are apt to lose brightness, and if much reduced break up or become spotty. Mention should be made also of drawing on prepared transfer paper with autographic ink, which is transferred to zinc without the aid of photography—a process very useful for rapid and common work; but it is irksome to the artist, and not capable of very good results; moreover, the drawing has often to be minute, as the reproduction has to be the same size as the original.

I now come to the method of reproducing wash drawings and photographs, on blocks suitable for printing at the type-press, commonly known as the "half-tone process," a most ingenious and valuable invention, which in clever hands is capable of artistic results, but which in common use has cast a gloom over our illustrations in books and newspapers.

Now, to make these blocks. As there are no lines or whites in a painting or from a photograph from nature, it is necessary to obtain some kind of grain or interstices of white on the zinc plate, as in a mezzotint. So between the drawing or photographic print to be reproduced and the camera, glass screens, covered with lines or dots, are interposed, varying in strength according to the light and shade required, thus turning the image of the wash drawing practically into "line," with sufficient interstices of white for printing purposes.

Thus, all drawings in wash, chalk, pencil, &c., that will not reproduce by the direct line processes already referred to are treated for printing at the type-press, and thus the uniform, monotonous dulness with which we are all familiar pervades the page.

The artist who draws in wash with body colour, or paints in oils in monochrome, for this process will see at once that his high lights will be lost and his strongest effects neutralised under this effect of gauze; in short, that there is no longer any breadth of white or black in his picture; and so, for pictorial purposes, the illustrator who draws in wash has to force his effect and exaggerate his lights and shades, avoiding too delicate gradation, and in his different tints keeping, so to speak, to one octave instead of two. Thus also for this process, to obtain brightness and cheap effect, the illustrator of to-day often avoids backgrounds altogether.

Some excellent results may be obtained by experienced and practised draughtsmen if their work is well reproduced with a fine grain and printed carefully on good paper. But where the block has to be prepared for printing—say 5,000 an hour off rotary machines—a coarser grain has to be used, producing the "Berlin wool pattern" effect you see before you.

There are many ways by which drawings unsuitable for the relief-toned processes are made available. Great advances have been made in the "screening" of pencil drawings, where a great deal of white has to be left. If, in the endeavour to get the best results out of a few tones by the mechanical process, work lacks some artistic qualities, it is almost a necessity; but the tendency of this most modern form of illustration is to think too much of technique. But with the utmost care and patience on the part of the artist, wash drawings, rendered by the half-tone process, are uncertain and artistically incomplete. It is more suitable for the rendering of sketches. Of the illustrators who use this process in a more free and easy way we will now take an example.

Here truths of light and shade are disregarded, figures stand out in unnatural blackness against white paper, and flat, mechanical shadows are cast upon nothing. Only sheer ability on the part of a few modern illustrators has saved these coarse, ungainly sketches from universal condemnation. But the splashes and spots and stains which are taking the place of more serious work in illustration has become a vogue in 1893. The sketch is made in two or three hours instead of a week; the process is much cheaper than wood-engraving. The public is satisfied with a sketch where formerly a finished illustration was required, if the subject be treated dramatically and in a lively manner. If it comes out an unsightly smear on the page, it answers the purpose of topical illustration, and apparently suits the times. It is scarcely too much to say that this example would not have been tolerated a few years ago. But it is the taste of the times to which the modern illustrator has adapted himself; and it is little short of a revolution in illustration, of which we do not yet see the end. One thing we must continuously bear in mind, that these hastily produced blotches called illustrations, which disfigure the pages of so many books and magazines, are the result of want of care on the part of the artist rather than of the maker of the blocks. The latter are, according to my experience, the most patient and painstaking of operatives.

The result of all this—a very serious one to the artist as far

as we can see ahead—is the gradual substitution of photographs from life for any other form of illustrations.

Now let us see what becomes of a very artistic photograph when put through the half-tone process. Here is the photographic print from a painting by M. Jules Lefebvre. This excellent silver print, full of delicate gradations and strong effects, appears on the plate through the film of gauze, dull, flat and comparatively uninteresting; but the expression of the original is given with more fidelity than could be done by any ordinary wood-engraving. To touch this on the negative and bring out the lights and accents of the picture is the common thing to do by the makers of the blocks; but it is a hazardous process at the best, when dealing with the copy of a painting. I mention it to show where hand-work in the half-tone process first comes in. The block, when made, is also often touched up by an engraver in places, especially where spotty or too dark; on this work many who were formerly wood-engravers now find employment.

But the ideal illustration by process, whether from a line drawing, wash or photograph, it cannot be repeated too often, is the one which requires the least manipulating on the part of the maker of the block, who has seldom or never the opportunity to attend to it properly. In the case of the reproduction of photographs especially, which we are now considering, much may be done by working up a platinotype print before giving it out to be made into a block. Much depends here upon the artistic knowledge of editors and publishers, who have it in their power to produce good or bad illustrations from the same original. The makers of these blocks being confined to time and price are practically powerless.

To turn to other subjects where the photographer is the illustrator. The photographer goes down a mine with his apparatus, and takes a series of views of the workings, which could probably have been done by no other means. Under most difficult circumstances he sets his camera, and by the aid of the magnesium flash-light gives us groups of figures at work amidst gloomy surroundings. Whether these are not both artistic and valuable as illustrations I leave you to judge.

We may observe that it is not the artist and the wood-engraver who are "working hand-in-hand" in the production of the great majority of illustrations, as in America, but the photographer and the maker of process blocks. This is significant. Happily for us there is much that the photographer cannot do pictorially. But the photographer is, as I said, marching on and on, and the line of demarcation between original and photographic illustrations is less marked than formerly.

The photographer's daughter goes to an art school, and her influence is shown clearly in the exhibitions of the photographic societies. This influence and this movement is so strong—and vital to the artist—that I feel it cannot be emphasised too much. The photographer is ever in our midst, correcting our drawing with facts and details which no human eye can see and no one mind can take in at once.

Of the obligations of artists to photographers a book might be written. The benefits are not, as a rule, unacknowledged, nor are the bad influences of photography always noticed. That is to say that, before the days of photography, the artist made himself acquainted with many things necessary to his art, for which he now depends upon the photographic lens; in short, he uses his powers of observation less than he did a few years ago. That the photographer leads him astray sometimes is another matter.

Whatever developments may await the art of photography, says Mr. William Small in 1893, "it will never take good work out of a good artist's hands." In line work (the best and surest for the processes) photography can only be the servant of the artist, not the competitor; and in this direction there is much employment to be looked for. But in whatever material or style, newspaper illustrations, to hold their own, must be of the best. Let them be as slight as you please, if they be original and good. At present we are casting off—ungratefully, it would seem—the experience of the lifetime of the wood engraver, and are setting in its place an art half developed, half studied, full of crudities and discords. The illustrations which succeed in books and newspapers succeed, for the most part, from sheer ability on the part of the artist; they are full of ability, but, as a rule, are bad examples for students to copy. "Time is money" with these brilliant executants; they have no time to study the value of a line nor the requirements of the processes, and so a number of drawings are handed to the photo-engravers—which are often quite unfitted for mechanical reproduction—to be produced literally in a few hours. It is an age of vivacity, daring originality and reckless achievement in illustration. "Take it up, look at it and throw it down," is the order of the day. But there is no reason but laziness why the work done "to look at" should not be as good as the artist can afford to make it. The manufacturer of paperhangings or printed cottons will often print only a limited quantity of one design, no matter how beautiful, and then go on to another. So much the better for the designer; but he would not keep

employment if he did not do his best, no matter whether his work is to last for a day or for a year. The life of a single number of an illustrated newspaper is a week and of an illustrated book about a year.

Another influence on modern illustrations, for good or bad, is the electric light. It enables the photographic operator to be independent of dark and foggy days and to put a search light upon objects which otherwise could not be utilised. So far good. To the illustrator this aid is often a doubtful advantage. The late Charles Keene (with whom I have had many conversations on this subject) predicted a general deterioration in the quality of illustrations from what he called "unnatural and impossible effects," and he made one or two illustrations in *Punch* of figures seen under the then—ten or fifteen years ago—novel conditions of electric street lighting, one of which I will show you on the screen. Charles Keene's predictions have come true; we now see the glare of the magnesium light on many a page, and the unthinking public is dazzled every week in the illustrated sheets with these "unnatural and impossible effects." Thus it has come about that what was looked upon by Charles Keene as garish, exaggerated and untrue in effect, is accepted to-day by the majority of people as a lively and legitimate method of illustration.

I must mention one more influence on the young illustrator. The "process man," the teacher and inciter to achievements by this or that process, is not usually an "artist" in the true sense of the word. He knows better than anyone else what lines he can reproduce, and especially what kind of drawing is best adapted for his own process. He will probably tell the young draughtsman best what materials to use, what amount of reduction his drawings will bear, and other things of a purely technical, not to say business-like character. Let me not be understood to disparage the work of photo-engravers and others engaged on these processes; on the contrary, the amount of patience, industry, activity and anxious care bestowed upon the reproduction of drawings at the present time is astonishing, and deserves our gratitude. Their work in England is a new industry of an important kind, in which art and craft are bound up together. The photo-engravers are our faithful friends and are ready to serve us well, if only the public (represented by editors and publishers) will recognise that good work requires good pay. The day has passed when "process work" is to be looked down upon as only fit for the cheapest, most inferior and inartistic results.

There is no doubt that the makers of process blocks are the best instructors as to the results to be obtained by certain lines and combinations of lines; but in the majority of cases they will tell the artist too much and lead him to take too much interest in the mechanical side of the business. His best protection against this tendency, his whole armour and coat of mail, is to be an artist first and an illustrator afterwards.

This is the sum of the matter. Perhaps some of the examples I have brought here to-night may help us and lead to a more thorough testing of results by capable men.

THE LATE MR. CLARK STANTON, R.S.A.

MANY will hear, the *Scotsman* says, with deep regret of the death of this member of the Royal Scottish Academy, which took place on Monday at his residence, 8 Hermitage Terrace. Of late years Mr. Clark Stanton aged rapidly. His physical powers have been gradually failing. Those who saw him at the recent exhibition of the Scottish Artists' Society were greatly shocked at his altered appearance. He looked seventy, though he was only sixty-two, and in these last days, when confined to bed, life simply ebbed peacefully away. Born in 1832 in Birmingham, Mr. Clark Stanton received his early education at the King Edward Grammar Schools of that city. Art he studied in the Birmingham School of Art. His father, who was in business, wished him to adopt a commercial calling, but Mr. Stanton's tastes being entirely opposed to this course he was allowed to have his own way, all the more as in his youth he was not of robust health. Sketching and modelling were the things in which he delighted; and while still a young man he became associated with the great Elkington firm as a designer and modeller. Many of his figure designs were reproduced by this house in silver and bronze, and he had the honour of designing a silver table which the Prince Consort presented to Her Majesty. So highly was the young artist thought of by the firm that they sent him to Florence to still further continue his studies and to pick up ideas from the wealth of artistic material with which that Italian city abounds. One of his commissions was to model a statue, and this he did, the work called the *Ivy Wreath*—a study of the nude—being exhibited by him in the Royal Scottish Society's exhibition in 1857—the first year his name appears in the R.S.A. catalogue. The statue was described in the *Scotsman* of that day as being modelled in a "masterly and effective" way. When in Florence he became acquainted with

Mr. and Mrs. Gamgee and their family, and came with them to Scotland about 1855 and settled in Edinburgh. In 1861 Miss Gamgee became his wife. In his earlier years in Edinburgh Mr. Stanton did a good deal of designing for such publishers as the Messrs. Nelson, Messrs. Nimmo and Messrs. Ballantyne; and all through life it may be generally mentioned that he did excellent work in designing and modelling cups, groups of animals, and designs for plate for Edinburgh and other silversmiths. It was in 1857, as stated, that he first exhibited at the Royal Scottish Academy. Besides the *Ivy Wreath*, he showed that year a series of medallion portraits, among others of Professor Laycock and Mrs. John Gamgee, which were much admired, as also a fine bust of the late Professor Dick, which, afterwards carved in marble, now adorns the Dick Veterinary College. In the same year he likewise exhibited a series of bas-reliefs illustrating *The Seven Ages of Man*. In 1861 he had in the Scottish Academy a dainty figure in bronze, called *The Young Reveller*, which was a commission from the late Mr. Robert Horn, advocate; and in 1862 he had a bust of Garibaldi, for which he had received sittings from that Italian patriot during the time the artist was in Italy. It is still in the artist's studio. He also showed a statuette of Guinevere in 1862, which was the year he was elected an associate of the Academy. In 1864 he exhibited the cast of the Caledonian Challenge Shield, a trophy which has constituted for the last thirty years the chief prize at the Edinburgh Rifle Meeting. The shield, as all volunteers know, is a spirited and beautiful piece of work, and did the artist much credit.

Among other works by Mr. Clark Stanton may be mentioned the group of three figures, the soldier, sailor and artisan, at the base of the Prince Consort's memorial in Charlotte Square; several of the figures, including Friar Tuck, on the Scott Monument, and part of the relief work on the pedestal of the Duke of Buccleuch's monument in Parliament Square. One of the more important of his sculptured figures shown at the Royal Scottish Academy was his *Pandora*, in 1883, which had also a series of bas-reliefs round the pedestal. In 1885 he exhibited a panel in which, in bas-relief, he gave poetical expression to the line—

When loved ones departed return in our dream.

Mr. Clark Stanton had to wait until 1883 for full membership of the Academy. His was a quiet, sensitive nature, and possibly his retiring disposition had not brought him many friends. But in the meantime it may be feared the high hopes of his more youthful years had gradually slipped away; the sculptor's art has never received great patronage in Scotland, and the golden opportunity for distinguishing himself never exactly arrived. Many of the works he executed did not find purchasers, and what wonder if his courage sometimes failed him, and if to all but his most intimate friends he lived very much apart? But those who knew Mr. Clark Stanton never spoke of him otherwise than as the gentlest and best of men. He had a fine artistic taste, a neat and dexterous hand. He was a skilful modeller, especially in relief, and his work rarely wanted a touch of that graceful decorative feeling conspicuous in Classical art. Possibly its one fault was that it sometimes wanted "grit"—a quality that was also rather lacking, perhaps, in his own composition. In 1881, while an Associate, he was elected Curator of the Life School—an office which involved a good deal of administrative drudgery, which, however, he cheerfully performed. But it had at least one compensation, inasmuch as it brought him into personal and friendly relations with the Academy students, who one and all cherished for him the very highest regard. For a good many years Mr. Clark Stanton exhibited both oil and water-colour pictures, as well as sculpture. Many of his water-colours were exceedingly good—a bit old-fashioned, perhaps, in subject and style, but alike in draughtsmanship and colour works of a pleasing character. Mr. Clark Stanton is survived by a widow and a grown-up family.

Double Windows versus Cold.

SIR,—The thinness of the walls of our houses, as well as most private and public buildings being provided only with single windows, are doubtless among the chief reasons conducing to the freezing up of so many water-pipes and their bursting subsequent to the thaw.

In my Brighton residence, some 120 feet above the level of the sea, which it faces in a south-westerly direction, I find the foreign plan of having double windows has many advantages.

1. In winter, by keeping in the heat of the room and excluding cold, double windows diminish the quantity of coal necessary for heating one's rooms.

2. During fierce storms double windows completely exclude wet and wind.

3. Double windows greatly deaden the noise attending storms, and frequently prevent one's hearing the cries of itinerant hawkers, as well as the belligerent discord of street music.

4. Double windows seem often to enable one to put up with the discomfort of having no convenient means of heating, by open fireplaces, hot air or hot-water pipes, the staircase of one's house, which, of course, in winter ought to be warmer than the living and sleeping rooms.

5. During cold weather on both sides of the panes of single windows ice is often deposited. Hence in a room which is well warmed, when striking against this cold surface the heated air is radiated or reflected back into the room in the shape of a sharp cold draught, which may be injurious to the health of delicate people, especially if seated near the window. However, in the case of double windows, these draughts by radiation are scarcely perceptible, because in a heated room the internal window is warm, particularly if there is a broad air space separating the outer from the inner window.

The back of my house being directly exposed to northerly and north-easterly gales has enabled me often to observe a difference of from 15 deg. to 20 deg. Fahr. between the temperature recorded in the inner side of the external window, as compared with the temperature on the room side of the internal window.

When I first lived in my present residence, during the winter in passing from the front to the back of the house there was frequently a difference of 15 or more degrees Fahr.; so that thus one felt as if one were almost entering another climate.

However, subsequently, being protected by double windows and double skylights throughout the house, as measured from within it, there has been during winter only a very slight difference between its two aspects. Even draining all the cold-water pipes at night time in this house, furnished with a constant water-supply, which has practically no cold-water cisterns (except small ones for the lavatories), nevertheless during sharp frosts some of the cold-water pipes froze up.

I presume this experience proves that even double windows will not prevent the freezing of one's cold-water pipes in houses where the walls are too thin, as is unfortunately too often the case in our modern jerry-built British houses, usually architectural and artistic abominations.

As so many British workmen are now seeking employment, the general introduction of double windows to the backs and fronts of houses would give a large amount of work to many skilled carpenters, glaziers, builders, &c.

The Building and Improvement Act of the future should insert a clause compelling all new houses and buildings to be erected to be provided with double windows, as customary in most foreign countries having cold winters.—I am, sir, yours, &c.

J. LAWRENCE-HAMILTON, M.R.C.S.

30 Sussex Square, Brighton: January 1894.

GENERAL.

Mr. Thomas Drew, R.E.A., was on Tuesday elected president of the Royal Society of Antiquaries of Ireland.

Professor W. Friedrich is now exhibiting in Munich eighty water-colour drawings representing scenes in India which were witnessed during a seven months' tour.

The Spring Exhibition in the Leeds Fine Art Gallery will be opened on February 19. The offers of pictures, owing to the depressed condition of the market, are more numerous than in preceding years. The galleries are about to be repaired.

Professor Forchhammer, the archaeologist, has expired at Kiel. He devoted his life mainly to the elucidation of Classic archaeology. In one of his works he explained the relation between architectural styles and climatic conditions.

Mr. W. Frank Calderon proposes to open a school of animal painting in April next if sufficient pupils are obtainable. Messrs. Briton Riviere, Davis, Gow and Heywood Hardy have promised to visit the classes periodically.

The Council of the Royal Society of Painter-Etchers have elected the following as Associates of the Society:—F. Boberg, G. W. Eve, A. Hartley, Prof. Le Gros, H. Macbeth-Raeburn, H. G. Massey, W. Monk, C. M. Pott, and E. Stamp.

The Rev. E. S. Mylne read a paper on Wednesday, entitled "The Influence of the Mylnes on the Architecture of Edinburgh," at the meeting of the Edinburgh Architectural Association.

Mr. G. D. Leslie, R.A., has designed a handsome altar-table for St. Leonard's Church, Wallingford, of which he is vicar's warden. All the painting has been undertaken by Mr. Leslie.

Mr. J. H. Phillips, of Cardiff, has been successful in the competition for the Llandoverly Girls' Intermediate School. Mr. Ewan Christian was the assessor.

The Architect.

THE WEEK.

CÉSAR DALY who was buried on Sunday was a typical Celt. He was the son of an officer in the English army who was imprisoned under NAPOLEON, and could not, therefore, claim to belong, like the late Marshal MACMAHON and many others, to that Irish Brigade which, since the days of LOUIS XIV., has constituted a sort of nobility in France. In no way was he an aristocrat, but he possessed so many of the qualities of Frenchmen he might be supposed to come of a family that had been established in France from time immemorial. He was endowed especially with that gift of speech which in the days of the Romans was a characteristic of the race, and he was never more happy than when exercising it. A born tribune, whose fitting work should be in the chamber, the law courts, or the pulpit, by one of those freaks of Fate which can mar great gifts he was diverted from his natural course and converted into an architect. He manfully endeavoured to carry out his work and his fervid imagination enabled him to regard the art as a sublime thing. He studied those examples of it in the East and West which were surrounded with mystery. The bourgeoisie, who are the chief patrons of the art, could not appreciate so exalted a way of treating business, and CÉSAR DALY in consequence was not enriched by commissions. Another cause operated against him. His eloquence naturally made him seek opportunities to move his fellows, and he took part in the social experiments of theorists like PÈRE ENFANTIN and FOURIER. Their phalansteries might be excellent institutions, but they never got beyond the paper stage, and association with them was not beneficial to CÉSAR DALY. When the French Revolution of 1848 broke out he thought the good time had dawned. He dreamed of elevating the people by means of art, which was to become inseparable from industrialism. He also endeavoured to obtain for art and literature a special representative in the Assembly, but LOUIS NAPOLEON appeared on the scene, and the artists and poets were the first to hail him as the saviour of France. CÉSAR DALY was obliged to refrain from the exercise of his eloquence on political subjects. He wrote books and established various journals. Everybody was ready to admit that he was a man of genius, who was capable of accomplishing great deeds, but his countrymen preferred to withhold the opportunities from him. He was an able writer, and yet his books and articles never attained the success which was awarded to those by men of inferior ability.

EDINBURGH is visited by so many strangers it is surprising the citizens have not adopted some means to enable the historic houses to be identified. The deficiency is about to be remedied. An anonymous donor has offered 100*l.* to the local Pen and Pencil Club for the purpose of paying for tablets, which are to be affixed to houses where resided the literary men and artists who have helped to make Edinburgh renowned. The Club appointed a sub-committee to consider the subject. They recommend the Club to at once proceed with the work, beginning with the houses associated with BURNS, SCOTT, DAVID HUME, ADAM SMITH and Sir HENRY RAEBURN, as stipulated by the donor. A circular is to be despatched to the proprietors of the houses selected, appealing to their public spirit to grant the facilities required. The Club will offer a prize to be competed for by its members for the best design for a memorial tablet to be produced in bronze or other material for the houses selected. A tablet will therefore be erected in Baxter's Close, on the house in which BURNS resided while seeing his first Edinburgh edition through the press. Another will be affixed to 39 Castle Street, "dear 39," in which so much of SCOTT's most famous work was done, and on 25 George Square, in which he lived with his father during his boyhood and until he married. Tablets will be also placed on the High Street front of the house in Riddle's Close in which HUME began his History, and on the house at the corner of St. David Street and St. Andrew Square, which he built, and in which he died; near the site of Panmure House (North

Back of Canongate), in which ADAM SMITH lived during the years in which he was an Edinburgh citizen; and on the house 32 York Place, which RAEBURN built and used as a studio. With regard to future operations, it is suggested that the names selected should not be of those who were only temporary residents. The men should belong to either of two classes—the one represented by Lord BROUGHAM, who was born in Edinburgh, and whose whole life was affected by the influences he there received as boy and as young man; the other by men like DUGALD STEWART and JOHN WILSON, who, though not born in Edinburgh, lived as active citizens within its walls, and by their lives added to the fame of the "romantic town."

VERY few transactions can take place in Ireland without a contest. The appointment of an architect in connection with a kitchen, laundry, stores, and additional buildings of that class at a lunatic asylum would appear to be a simple affair, but it has given rise to a contest. The asylum, like so much else in Ireland, is doubly governed. There is a Board of Control and a Board of Governors. In 1887, Mr. HAGUE, who is well known in Ireland as an architect for churches and other ecclesiastical buildings, was appointed architect by the latter body. His office would not be over profitable, for the works have still to be undertaken. The Board of Control this week informed the Board of Governors that such appointments were their privilege, and they had selected Mr. J. L. ROBINSON. The latter gentleman is better known to English architects, for he has aided many an excursion by his skill as a photographer, but Mr. HAGUE is no less eligible for the work, and it is to be regretted the two architects should be pitted against one another. Some members of the Board of Governors declared they had been grossly insulted by the action of the Board of Control, but others considered the making of appointments lay with that authority. It is possible there was an overstepping of statutory powers in appointing Mr. HAGUE, but why should it need seven years to discover the error? How long the two bodies will be at loggerheads nobody can tell, and eventually we suppose either Parliament or the law courts will have to settle the difficulty.

EUGÈNE DELACROIX, the French painter, was a sort of misanthrope, who spent his days in a sweating costume in a studio that was heated like a Turkish bath—a way of living that was not advantageous for mind or body. He became more Byronic than BYRON in scorn of the world. If he can condescend to be conscious of affairs in this nether world his spirit ought to be soothed at learning that he was made the subject of a lecture by Lady COLIN CAMPBELL in Glasgow on Tuesday, being the first painter who was distinguished in so aristocratic a manner. Her ladyship said that DELACROIX was a man interesting alike for what he was and for what he represented; a man of impressive individuality and extraordinary concentration and tenacity of purpose, in whom the fires of latent energy were always at work under the mask of a subtle and polished reserve. He was the champion of the romantic movement in painting, sacrificing human affection and every other tie that he might devote himself to the one purpose of his life. So complete was he as an artist, that music and literature came to him with equal ease, and it was more than probable he would have been a great musician if he had not been a great painter. Lady CAMPBELL referred to the painter as a writer on art. In his view imagination was the chief factor in all æsthetic productions, and every work of art should bear the impress of the individuality of the artist. DELACROIX died in the year 1863, and by his instructions he was buried on the top of the hill in Père la Chaise, as if in death he desired the solitude which had marked his life. He was a combination of ice and fire such as the world had seldom seen, and his intense individuality was commemorated in the epitaph from DANTE placed over his grave—"He walked alone in undiscovered paths." A few lectures by English ladies would be not unlikely to exercise a transforming influence on French painters, and the Venus of Milo and Clichy models would be superseded by the engravings in the old "Books of Beauty."

FERGUSON'S "ANCIENT AND MÆDÆVAL ARCHITECTURE."*

IF the selection of an editor for the parts of Mr. FERGUSON'S history which relate to ancient and Mædæval architecture were left to the voting of architects, unquestionably Mr. PHENÉ SPIERS'S name would be found high up on the poll. Few men are to be found among us who have drawn and studied so many examples of buildings, or who are better qualified for giving an impartial judgment on them. As was to be expected, Mr. PHENÉ SPIERS does not turn his editing into a sort of advertising opportunity. While his influence is to be felt throughout, it is only by a troublesome comparison of editions that the extent of his work can be perceived. In his preface, Mr. PHENÉ SPIERS mentions how he "has endeavoured, to the best of his ability, to follow the course which Mr. FERGUSON himself adopted in publishing new editions, viz. to rewrite those portions which subsequent discoveries had proved to be either incorrect or doubtful." Writers, and especially those who treat of the arts, are an irritable race on earth, and their tempers may not be improved in a different part of the universe. But a good many authors in the shades would, we fancy, be ready to envy Mr. FERGUSON (should he grumble) for the pains which have been taken by his publisher to insure a further and longer term of existence for his *History of Architecture*. The five volumes are not only modernised but improved.

It is now so universally known as to need an apology for again mentioning the fact, that Mr. FERGUSON, after the manner introduced by DU FRESNOY, endeavoured to express numerically some of the qualities of the arts. He made three divisions—Technic, Æsthetic and Phonetic. To heating, ventilation, &c., 11 technic points and 1 æsthetic point were assigned. Phonetically that branch of art was valueless. At the other extremity of the scale was eloquence, with 11 phonetic points and 1 æsthetic, the technic value being 0. Architecture was placed about midway in the scale, being unique in having 4 points in each of the three divisions. It does not follow that the worth of buildings is to be taken as uniform; some have technic value in excess, others phonetic. The more perfect Gothic cathedrals have, for instance, 5 technic, 3 æsthetic and 4 phonetic. In the Parthenon there was equality. Mr. FERGUSON observes that "had any exigencies of use or economy controlled the design of the Parthenon, or of any of our Mædæval cathedrals, they must have taken a much lower place on the scale than they now occupy."

It would perhaps be impossible to assess the value of ancient buildings numerically with the impartiality of a Civil Service examiner. In some cases Mr. FERGUSON makes utility his crucial test. Sometimes he judges buildings in a way which shows that he placed picturesqueness or scenic effect above utility. His notice of Antwerp Cathedral may be taken as an instance of the kind, and will serve as well as a hundred. According to his custom, he points out where the architect has failed; or, in other words, explains what JAMES FERGUSON would have done if he lived in the fourteenth century, and were entrusted with the commission for the cathedral without any restrictions. He says:—"If the length of the nave had been divided into ten bays instead of only six, and the central aisle had been at least 10 feet wider, which space could easily have been spared from the outer one, the apparent size of the church would have been greatly increased." Granted. Let us see, however, what the change would have entailed. The outer aisles, which Mr. FERGUSON would so lightly curtail, consist of a continuous series of chapels, for it is there the side altars are arranged. Now, if the outer aisles were made narrower the number of worshippers who assisted at the services in them must be diminished in proportion. On Sundays and holidays those parts of the building often are to be seen in an overcrowded state; at an earlier time it is not likely they were deserted. Was it the duty of the architect to afford inadequate accommodation where it was most needed in order to enhance the appearance of the central aisle? The same cause determined the width of the bays. Only six altars could be placed in each

outer aisle, unless they were so close as to be sources of distraction, and accordingly there are six bays in the other aisles, which became, as it were, so many additions to the chapels. The change to ten bays if practicable would make the altars and side chapels appear insignificant. Is dignity of ritual to be always sacrificed for the sake of sightseers of Mr. FERGUSON'S class? It may be said that use or convenience and effect could easily have been combined if the Fates had imbued the architect with FERGUSONIAN principles. That artist may have been so blessed, nay, he may have been endowed with some of even higher value; but unfortunately in the fourteenth century, as in the nineteenth, compromise was the soul of architecture. The cathedral of Antwerp is an example. Space could not be more carefully economised in a warehouse. The amount of ornamentation evidently depended on circumstances. Parts look gaunt and chilling because there were no citizens to care for the adornment of them. Ecclesiastics wished for a great choir for the display of functions. The stout burghers and guilds would have places where they could show respect for their patron saints, and aisles which allowed of processions in which many men and women could take part. The architect was compelled to accept the conditions, and the wonder is that amidst the conflicts of interests he was able to evolve so much unity.

A modern architect can easily discern the limitations which hampered the designer at Antwerp; but, as the proverb says, bachelors' children are always perfect, and Mr. FERGUSON, having only to deal with buildings on paper, with imaginary clients who could, like Eastern potentates, impart their own unlimited power to their architects, and with conditions which were free from obstacles, naturally assumed that, if they cared, all architects could be omnipotent. The geometrician believes in lines without breadth and surfaces without thickness; in Mr. FERGUSON'S mind architectural practice must have been no less of an abstraction. As he knew little of the financial and other impediments to the creation of masterpieces in Europe, he assumed that architects, ancient and modern, were as free to follow their own fancies as he was when he prepared his fantastic model of an illuminated Parthenon. The East, too, may have made him more of a visionary and enthusiast than was supposed. Absurd as is the confession, we cannot resist saying that, in reading Mr. FERGUSON'S criticisms, especially those relating to modern styles, we have often imagined that he prepared himself for composition, not merely by a comparison of drawings and engravings, but by a course of the "Arabian Nights." Having to keep up a reputation for a man of business, he checks himself from presenting any vision corresponding with the Pavilion of the Caliphat, although many may have floated before him:—

Broad-based flights of marble stairs
Ran up with golden balustrade,
Right to the carved cedarn doors,
Flung inward over spangled floors.
The four-score windows all alight,
As with the quintessence of flame,
A million tapers flaring bright
From twisted silvers look'd to shame
The hollow-vaulted dark, and stream'd
Upon the mooned domes, aloof
In inmost Bagdad, till there seem'd
Hundreds of crescents on the roof
Of night new risen.

But Mr. FERGUSON writes as if he supposed that the genie who created such marvels might still be summoned, and at his command, or by the aid of some instrument, lamp, or other magic gift he is able to lend, perfect temples and palaces will arise like exhalations from the ground.

As would become a man who lived not later than "the golden prime of the good HAROUN AL RASHID," Mr. FERGUSON is not so much smitten with the buildings of Europe as with those of Asia and Africa. In his first volume he tells us with exultation how "Egypt conquered her conquerors and forced them to adopt her customs and her arts." When describing the temple of Philæ he says:—"No Gothic architect in his wildest moments ever played so freely with his lines or dimensions, and none, it must be added, ever produced anything so beautifully picturesque as this. It contains all the play of light and shade, all the variety of Gothic art, with the massiveness and grandeur of the Egyptian style." In another place he goes further, for

* *A History of Architecture in all Countries, from the Earliest Times to the Present Day.* By James Fergusson, D.C.L., F.R.S., &c. Third Edition. Vols. I., II. Edited by R. Phené Spiers, F.S.A. (John Murray.)

he insists that "neither Grecian nor Gothic architects understood more perfectly [than the Egyptian] all the gradations of art and the exact character which should be given to every form and every detail. Whether it was the plain, flat-sided pyramid, the crowded and massive hypostyle hall, the playful pavilion or the luxurious dwelling—in all these the Egyptians understood perfectly both how to make the general design express exactly what was wanted, and to make every detail and all the various materials contribute to the general effect."

The lovers of the East while under the spell of its influence can easily find other places where less reverential awe is necessary to be mingled with their admiration. "From what we know from history of the age of HAROUN AL RASHID," says Mr. FERGUSON, "it is probable that no Moorish Court ever reached a higher pitch of enlightenment and magnificence than that of Bagdad during his reign (A.D. 786-809)." Western work, therefore, has to hide its diminished head when contrasted with some of the Persian buildings in which a faint survival of that magnificence can be traced. He describes the remains of the Mosque at Tabreez (which is supposed to be a thirteenth-century building), having walls covered with glazed and coloured bricks. He says:—"Europe possesses no specimen of any style of ornamentation comparable with this. The painted plaster of the Alhambra is infinitely inferior, and even the mosaic painted-glass of our cathedrals is a very partial and incomplete ornament compared with the brilliancy of a design pervading the whole building and entirely carried out in the same style." The narrow entrance to the Mosque is approached by a vast portal that might have served a purpose similar to the atrium of a basilica. It is used by Mr. FERGUSON to suggest the inferiority of the architects of the Giaour. "The Gothic architects," he writes, "attempted something of this sort by making the outer openings of their doors considerably larger than the inner, in other words, by 'splaying' widely the joints of their portals. By this means, in some of the French cathedrals the appearance of a very large portal is obtained with only the requisite and convenient size of opening; but in this they were far surpassed by the architects of the East, whose lofty and deeply-recessed portals are unrivalled for grandeur and appropriateness." The Mosque at Ispahan is said to "present a scene of gorgeous, though it may be somewhat barbarous, splendour almost unequalled in the whole world." Another Persian building that was erected ages earlier, the Hall of Xerxes at Persepolis, is also set above Egyptian as well as European buildings, for "its size and proportions, combined with the lightness of its architecture and the beauty of its decorations, must have made it one of the most beautiful buildings ever erected."

DE QUINCEY tells us that in the early stage of his malady of opium-eating, the splendours of his dreams were chiefly architectural, and he beheld such pomp of cities and palaces as never appeared before the waking eye unless in the clouds. May we say that Mr. FERGUSON had also his architectural dreams? We must all be subject for life to the power that first awakened any of our faculties, and as the gorgeousness of the East excited within him other desires besides the accumulation of rupees, it is no wonder if his artistic sense was ever longing for satisfaction by means of something that would recall the East. When he told his sister in one of his letters about the difference between the commonplace East India Company's cities, where everyone went on foot and in plain muslin, while at Lucknow "no man with any pretensions to respectability goes out without half a dozen of footmen in gay liveries moving alongside, and as many horsemen with spears and matchlocks prancing before and behind his palanquin," he was revealing the real germ of his Theory of Beauty. "Who does not love," he went on, "to read of the gay pageants of our forefathers, or who does not love to gaze on the poor imitations of them sometimes you get up at coronations or civic feasts?"

A Western artist, poet, litterateur, or any one whose imagination held sway would easily surrender himself to Eastern influences and imagine he was to the manner born. Mr. FERGUSON was too strong in character for that sort of change. He could believe that the Turanians were gifted beyond all other races in appreciation of form, an extraordinary passion for coloured decoration, and an instinctive

knowledge of the harmony of colours. But destiny had made him an Aryan, even a typical Aryan, and the shortcomings of his mind with respect to art were racial attributes which were not to be overcome. Are not many of the characteristics of the spirit which inspired his own criticisms on buildings suggested by what he says about the inherent peculiarities of the Aryans?

Convenience is the first thing which the practical common sense of the Aryan seeks, and then to gain what he desires by the readiest and the easiest means. This done, why should he do more? If, induced by a desire to emulate others, he has to make his building ornamental, he is willing to copy what experience has proved to be successful in former works, willing to spend his money and to submit to some inconvenience; but in his heart he thinks it useless, and he neither will waste his time in thinking on the subject, nor apply those energies of his mind to its elaboration, without which nothing great or good was ever done in Art. In addition to this, the immaterial nature of their faith has always deprived the Aryan races of the principal incentive to architectural magnificence. The Turanian and Celtic races always have the most implicit faith in ceremonial worship and in the necessity of architectural splendour as its most indispensable accompaniment. On the other hand, the more practical Aryan can never be brought to understand that prayer is either more sincere, or is more acceptable, in one form of house than in any other. He does not feel that virtue can be increased or vice exterminated by the number of bricks or stones that may be heaped on one another, or the form in which they may be placed; nor will his conception of the Deity admit of supposing that He can be propitiated by palaces or halls erected in honour of Him, or that a building in the Middle Pointed Gothic is more acceptable than one in the Classic or any other style. This want of faith may be reasonable, but it is faithful to poetry in Art, and, it is feared, will prevent the Aryans from attaining more excellence in architectural art at the present time than they have done in former ages.

"Jeder Schriftsteller schildert sich einigermaßen in seinen Werken, auch wider Willen, selbst," says GOETHE, or, in other words, a book becomes a portrait of its author. In what Mr. FERGUSON says about races, and especially the Turanian and Aryan, we have a self-revelation of capabilities and aspirations. As happens with many other examples of modern literature, we can see why there is a sort of duality in his criticism. Like BRUTUS in the play, he is with himself at war, for sometimes he supposes he is a Turanian, sometimes he is convinced he is an Aryan, and his criticism corresponds with his moods. Does an architect, like the designer of Antwerp Cathedral, arrange his plan to correspond with the requirements of the clergy and laity who employed him, he is judged from a Turanian point of view, and is condemned because he did not make effect paramount. Four centuries ago the church of San Zaccaria was erected in Venice. The architects, in order to allow the congregation in the side aisles to see the high altar, avoided massiveness in their piers, following the precedents of the Italian Mediæval churches. Mr. FERGUSON blames them, because they did not perceive "the artistic value of numerous points of support, nor the importance of superabundant strength in producing architectural effect." The Turanian idea is expressed in these words, but in the very next sentence the Aryan spirit asserts itself, for we are informed that, "notwithstanding the defect, the Cinquecento construction was always truthful, and so far more pleasing than that of the subsequent age, when the most prominent parts of the design were generally added for effect only."

It would be easy to cull numerous instances in which the duality of Mr. FERGUSON's system is seen. Praise is mingled with blame, and a building is admired and condemned in the same sentence. It may be supposed that canons of criticism should be inflexible, but in them, as in morality, more or less elasticity has to be admitted. In our opinion the inconsistency imparts a human, a nineteenth century character, to Mr. FERGUSON's work. He expresses the thoughts of a compound, it may be a discordant, individuality that in a measure corresponds with the nature of the readers. How many architects are there in Britain who would have the courage to make a public profession of devotion to one style alone, or who would print and publish a set of principles as expressions of their faith? The most that can be expected of mortals in these days is to endeavour to be useful, in spite of misgivings about the ultimate utility of being useful. Mr. CARLYLE was acting according to Aryan instincts when he worshipped in the Temple of Immensity. At the same time it is to be hoped for all our sakes that rich men will believe with HAMLET, they must build churches, or else shall they suffer not thinking on. Parish Councils, unlike churches, are an Aryan institution,

for Mr. FERGUSSON tells us that "the village system which the Aryans introduced into India is still the most remarkable of its institutions; these little republican organisations have survived the revolutions of fifty centuries." But if they are to endure for a tithe of that time in England Aryan precedents will have to be departed from, including open-air meetings and comfortable assembly-rooms will have to be erected all over the land. When they are set up and paid for, let them be amenable to criticism according to Mr. FERGUSSON's Turanian and Aryan principles. The contractors at least will not complain.

If pushed to a rigorous conclusion from his own data, Mr. FERGUSSON's books on architecture are not needed. Assume it to be true that "beauty cannot be combined with sense," and that "wherever the Aryans appear art flies before them," is it not then resistance to eternal laws to advocate a combination of art and sense and to retain art from running away? Agriculture, manufactures, commerce, shipbuilding and road-making are the useful arts which Mr. FERGUSSON recognises as being open to Aryans. The late Mr. AYRTON came to a similar conclusion when he bracketed market-gardening with architecture. We know, however, that if destiny cannot be overcome, yet, after a good fight, it is ready, to come to a compromise. If we admit with Mr. FERGUSSON that, "had there been no Pelasgi in Greece there probably would have been no architecture of the Grecian period," we must allow that the Aryan Greeks did somehow continue to cultivate the art in spite of nature and fate. If as much success can be obtained in other barren and unsuitable soils, philosophers and ethnologists need not complain. If the races who are predestined to be architects can produce something infinitely superior, the Cagots of the art in Western lands are always likely to rejoice. At the same time, the sending out of raw Aryans from South Kensington to revolutionise the architecture and other arts of the Turanians is an undoubted insult to destiny, and merits no slight punishment.

THE LATE JOHN CHESSELL BUCKLER.

IN our last number we recorded the death of the Nestor of English architects, Mr. John Chessel Buckler, of Melbury, Cowley St. John, Oxford, which took place on the 5th inst. He completed his century a month earlier, on December 8 last. He was the eldest son of John Buckler, F.S.A., by Ann his wife, daughter of John Chessel, and was born December 8, 1793.

From his father, who at an early age was articled to Mr. Charles Thomas Cracklow, of St. John's, Southwark, architect and surveyor, John Chessel Buckler inherited his taste for the study of architecture, and consummate skill in its delineation, composition and practice. His numerous volumes of original sketches in pencil are an enduring monument of unwearied industry and talent, evincing careful attention to the design, construction, minute expression and elaboration of every detail of Mediæval work. He received lessons from Nicholson, the water-colour artist, and his own drawings, of which many were exhibited in the Royal Academy, have a touch of native genius rarely if ever surpassed. His life was one long devotion to art, from childhood to old age.

The preservation of his excellent eyesight, and the steadiness of his hand, enabled him dexterously to employ the colour brush after he had attained his 91st year upon several interesting subjects, amongst them the gateway of Carisbrooke Castle; the church of Calbourne, in the Isle of Wight, where his father was baptized; and the church of Melbury Bubb. Dorset, built by his kinsman, Walter Bokeler, rector, 1466-1513, by the gift of William Fitzalan, Earl of Arundel, Lord Maltravers, K.G., with the tomb of Alexander Buckler, of Wolcomb Maltravers, his own ancestor, who died in 1568.

Mr. John Chessel Buckler's etchings were masterly, as testified by his quarto volume of the "Cathedrals of England and Wales," published in the year 1822; his dear friend Mr. John Gage's "History of Hengrave," and other works. He wrote an account of Eltham Palace; "Observations on Magdalen College, Oxford;" on the "Restoration of Lincoln Cathedral," and papers in the *Gentleman's Magazine*.

For his design for rebuilding the Houses of Parliament, after the fire of 1834, Mr. J. C. Buckler had the honour to receive the second premium, thankful that he did not obtain the first, in which case he said that "he should have been in his grave long ago."

He delighted in the faithful restoration of churches, mansions, and other ancient buildings, amongst them the cathedrals of Lincoln and Norwich, and Hengrave Hall, Suffolk, in 1820; and Oxburgh Hall, Norfolk, in 1830.

In 1826 was commenced, from the designs of Mr. J. C. Buckler, the magnificent structure of Costessey, near Norwich, the seat of Lord Stafford, of which the grand features, bay windows, moulded brickwork, turrets, clusters of chimneys, chimney-pieces, oak panelling, doorways, doors, and richly carved work are unsurpassed. The designs and moulds made expressly for this work at the Cossey brickyard have been reused till the present time in London and in the country.

The Training College at Chester and the Institution for the Daughters of Clergymen at Warrington were built from his plans in 1836; St. Mary's Church, Dover, in 1843; Butleigh Court, Somerset, and Dunston Hall, Norfolk, in 1850; new churches at Tilney St. Lawrence, Walpole St. Peter and Wilney, Norfolk; the restoration of the chapel, Magdalene College, Cambridge; the restoration of the belfry, spire and pinnacles of St. Mary's Church, Oxford, in 1850; the Choristers' School, Magdalen College, Oxford, in 1849 (the foundation-stone was laid by the Rev. J. M. Routh, president, attended by John Buckler, F.S.A., John Chessel Buckler and Charles A. Buckler); the restoration of the old tower gateways of Oriel College and Brasenose; the restoration of Jesus College and the erection of the new tower gateway; the restoration of the Norman circular west window of Iffley Church, which had been sadly mutilated; last, not least, the mansion of Longridge Towers, Northumberland, for Mr. Hubert Jerningham.

In many of these important and interesting works Mr. John Chessel Buckler was assisted by his eldest surviving son, who was also associated with him in the "Remarks upon Wayside Chapels and the Chantry on Wakefield Bridge" (J. H. Parker, 1843), and the "History of the Architecture of St. Albans Abbey" (Longman & Co., 1847).

On May 12, 1818, John Chessel Buckler was married to Esther, daughter of Captain Thomas Fair, descended from Colonel Robert Phaire, or Faire, of Rostillon and The Grange, in the county of Cork, who went into Ireland in 1649, by Elizabeth his second wife, daughter of Sir Thomas Herbert, of Tintern, co. Monmouth, Bart., the traveller and antiquary, groom of the chamber to King Charles I., whom he faithfully attended during the last two years of His Majesty's life. Mrs. J. C. Buckler died on September 9, 1882, aged 85 years, leaving issue four sons and two daughters.

THE ANTONINE WALL.

THE following letters have passed between the Secretary of the Glasgow Archaeological Society and the Inspector of Ancient Monuments respecting the "feuing" for building purposes of a portion of the line of the Antonine Wall, near Falkirk, and the subsequent erection of a small villa, in which part of one of the best-preserved sections of the Antonine Wall, a relic of the Roman occupation of Britain, has been destroyed:—

Glasgow Archaeological Society, 211 Hope Street,

Glasgow: January 2, 1894.

Lieutenant-General Pitt-Rivers, D.C.L., F.R.S., F.S.A.,
Inspector of Ancient Monuments, Rushmore,
Salisbury.

Sir,—I have been instructed by the Council of the Glasgow Archaeological Society to bring under your notice the destruction of part of an excellently-preserved portion of the Antonine Wall, near Falkirk. The wall at this point runs through the property of Mr. Forbes, of Callendar, who unhappily is not interested in its preservation. He has recently granted a feu for building purposes of a piece of ground near Lock 16, situated on the direct line of the wall, and the consequence has been the erection of a villa with its foundation actually laid across the fosse. This is, of course, very much to be deplored, but it is to be feared that the feuing operations which have thus been commenced may be proceeded with, and that this most admirably-preserved section of the wall may be eventually altogether destroyed. Mr. Forbes is the proprietor of a lengthened stretch of the best-marked part of the wall, and in these circumstances it has appeared to the Council most necessary that an effort should be made to press upon his attention the extreme desirability of his taking steps to preserve so interesting a relic of the Roman occupation and the great and irreparable loss which would be caused by its destruction. I recently addressed a communication to Mr. Forbes on the subject, but I regret to say that he seems indisposed to give effect to any suggestions for the preservation of the wall. At the last meeting of the society a resolution in the subjoined terms was moved by the president, Professor Fergusson, LL.D., seconded by David Murray, LL.D., and unanimously agreed to:—"The society records its extreme regret at the action of the proprietor in feuing for building purposes at Lock 16, near Falkirk, a portion of the Roman wall, on which already a small villa has been erected, with its foundations actually laid across the fosse, at that point admirably preserved." Copies of the resolution were directed to be forwarded to Mr. Forbes, the Society of Antiquaries of London, the Society of

Antiquaries of Scotland, Sir Herbert Maxwell, Bart., M.P., Sir John Lubbock, Bart., M.P., Sir George Trevelyan, Bart., M.P., Secretary of State for Scotland, and yourself. I shall be greatly obliged if you can see your way to give any help to the society in its efforts for the preservation of the wall, or to offer any suggestions as to our future procedure.—I am, &c.,

J. DALRYMPLE DUNCAN, Hon. Sec.

Rushmore, Salisbury: January 4, 1894.

Sir,—In reply to your letter of January 2, 1894, and previous correspondence on the same subject, you will probably remember that when I first drew your attention to this matter in my letter to you of December 26, 1888, Mr. Forbes, of Callendar, was communicated with and he declined to enter into a correspondence on the subject. The Act of Parliament is purely permissive and has no power to compel owners to protect their ancient monuments, or to place them under the Act. The Act is now virtually in abeyance, as the Government are not anxious to increase the number of monuments for which they are responsible, when it is found that owners as a rule take great interest in them and protect them far better than could be done by the State. I retain the post of Government inspector only as an honorary appointment, at the request of the First Commissioner of Works, for the purpose of assisting in any case, such as this, in which a difficulty may arise. This, however, is the only instance that has occurred since the Act was established in 1882, in which an owner has been found unwilling to take any steps for the protection of a monument on his property. Many owners have refused to avail themselves of the Act, but the reason assigned has always been that, taking great interest in the remains, they feel that, living on the spot, they are in a better position to look after them than any Government inspector, in which opinion I entirely concur. This case, however, differs from others inasmuch as the Roman Wall covers a large tract of country, and if it can be shown that the value of the land is capable of being increased by letting any part of it on building leases, the owner is undoubtedly entitled to compensation if any arrangement is come to for the preservation of the works, or if any measure should hereafter be passed for the compulsory sale of the land for this purpose. But when it is considered that this is the only instance throughout the country in which an owner has refused either to preserve a monument himself or to allow it to be preserved by the Government, I think it is evident that the demand for compulsory legislation is very slight, and I do not know how it is to be met in this instance, except by endeavouring to form a strong public opinion of the more educated and intelligent portion of the community in favour of the protection of the earthworks. I think it would be difficult for any landowner to stand against a very pronounced public judgment upon the subject, and this can only be done by local influence. This work is not a mere Scotch monument; it is more even than a national monument. Being the most northerly boundary of the Roman Empire, it is of interest to the whole civilised world, and the nation that allows the last vestiges of such a work to perish will stand badly by the side of others that take a more enlightened view of such matters, and more especially the German Government, which is now spending a large sum upon the exploration and protection of the Limes Romanorum, which bounds the area of the Roman Empire on that side. I will bring the subject of your letter again to the notice of the First Commissioner of Works, but without a change in the Act of Parliament, a change for which, as I have said, there is but little demand, because the present Act during the first years of its operation had the effect of greatly increasing the interest of the public in ancient monuments, and causing them to be better respected by their owners, nothing can be done compulsorily, and persuasively there is but one means in moving the owner, in whose hands it now rests to do as he likes with the earthworks. I would suggest, however, that, as a preliminary to further measures, it might be well to ascertain as far as practicable what the value of the land occupied by the wall on Mr. Forbes's property amounts to. Compensation there must and ought to be. The Act enables Government to acquire land for the preservation of monuments. In a case of such unusual interest, this course might possibly (I speak only in my private capacity as an archaeologist) be entered upon with the consent of the owner.—I am, &c.,

A. PITT-RIVERS, Inspector of Ancient Monuments in Great Britain.

J. Dalrymple Duncan, Esq.

Acting on the suggestion of General Pitt-Rivers, the secretary has asked Mr. Forbes, previous to feuing or otherwise disposing of any further part of the line of the wall, to be good enough to have the value of the ground ascertained, in order that the position of matters may be reported to the Inspector of Ancient Monuments, and brought generally under

the notice of people interested in the preservation of important relics of the past. He has also suggested that, failing any arrangement as to the acquisition of the ground, it might be possible, in granting feus which include any portion of the wall, to insert provisions prohibiting the erection of buildings either on the rampart or the fosse, and making it a real burden on the feu-right that neither of them should be interfered with. It was also pointed out that in the eyes of many people it would add materially to the value of a house that the adjoining garden contained a portion of the Roman Wall.

THE MYLNES IN EDINBURGH.

AT the last meeting of the Edinburgh Architectural Association, a paper by the Rev. Robert Scott Mylne, Great Anwell, Herts (author of "The Master Masons to the Crown of Scotland"), on "The Influence of the Mylnes on the Architecture of Edinburgh," was read. The communication sketched in some detail the connection of the various members of the Mylne family with Scottish architecture generally, and local architectural and kindred work in Edinburgh in particular. It was mentioned that the North Bridge was the last important work executed by the family of Mylne, and it was held that an honourable connection had been maintained for many years between them and the city, and that a distinct impress of their skill was left on many parts of the ancient town. Some of their works had been destroyed by modern improvements or injured by the lapse of time, but others remained as instances of their enduring industry and handiwork. Of the merit or demerit of these the writer was hardly qualified to speak; but he thought that, in reference to Edinburgh and elsewhere, there could be no doubt that the Palace of Holyrood was by far the most important structure connected with the name of Mylne. Dr. R. Rowand Anderson, in moving that the thanks of the Association be conveyed to Mr. Mylne for his paper, alluded to the North Bridge, and said that, in reference to the proposal for rebuilding, it was to be hoped that the claims of architecture would not be kept in the background. If the scheme should be looked upon solely as a piece of engineering to span a certain space, irrespective of everything else, it would be a great misfortune to the city of Edinburgh. If, should it ever be resolved to rebuild the structure, whether in iron or stone, the citizens did not insist on a design worthy of the architectural reputation of the city and of this unequalled site, there would be a blot cast on the town that would remain for generations. Mr. S. Henbest Capper, in seconding, endorsed the views of the last speaker as to the bridge that connects the New and the Old Town of Edinburgh.

TESSERÆ.

Japanese Temples.

THE architecture of the Shin-to temples is derived from the primeval hut, with more or less modification in proportion to the influence of Buddhism in each particular case. Those of the purest style retain the thatched roof; others are covered with the thick shingling called *hiwada-buki*, while others have tiled and even coppered roofs. The projecting ends of the rafters, called *chigi*, have been somewhat lengthened and carved more or less elaborately. At the new temple at Kudanzaka in Yedo they are shown in the proper position, projecting from the inside of the shingling; but in the majority of cases they merely consist of two pieces of wood in the form of the letter X, which rest on the ridge of the roof like a pack-saddle on a horse's back—to make use of a Japanese writer's comparison. The logs which kept the two trees laid on the ridge in their place have taken the form of short cylindrical pieces of timber tapering towards each extremity, which are compared by foreigners to cigars. In Japanese they are called *katsuo-gi*, from their resemblance to the pieces of dried bonito sold under the name of *katsuo-bushi*. The two trees laid along the roof over the thatch are represented by a single beam, called *munaosai*, or "roof-presser." Planking has taken the place of mats, with which the sides of the building were originally closed, and the entrance is closed by a pair of folding doors, turning, not on hinges, but on what are technically called "journals." The primeval hut had no flooring; but we find that the shrine has a wooden floor raised some feet above the ground, which arrangement necessitates a sort of balcony all round and a flight of steps up to the entrance. The transformation in some cases obtained by the addition of a quantity of ornamental metal-work in brass.

Treatment of Gothic Forms.

Buttresses in a pointed composition must not be considered simply as buttresses, or supports to the angles, or sides of a structure, any more than a cornice in horizontal composition may be thought only necessary to cover or protect the wall on

which it rests. That these were the uses for which they were severally applied originally cannot perhaps be doubted; but although they may be useful as such, we must now consider them as aids to architectural effect. Buttresses, then, are of the same use in the vertical style that cornices are in the horizontal—to give character to an elevation by throwing a mass of shadow, to relieve it of the monotony necessarily attendant on a flat surface however it may be pierced or enriched. The sides of the buttresses should be either quite perpendicular the whole height they have to run, or be slightly diminished, if the wall behind them diminishes, in lengths and not by inclined lines. Their faces must run up vertically to the sets-off, and these should be in the same inclined line, and that line pointing to the apex of their pinnacles, when pinnacles surmount them. Indeed it cannot be too strongly enforced that there should be a constant tendency in the outlines of compositions in this style to meet, although the surfaces be themselves so generally perpendicular; and the more acute the angle under which they incline, the more graceful and becoming the style the result will be. The commanding lines of every part of a composition should lead through from its summit to the base. Thus a spire or pinnacle should rest on a tower or turret whose angles are not interrupted, but never on a merely flat wall, however it may be faced with buttresses to give an apparent projection. Neither should low porches be projected from the face of a structure, for such can only have the effect of excrescences and tend to injure a composition; nor should external doors be made but in places where the harmony of the composition is not injured by them as irregular apertures. Internally square forms are seldom used, but piers consist of clustered cylindrical shafts, and thin shafts of the same form, lofty and uninterrupted by crossing lines, act as pilasters. On these, capped with deeply inflected congeries of mouldings or foliage for the former, and lighter ones made continuous and breaking round them for the latter, rest the arches and arched ceilings. Flat surfaces are susceptible of high enrichment by means of tracery and panelling; mouldings are enriched not by carving on them but by rounding out foliage and other ornament in covings and other deep inflections. Corbels should not be substituted for shafts to support arches when it can be avoided; but they have a pleasing effect as supports to the dripstone or canopy of a door or window; and indeed there are many other situations in which they are almost necessary, but they should always be considered as succedaneous, and not as necessary to a composition. To avoid glaring inconsistencies in composing, it will be well to adhere generally to the style of some particular period, and to employ the proportions and enrichments as well as the forms peculiar to it; but, nevertheless, a more ornate may superimpose a plainer part, so that the difference be not violent. Windows of the second period may be placed over an arched composition of the first, and appear naturally to result from it; but the transition would be so great from the first to the third as to make the result inharmonious. It need not, however, be denied to those who feel themselves competent to use the materials with good taste and propriety, to select matter from examples of the various periods, and make compositions not exactly in the style of any of them.

Sand in Mortar.

There are cases in which sand of a peculiar kind, within certain limits, improves mortars; but, as a general rule, the action of sand must be injurious to their strength, and the only valid reason that can be given for its employment is the advantage gained in the first cost of a structure by the saving effected in material. In estimating the probable effect of sand upon mortar, four points present themselves for consideration: the cohesion of the particles of the cementing material; their adhesion to the surfaces of the sand; the increase of strength that may arise when the sand is stronger than the cementing material, from the fracture having to take a longer path than it would where no sand intervenes to break the direct passage in one plane; and the possibility of weak points occurring from several particles of sand remaining in contact without a sufficiency of cementing material to envelop them, and completely fill up their interstices. The latter consideration affects all descriptions of sand—whether granitic, calcareous or argillaceous—pretty equally, and, so far as this cause of weakness exists, the strength of mortar must suffer deterioration. So far as the particles of sand break joint, as it were, and thus lengthen the path of the fracture, something doubtless is gained by its use, especially when the sand is intermixed with gravel and its grains are of various sizes. In respect to the question of adhesion as compared with cohesion, wide differences may be supposed to exist, according to the nature of the surface of the sand, whether rough or smooth, and according as the lime is capable or not of exerting a chemical action upon it. Now, as far as is known, the lime of mortar has no practically appreciable action upon quartz sand; and, therefore, as the greater part of our sand in this country is granitic, the adhesion of the lime to it must be independent of chemical effect; meaning by this term the formation of any

new compound. In France, however, a sand is found, termed an *arène*, which is a description of puzzuolana, and the employment of this sand has a decidedly beneficial action upon lim-mortar. A ferruginous sand, found in the gravel pit close to Prince Frederic's Bastion, on the Chatham Lines, possesses similar qualities, and it is probable that brickdust and burnt clay, as in some instances they form fair substitutes for puzzuolana, would also, in a coarse state resembling sand, have also a beneficial effect both on pure and hydraulic limes, though not perhaps on cements, because these naturally contain all, or nearly all, the clay which the lime can chemically combine with. But with the majority of sands such chemical action is wanting, and the sand and lime particles hold together with the force of adhesion only. Experiments show that with most surfaces this force, as can readily be conceived, is less than that of the cohesion between the particles of lime. The addition of sand, therefore, generally introduces an element of weakness into mortars in this way also. The loss of strength in respect of this will be greater in proportion as the sand is finer, and as the quantity is increased, for by enlarging the extent of surface over which adhesion takes the place of cohesion, not only is something absolutely abstracted from the resistance of the aggregate mortars, by a lesser force being substituted for a greater, but the chance of weak points, from a deficiency of cementing material between the particles of sand, is increased.

Early Christianity and the Arts.

The arts had to suffer from the establishment of Christianity, and we may notice its beginning when, at Ephesus, an uproar arose among the artists because Paul had taught "that there be no gods which are made with hands"; by which the temple of the great goddess Diana was likely to be despised and her magnificence destroyed. The genius of the Grecian artists had been principally displayed in forming the effigies of their deities. What, then, was to be expected from the influence of a system of which the leading tenet was that "there be no gods that are made with hands"? What was apprehended at Ephesus was equally to be expected wherever that system should prevail. The artists would be left without employment, the temples without worshippers and their idols derided or destroyed. Zeal, properly enlightened, would easily have discriminated between the works of men's hands and their abuse. It would have spared the temples which might be adapted to better purposes, and while it ridiculed their worship, would have preserved the statues as monuments of art. The temples, as we know, were often spared, and there is a law of Honorius which prohibited sacrifices but directed the edifices not to be destroyed. At this time it not unfrequently happened that new edifices for Christian worship were constructed from old materials, and the skill of the artist was sometimes manifested in a monstrous junction of bases and capitals. Many ornamental parts were at the same time taken to embellish the palaces of the great. The statues, for which heathenism had expressed a religious veneration, experienced a worse fate. But can we be surprised? Look to the iconoclasm of the eighth century in the East, and to that of our own country in a much later period, when the *Apollo of Belvedere*, or any other exquisite specimen of art, had they been said to represent a Christian saint, would have been dashed to pieces or crumbled into dust by its impetuous fury. Fanaticism never differs from itself. The civilised nations of Europe, and particularly Italy, have expiated the extravagant superstition of their ancestors by the encouragement which they have since given to the arts, and by the veneration with which every fragment has been preserved which time, barbarism and fanaticism had spared. The establishment of Christianity, then, or rather the misguided zeal of its votaries, was adverse to the fine arts. In another sense, the very spirit of that religion was adverse to their encouragement. When the Greeks exhibited the images of their deities the talents of the greatest masters were employed. But the God of the Christians, as being abstracted from matter and infinite in His attributes, could not be brought within the grasp of sense or delineated under any palpable form, however grateful or sublime. To make the attempt was an act of impiety, for it degraded His nature and annulled His essence.

Antiquity of Egypt.

The value of the phenomena of the annual sedimentary deposits of the Nile in Egypt as a test of the lapse of time during which that most recent and still operating geological dynamic has been in progress, was sagaciously discerned by Mr. Leonard Horner. In two memoirs communicated to the Royal Society in 1855 and 1858, the results of ninety-five vertical borings through the alluvium thus formed are recorded. In the excavations near the colossus of Rameses II. at Memphis, there were 9 feet 4 inches of Nile sediment between eight inches below the present surface of the ground and the lowest part of the platform on which the statue had stood. Supposing the platform to have been laid in the middle of the reign of that king—viz. B.C. 1361—such date added to A.D. 1854 gives

3,215 years during which the above sediment was accumulated, or a mean rate of increase of $3\frac{1}{2}$ inches in a century. Below the platform there were 32 feet of the total depth penetrated; but the lowest 2 feet consisted of sand, below which it is possible there may be no true Nile sediment in this locality, thus leaving 30 feet of the latter. If that amount has been deposited at the same rate of $3\frac{1}{2}$ inches in a century, it gives for the lowest part deposited an age of 10,285 years before the middle of the reign of Rameses II., and 13,500 years before A.D. 1854. The Nile sediment at the lowest depth reached is very similar in composition to that of the present day. In the lowest part of the boring of the sediment at the colossal statue in Memphis, at a depth of 39 feet from the surface of the ground, the instrument is reported to have brought up a piece of pottery. This, therefore, Mr. Horner infers to be a record of the existence of man 13,371 years before A.D. 1854: "of man, moreover, in a state of civilisation, so far, at least, as to be able to fashion clay into vessels, and to know how to harden them by the action of a strong heat." Professor Max Müller has opened out a similar vista into the remote past of the history of the human race by the perception and application of analogies in the formation of modern and ancient, of living and dead languages.

Influence of Mediæval Construction.

The combination of masonry and carpentry in building tended greatly to the advancement of both; for, it being required at times to make them act independently of each other, additional science and art were necessary, as the proportions must be retained that were given to similar works in which they co-operated. Hence the wondrous skill evinced in the vaulted roofs and ceilings, in the towers and lofty spires, of some of our Pointed cathedrals for the one, and the splendid piece of construction in the roof of Westminster Hall for the other. To this point Sir William Chambers, who was no depreciator of the merits of the Romans in architecture, says:—"In the constructive part of architecture the ancients do not seem to have been great proficient." Then, having referred many of what he calls the "deformities observable in Grecian buildings" to want of skill in construction, he continues:—"Neither were the Romans much more skilful; the precepts of Vitruvius and Pliny on that subject are imperfect, sometimes erroneous, and the strength or duration of their structures is more owing to the quantity and goodness of their materials than to any great art in putting them together. It is not, therefore, from any of the ancient works that much information can be obtained in that branch of the art. To those usually called Gothic architects we are indebted for the first considerable improvement in construction. There is a lightness in their works, an art and boldness of execution, to which the ancients never arrived, and which the moderns comprehend and imitate with difficulty. England contains many magnificent specimens of this species of architecture, equally admirable for the art with which they are built, the taste and ingenuity with which they are composed." To this Gwilt, in his edition of Sir William's work, adds in a note, "there is more constructive skill shown in Salisbury and others of our cathedrals than in all the works of the ancients put together."

Gainsborough and Reynolds.

Gainsborough, so far from writing, scarcely ever read a book, but for a letter to an intimate friend he had few equals and no superior. It was like his conversation, gay, lively, fluttering round subjects which he just touched, and away to another, expressing his thoughts with so little reserve that his correspondents, considering the letter as a part of their friend, had never the heart to burn it. Sir Joshua's character was most solid, Gainsborough's most lively. Sir Joshua wished to reach the foundation of opinions. The swallow, in her airy course, never skimmed a surface so light as Gainsborough touched all subjects; that bird could not fear drowning more than he dreaded deep disquisitions. In one thing, and in one only, they perfectly agreed—they each possessed a heart full-fraught with the warmest wishes for the advancement of the art they professed, of kindness to their friends, and general benevolence to men of merit, wherever found and however distinguished.

Foundations.

No foundation is more ineligible for a heavy structure than one that is rocky, especially if the rocks are in small masses, or if a sufficient surface is offered of one mass, in strata which dip considerably: in the former case, from the rottenness of the soil in which rocks are generally bedded and which consists for the most part of their detritus; and in the latter, from the liability of stratified rock to crack and slip, against which no precaution is available. Dry gravelly soils, again, are not only loose and infirm, but are exceedingly liable to vacuities of various extent, which are hardly sufficiently provided against by piling: wet gravel is generally more compact and may be better trusted both with and without piles. A deep compacted sand will be found firm if a sufficient surface of it be embraced

by the footings, which should be wider in that than most other cases. In large and deep beds of alluvial deposits the heaviest building may be laid with security, if precautions be attended to for the equal distribution of the pressure throughout. The city of New Orleans, in a delta at the mouth of the Mississippi, rests on a bed of mud, which is held together by a bonding of trunks and arms of trees, but on a broad level bed below. Here the only precaution taken in erecting a structure of the greatest magnitude is to make the trenches for the walls wide and level, and to floor the whole of their surface with thick planks properly bonded: on these the footings are laid, and if any settlement occurs it is of the whole edifice and no injury accrues to any part of it at any time. Clayey and chalky soils are generally understood to form the best natural foundations; in these, under ordinary circumstances, no preparation is required, though for very heavy and unequally pressing works, such as bridges, which are placed on piers made as small as they possibly can be, piling has been considered a necessary precaution. Indeed, except perhaps on an extensive horizontal bed of firm compact rock, no foundation can be considered better than that afforded by piling in a deep clay.

Roman Corinthian.

The less refined taste of the Romans could not appreciate the simple grandeur and dignified beauty of the Doric as it existed in Greece. They appear to have moulded it on what we suppose their own Tuscan to have been, and the result was the mean and characterless ordinance exemplified in the lowest storey of the Theatre of Marcellus at Rome and in the Temple at Cora, between thirty and forty miles south of that city. Not less inferior to the Athenian examples of the Ionic order than the Doric of Cora is to the Doric of Athens are the mean and tasteless deteriorations of them in the Roman temples of Manly Fortune and Concord. It was different, however, with the foliated Corinthian, which became to the Romans what the Doric had been to the Greeks—their national style. But though they borrowed the style, they did not copy the Greek examples of it. In Rome the Corinthian order assumed a new and not less beautiful form and character, and was varied to a wonderful extent, but without losing its original and distinctive features. The example of the Temple of Vesta at Tivoli hardly differs less from that of the Temple of Jupiter Stator in Rome than the latter does from the ordinance of the Choragic monument of Lysicrates at Athens, and all three are among the most beautiful examples of the Corinthian order in existence—if, indeed, they are not pre-eminently so—and yet they do not possess a single proportion in common. It must be confessed, moreover, that if the Romans had not good taste enough to admire the Doric and Ionic models of Greece they had too much to be fond of their own, for they seldom used them. Both at home and abroad, in all their conquests and colonies, wherever they built, they employed the Corinthian order. Corinthian edifices were raised in Iberia and in Gaul, in Istria and in Greece, in Syria and in Egypt, and to the present day Nismes, Pola, Athens, Palmyra and the banks of the Nile alike attest the fondness of the Romans for that peculiar style. The generally received opinion that Greek architects were employed by the Romans after the connection between the two countries took place is not indisputable, for the difference between the Greek and Roman styles of architecture is not merely in the preference given to one over another peculiar mode of columnar arrangement and composition, but a different taste pervades even the details; though the mouldings are the same, they differ more in spirit and character than do those of Greece and Egypt, which certainly would not have been the case if Roman architecture had been the work of Greek architects. Indeed, were it not for historical evidence, which cannot absolutely be refuted, an examination and comparison of the architectural monuments of the two countries would lead an architect to the conclusion that the Corinthian order had its origin in Italy, and that the almost solitary perfect example of it in Greece was the result of an accidental communication with that country modified by Greek taste, or that the foliated style was common to both without either being indebted to the other for it.

Italian Arcading.

The practice of the Italian school in the composition of arcaded ordinances may be generally followed with advantage, except in mingling and confusing them with columnar. The pier is based by a deep square plinth, and surmounted by a square or moulded cap or impost, the upper surface of which is the base line of the arch. In rusticated work the radiating stones of the arch show their joints, and are cut to a uniform appearance with the ordinary surface of the wall. In other cases there is a moulded archivolt, whose width varies from an eighth to a tenth of the opening of the arch. A dropping keystone is generally used, but this very much injures the simplicity, and consequently the beauty, of the arch, and should be avoided. The most graceful average proportion for arcades is, that the opening be twice the width of the pier, and twice its own width in height to the crown of the arch.

NOTES AND COMMENTS

ALTHOUGH the late PAUL BAUDRY died when he was a young man he was accepted as one of the masters of the French school of painting. There is no theatre which contains examples of decoration to surpass those which he executed in the *foyer* of the Opera House, Paris. His subjects were ideal, and the *Cities of Italy*, belonging to the Duchesse de GALLIERA, which were reproduced in *The Architect*, might be taken as representative of the majority of his works. It is no wonder, therefore, that Madame BAUDRY, the widow of the artist, was astonished when she saw her husband's name on the frame of an *Attaque du Village* in the windows of a picture-dealer. The lady protested, but the dealer was able to show her the catalogue of the sale at which it was purchased, with the guarantees of experts. A few days afterwards her son went to the shop, and, without giving his name, bargained for the picture. After agreeing about the price he ordered the picture to be sent to his house. When he obtained possession of it, M. BAUDRY declined to pay the dealer on the ground that the picture was a counterfeit. The dealer at once invoked the aid of the law to obtain the restitution of his property, as well as damages for violence. Madame BAUDRY declared her willingness to return the picture on the condition that her husband's name was effaced. The Tribunal came to the conclusion that it must be left to an expert to decide upon the authenticity of the work, and, in case his opinion was adverse, whether the dealer was justified in exposing the picture for sale. In the meanwhile the picture is to be sent back to the dealer, since it is undoubtedly his property; but he will have to guarantee that he will not endeavour to sell it until the expert has given his decision. The judgment of the Tribunal is equitable, showing a regard for the reputation of a famous artist without being oppressive on the picture-dealer.

LONDON does not appear to be a more advantageous market for the vendors of tapestry than for those who wish to dispose of medals and medallions. The two suites by HORATIO ARCHINTO, after the designs of GIULIO ROMANO, which were sold last week at Christie's Rooms, brought prices which would amaze frequenters of the Hôtel Drouot. The first suite represented scenes from the history of SCIPIO AFRICANUS, and the pieces were sold separately as follows:—"Scipio surrounded by his chiefs entertaining his ally King Masinissa at a banquet," 260 guineas; "Scipio having captured Carthage releases the betrothed of Prince Alluccio," 165 guineas; "Scipio conquers the Spanish princes, Mandonius and Indibilis," 195 guineas; "Meeting of Scipio and Hannibal before the battle of the Zama," 215 guineas; "Triumph of Scipio after his defeat of Hannibal," 205 guineas; "Syphax, Prince of Numidia, taken with other prisoners in triumphal procession to Rome," 200 guineas; "Scipio preparing the sacrifices offered to Jupiter after the capture of Carthage," 185 guineas; "Procession of lictors bearing spoils for sacrifice," 165 guineas. The second suite represented the history of TITUS and VESPASIAN, viz.:—"Titus sacrificing to the gods before the expedition to Judea," 190 guineas; "The Apotheosis of Vespasian," 75*l.* 15*s.*; "Triumph of Vespasian and Titus after the taking of Jerusalem," 240 guineas; "Slaughter of the inhabitants of Jerusalem," 100 guineas; "The assault of the walls of Jerusalem by Titus," 126 guineas; "Titus and Vespasian addressing the army," 95 guineas; "Titus granting the request of the suppliant women," 145 guineas; "Vespasian sparing his enemy," 125 guineas. When it is remembered that the pieces were not only valuable as examples of art, but were in a surprisingly perfect condition, it must be allowed that the purchasers were fortunate in obtaining such bargains.

THE construction of Ardrossan Harbour has of late given much employment to Scottish lawyers. A few days ago Messrs. LUCAS & AIRD claimed a balance of 15,958*l.* 17*s.* 8*d.*, balance of account against the company. The defendants pleaded that the original contract with Messrs. LAWSON & WEMYSS which the plaintiffs carried out was 59,211*l.*, and in addition to that sum the company had paid 84,311*l.* It was admitted that any sums paid for the completion of the harbour could be recovered from the first

contractor, Mr. LAWSON, and his security, Mr. WEMYSS. Eventually Messrs. LUCAS & AIRD agreed to accept a sum which was not announced. A couple of days afterwards the law suits between the company and Messrs. LAWSON & WEMYSS were heard. We have more than once stated the grounds for action. In 1887 the contract was entered into, Mr. WEMYSS, unfortunately for himself, becoming security for Mr. LAWSON. Two years afterwards it had to be arranged that the company should take possession of the whole works under the contract, and employ Messrs. LUCAS & AIRD to execute the incomplete works, paying them interest on the contract price and the net cost of completing the works, with 10 per cent. added for general supervision. The company brought an action against the parties to the contract, and they took another against the company. The dispute was referred to Mr. J. WOLFE BARRY as arbitrator. By his award Messrs. LAWSON & WEMYSS were ordered to pay 111,008*l.*, with interest at 4 per cent. and half the costs of the arbitration. The Harbour Company paid their half of the costs, amounting to 4,541*l.* Mr. WEMYSS appealed against the order on the ground that the proceedings took place in spite of his protests. He also maintained that works outside the contract were admitted. At the last hearing of the case the pleas of Mr. WEMYSS were rejected, and he was ordered to pay 111,008*l.*, interest, &c. The case might almost be called an appalling example of the risks of sureties as well as of the difficulty of dealing with harbour works.

WE trust that the differences between the French Government and the ecclesiastics will not cause the cathedrals and churches to fall into ruin. At present the State grudgingly contributes towards the conservation of the buildings, but as by a recent law inquisition is to be made into the sums, however small, received by the clergy as donations, it would cause no surprise if at any time an announcement were made that the clergy must keep up the buildings without State aid. An indication of that course has been observed in Paris. For about eighty years two houses in the Rue Masillon, which are public property, have been used as a sort of barracks for the *employés* of the cathedral of Notre Dame. The occupation came to an end on the 31st ult. The reason was that the Government surveyors demanded the execution of costly reparation in the two houses, and as the cathedral authorities were unable to expend so much money, the houses had to be surrendered. Their aim was to avoid a collision, and any rights which they might possess from so long an occupancy were sacrificed, although the demand for outlay was not warranted by precedent. Supposing, in connection with Notre Dame, similar demands for renewal and restoration were made, what would the ecclesiastical authorities do? The Government are now possessed of powers by which every sou received must be made known, and, as we have said, it may be decided that the whole or the greater part of the money must be expended on the fabric.

IN the American law courts it would appear to make a great difference in the character of a covered space adjoining a house, according as it is called a porch or a piazza. A case exemplifying this fact has been heard in an equity court in Norristown. The plaintiffs, a land company, sold a lot in Abington, near Philadelphia, to one JOHNSON. The conveyance stated that all buildings erected should be not less than 15 feet from the fence or boundary line. A house was built in which the restriction was respected. Afterwards a porch was added. The company considered a porch was a building, and sought for an injunction against its maintenance. The porch probably was what in England would be called a verandah. The Court held that whether a porch or piazza attached to a dwelling is a building or merely a constituent part of one depends upon the manner of its construction. In the case in question the porch was an open one, and was to be regarded as a building within the meaning of the restriction imposed in the conveyance; objection might be maintained to steps or eaves extending beyond the limit of 15 feet. One of the judges assumed that in whatever sense piazza is used it does not convey the meaning of a building. The injunction was therefore not granted.

HOUSE OF JACQUES CŒUR, BOURGES.

THE first building which visitors to Bourges seek is the mansion erected by JACQUES CŒUR. It is now the local Hôtel de Ville. In spite of changes of fashion in styles that building always finds admirers. FERGUSSON describes it as one of the most extensive as well as one of the best specimens of French Domestic architecture, the best among those which are unfortified. Commenced in 1443, it exemplifies a period when the elasticity of Gothic to meet novel demands was accepted as a matter of course. JACQUES CŒUR was a "royal merchant" in more than one sense, for his relations with CHARLES VII. were not unlike those of GEORGE HERIOT with JAMES I. He was loyal and was proud to manifest that feeling. Accordingly, we find the trefoil or fleur-de-lis is utilised for much of the ornamentation. Very ingeniously the tracery in the upper part of the great window of the chapel is made to take that form, and the fleur-de-lis also crowns the roof. The ownership was expressed by the symbols of the scallop, which was identified with St. JAMES, and a heart, that is JACQUES CŒUR. It is also suggested by the motto, which declares that "To a brave heart nothing is impossible."

The house is evidence of an enormous change which occurred in France as well as England. The town walls and ramparts were utilised either as sites for the dwellings of influential persons or to form part of their premises. JACQUES CŒUR was able to secure not only a length of about 200 feet of the wall at Bourges, but in a part which enabled him to employ three of the towers to form the sub-structure of his mansion. They are to be seen in the front to the Place Berry, which is very interesting, although it is considered to be less picturesque than the principal front. The latter, when complete with a group of sculpture under the canopy, must have been fascinating to visitors to Bourges in the fifteenth century, and it was therefore allowable to suppose that some of the women of the house might well be represented as gazing in return at the strangers in the streets.

The contiguity of the two entrances may appear as a puzzle. The explanation is that JACQUES CŒUR wished to give his neighbours the benefit of his private chapel, and made an arrangement by which it could be approached by a newel staircase leading from the smaller door without entering the house. On entering the large court a pile of buildings three and four storeys in height is seen, having three staircase turrets projecting into the court. The front illustrated is, therefore, lower, as there are only two storeys, one of them being arcaded on the court side. Arcades, cloisters or galleries are on the other sides as well, and were intended to shelter the crowds of poor who were everyday fed by the owner of the house.

Apart from architectural interest the house will always insure attention on account of the remarkable history of JACQUES CŒUR. "Put not your faith in princes" was the declaration of STRAFFORD when he found that CHARLES I. had meanly sacrificed him, and both JACQUES CŒUR and JOAN OF ARC could well employ the words to express the return they received from CHARLES VII. of France for all their services. When the peasant girl was to be sacrificed, that king would not condescend to write a line to save her. JACQUES CŒUR was no less devoted to CHARLES VII., for he placed the fortune he had gained in trade at the king's disposal. CHARLES was in a more impecunious condition than our "Merry Monarch" in his continental retreats, for he was glad to receive two fowls and a loin of mutton for his dinner from the merchant. The "King of Bourges" appeared to be no richer than one of the Kings of Brentford when JACQUES CŒUR became his benefactor and protector. With his aid the royal power became a reality, and in return that power was employed for his destruction. We can only briefly notice the story.

JACQUES CŒUR was evidently one of those sages who were able to realise the greatness of commerce in bringing the utmost variety of things under common principles. Unlike most men of that time there was nothing parochial about him. He was as familiar with the East as with Europe. He not only was acquainted with the products of the age, but he realised that the world produced things which could be turned to use with the aid of real know-

ledge. Accordingly, JACQUES CŒUR became the friend and supporter of such followers of science as were then to be met with. The ignorant people of the fifteenth century naturally concluded that he kept alchemists to make him gold, and to prepare poisons whenever it was necessary to get rid of an obstacle to the increase of his wealth.

The death of AGNES SOREL, the king's favourite, was seized as an opportunity for the destruction of a man to whom all the courtiers, as well as the king, were indebted. JACQUES CŒUR was her friend and executor; therefore he poisoned her. The charge depended on a ridiculous conclusion of that sort, and was not followed out; but it was sufficient to warrant the seizure of the merchant prince. Once an innocent man found his way into a French prison there was little difficulty in retaining him. In the case of JACQUES CŒUR it is sufficient to say that "bishops, marshals, knights, chamberlains, secretaries and others of the king's household, down to the servants and lowest attendants, even to house-painters and washerwomen," were among his numerous debtors, and what better way could they devise to gain that little time which is so much desired by all who owe money than by keeping him secure in a dungeon? One charge after another was fabricated. After going through a course of investigation in Taillebourg, the accused was sent to Lusignan, then to Maille, and next to Tours for a repetition of the process. Secular and ecclesiastical authorities disputed for his possession. In those days little could be done without written orders; in fact, life resembled "extras" in a modern building contract. Where were the signed documents without which many of JACQUES CŒUR's actions were treasonable? Says the historian:—"It was necessary to seek in the different towns of Languedoc the orders given by the king for the levy of supplies; receipts, which justified their employment; letters, by which a part of the money was named as destined for his own use; in fine, permissions which he had obtained from the Popes EUGENIUS and NICOLAS V. for the transport of arms to the Saracens. If these permissions were not to be found at Montpellier or at Aiguesmortes, it would be necessary to seek them in the registers at Rome. They were, in fact, not found; good care had, no doubt, been taken that they should not be forthcoming; yet that they existed there could be no question, for copies were afterwards obtained with certificates which prove their authenticity."

It is evident from the procedure that the "law's delay" was as familiar a principle in French castles and dungeons as in the English Chancery. JACQUES CŒUR, like many a brave man in subsequent ages, grew desperate under it. We suppose he belonged to a guild or confraternity, probably was a high officer in one. The Church may also have shown its respect for him by conferring on him "minor orders." On the strength of some privilege he repudiated his judges and claimed as an ecclesiastic to be tried by ecclesiastics. The first effect of his protest was to make his possessors prove their power by subjecting JACQUES CŒUR to the torture. Afterwards he was condemned to death. He was not executed—for there would be no increase of profit obtained in that way. The end that was sought from the beginning was secured by granting him the grace to live in order that he could repent, and by confiscating all his property. His judges and the other agents engaged in conducting the process were allowed to share in the division of the booty. The king, of course, derived most benefit from the transaction.

At such a time it appears almost incredible that one courageous friend could be found who was faithful to JACQUES CŒUR. Like FLAVIUS in "Timon of Athens," his steward JEAN DE VILLAGE was unchanging in his love, duty and zeal. By his efforts JACQUES was allowed to depart from his dungeon, and after a time master and steward made their way to Rome. The reputation of JACQUES CŒUR was not unknown in the Papal Court, and he was soon allowed the opportunities to regain the chief control over the commerce of the world. The value placed on his organising power is evident from his appointment as commander of an expedition against the Turks. He was unable to gain laurels, for he was overcome by the fatigues, and died on reaching Chios. JACQUES CŒUR was in his sixty-first year. CHARLES VII. died about the same time, and his successor LOUIS XI. removed all stains which in law might be attached to the memory of the great merchant.

NEW WING, NORTH INFIRMARY, CORK.

THE addition to this building which we illustrate in the present number has been erected from funds bequeathed by the late Lady COMBERMERE as a memorial to her father, Dr. GIBBINGS, who was for many years connected with the institution.

The difficulty attending the arrangement of the building on the extremely limited site at the disposal of the trustees in such a manner as would not overshadow the old building, and at the same time to maintain perfect lighting and ventilation of the new wards, led to the adoption of rounded ends to all the new portion. The result has been very satisfactory as regards the free access of light and air to every window.

The walls are brick and cement, built hollow, and faced with the South Buckley Company's buff facing brick and Portland stone dressings. In addition to the specially-made curved bricks, three-quarter moulded bricks were also specially made for the window-jamb, to avoid cutting. Credit is due to Messrs. E. & P. O'FLYNN, the builders, for the careful way in which the work has been carried out. The floors are concrete, and iron joists with tongued red pine boarding in the wards, and marble mosaic floors in the other portions. The roof is constructed in a similar way and covered with asphalt, forming a valuable airing-ground for the patients, part of which is under glass. The architect is Mr. ARTHUR HILL, B.E., M.R.I.A.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, when the president, Mr. J. Macvicar Anderson, delivered his annual address to students on

Some Aspects of the Mutual Relationship of Architects.

The PRESIDENT said:—On the first occasion on which it was my privilege to address you, I directed your attention to the consideration of what is probably the most important subject to which an architect can devote his studies, the art of planning; for on the successful development of that art depends the daily comfort, convenience, and therefore to a great extent the happiness, of the community. Hence it is impossible to over-rate the crucial importance of the subject, or to impress it too strongly on the minds of those who, as students, are about to embark on their career as architects. The mistaken idea that such work as planning is not art has led many who should have known better to derogate it to a position of comparatively minor importance. He who regards planning as inartistic or unimportant has no claim to be a true architect. When addressing you last year I offered some suggestions in reference to the varied and extensive responsibilities which you will as architects be called on to discharge to clients, contractors, artists, tradesmen and others. I propose now to confine what will be my final words to you from this chair to one other position which you will occupy—your relationship to the members of your own profession, a relationship second to none in interest, for surely no right-thinking architect can disregard the advantage of possessing the good opinion of his professional brethren in respect alike of his works and of his character.

Master and Pupil.

Let me first touch on the preliminary aspect of this question—the relationship between master and pupil, of which some of you probably have already had experience. Notwithstanding the remarkable expansion of educational facilities in recent years, I suppose the old-fashioned system of pupilage which prevails in this country not only holds its own, but is likely to find increasing favour. In days gone by, when educational facilities—other than those which were to be casually picked up in an office—did not exist, it was perhaps not unnatural that the system of pupilage should be liable to abuse, because the only, or nearly the only, means of acquiring knowledge was from such information as the master might choose to impart. Hence the pupil was to a large extent, if not solely, dependent on the master, and in such circumstances a niggard spirit of exaction on either side would surely conduce to a relationship the reverse of satisfactory. In these later days this is not likely to occur, for the pupil is not now solely dependent on his master for the acquisition of knowledge. The air is full of educational courses, curricula, syllabi, lectures and classes, and the remarkable success which many of these have attained demonstrates how much they were needed. The creation and continuing elaboration of such educational facilities has materially altered the relations which formerly existed between master and pupil. It is true that students must to some extent take advantage of such facilities after office hours;

but I think that, in receiving a pupil and accepting a premium with him, a master is now bound, not merely to extend to him the advantages of training in his office, but, in addition, to recognise the existence of educational institutions outside, and to afford to his pupils reasonable facilities for profiting by them. And if this be so, what is the corresponding claim on the pupil? Obviously that, in enjoying the privilege of opportunities of study apart from the office, he is bound to devote himself with all the keener application to the work of the office while in it. No office can be properly conducted without discipline. Regularity, application, system are indispensable. If, in an enlightened and liberal spirit, hours are set apart in which pupils can engage in outside study, they should be rigidly and loyally adhered to. To fail in this is not merely loss to the individual, but injury to others, for the force of example is great, and no one can release himself, even thus early in life, from exercising influence on others—it may be for good, it may be for evil, but it must be for one or other.

One valuable branch of study outside the office, for engaging in which a master should always be glad to afford his pupils facilities, is that of sketching and measuring old buildings. To any one possessing the gift of artistic draughtsmanship this is an enchanting occupation, although not free from a seductive, and even dangerous, tendency. To make pretty sketches, however fascinating, is not the object in view. Far be it from me to detract from the charm of artistic sketches, but what I insist on is that in sketches of old work the primary requirements are accuracy and clearness, lines well defined, forms and proportions true, joints and construction expressed, and dimensions clearly figured. Such sketches should be finished on the spot, and should not be touched up afterwards. By such subsequent treatment they may lose some of their charm, and must lose much of their value, for if not finished at the time they cannot be guaranteed as accurate delineations. That this subject is rightly regarded as of great importance is illustrated by the prizes offered here and elsewhere for measured drawings and sketches; and while, as I have said, masters should always afford facilities, pupils should never lose opportunities for engaging in it. The eye as well as the hand is thus trained to accuracy, and the mind is stored with useful knowledge. In view of the value attaching to work of this nature, I have thought that it would not be uninteresting or unprofitable to direct your attention to the measured sketches of an old master in architecture and his pupils, one whose memory—though he has long since passed away—still lives, and is likely to survive the changing fashions of succeeding eras. Palladio, as you all know, lived in the sixteenth century, having been born in 1518, and having died in 1580. The sketches exhibited, as illustrative of the manner of such work at the period referred to, form part of the Burlington-Devonshire collection, which, through the munificence of our honorary Fellow, the present Duke of Devonshire, have now become, under certain conditions, the property of the Royal Institute of British Architects. They are interesting as illustrating the actual manner of work of an eminent architect of the sixteenth century and his assistants, a period when architectural students did not glory in the manifold advantages which they enjoy in the present day. It is to be noted, too, that, apart from the character of the draughtsmanship, these sketches amply fulfilled their proper purpose, inasmuch as complete drawings of the buildings they represent—the Baths of Agrippa and of Caracalla—were afterwards made from them, and published in the great Earl of Burlington's book,* which you will find in the library. In further illustration of the manner of work of such masters, a selection from the drawings of the followers of the Palladian school in our own country—Inigo Jones, John Webb, and others in the seventeenth century, and of William Kent in the eighteenth—some of which are signed, is also exhibited; and in respect both of draughtsmanship and design, they may, in my humble judgment, be profitably studied by students, and, I venture to add, even by the architects of this privileged age.

Architectural Competitions.

Passing from such early relationship of master and pupil to more mature experience, many of you will, no doubt, find yourselves occupying the position of friendly rivals in architectural competitions. The general question of whether the system of competition is advantageous or prejudicial to the interests of architecture need not now be discussed. I have more than once recorded an opinion unfavourable to the system, and I see no reason to alter it. I fear, however, that whether we like the competitive system or not, we must accept it as an established fact, and as practical men, therefore, our efforts should be directed to mitigating its evils, as I should say—or emphasising its advantages, as others may think. There can be no doubt that much has already been accomplished in this direction by the Royal Institute. I have observed that the paper of "Sug-

* *Fabbriche Antiche disegnate da Andrea Palladio Vicentino e date in luce da Riccardo Conte di Burlington. Fo. Lond. 1730.*

gestions for the Conduct of Architectural Competitions," which we publish, is very generally referred to and adopted by promoters of competitions throughout the country, and I cannot but recognise that—in spite of occasional enormities—there is now a more general desire to treat architects well than was formerly the case. In my experience as assessor, I have happily succeeded, in more than one instance, in prevailing on promoters to recast conditions which had already been drawn up although not issued, in such a way as to expunge all objectionable features and to make them perfectly fair and satisfactory. It is gratifying to be able to record the growth of such a spirit of equity and liberality on the part of promoters as has rendered this possible. In some cases, however, conditions are drawn and issued before the assessor is consulted, as, for example, in the recent competition for the extension of the Pump Room at Bath. When this is the case, all the assessor can do is to select the best designs in conformity with the conditions, apart from the question of their excellence or otherwise. I confidently assert that in every such instance which has come under my own cognisance, the promoters have suffered from not having called in a professional expert to advise them from the outset.

The question whether promoters should be bound to adopt the award of their assessor is one which admits of a good deal of discussion. It is argued on one side that it is only human nature for those who are going to spend money on the proposed building to reserve to themselves the right of ultimate selection, while, on the other hand, it is asked, What is the use of taking professional advice unless it is adopted? In regard to the first, it should be borne in mind that in almost every competition the promoters do not spend their own money, but that of rate-payers or subscribers, and that they consequently are only agents between the capitalist and the profession, while in regard to the other view it does not seem to me to be a *sequitur*, however desirable, that because you call in professional advice you are bound to act on it. I confess, however, that my sympathies are all in favour of unreserved powers being conferred on the assessor. If it is desirable to secure expert skill in the preparation of the competitive designs, is it not equally so in regard to their selection? At all events, I am satisfied that an assessor, when consulted as to the conditions, should allow no mistaken feeling of delicacy to deter him from securing, if possible, the ultimate decision for himself, on the ground that nothing will tend more to inspire confidence in competitors than the insertion of such a condition. He cannot, of course, insist on this, but if he exercises ordinary tact I am convinced that in nine cases out of ten he will succeed. Such has been my own experience, for in more than one case I have obtained this concession contrary to the expressed desire of promoters. Whatever may be thought, however, as to the respective rights of promoters and assessors in this respect, there can be no manner of doubt that the interests of architecture are best promoted when the final decision is left unrestrictedly in the hands of the professional assessor. An apt illustration of this is the recent Pump Room competition at Bath, already referred to. The promoters reserved to themselves the ultimate selection, and in the exercise of this right adopted the design which Mr. Waterhouse had placed second in preference to the design to which he awarded the first premium. In view of the sequel, how infinitely better would it have been for themselves and all concerned had they adopted the award of Mr. Waterhouse? I did what I could to press this view upon them, but ineffectually. A unique feature in this competition—and one which I trust may remain so—was the circumstance that the competitor who was placed second by Mr. Waterhouse, and whom the promoters determined to place first, turned out to be an official of their own who had himself drawn up the conditions. One can scarcely conceive a greater act of impropriety, or one more absolutely unfair to other competitors, and yet a proposition was actually made to the effect that a second competition should be instituted between the three competitors selected by Mr. Waterhouse, one of whom was the official in question. My advice was sought in regard to this proposition before it was brought forward, and it was given unhesitatingly to the effect that there was only one course to pursue, namely, to adopt Mr. Waterhouse's award in respect of the design he placed first, to disqualify the second, to give the second place to the design he placed third, and to ask him to select a design to take the place of the latter; further, that in any circumstances the offence of the official in question was so grave that he should be absolutely precluded from having any further connection with the matter.

Another illustration of the advantage of the decision of the assessor being final occurred recently. The conditions had been issued and the designs received before I was consulted. While leaving my judgment free—for otherwise I would not, of course, have accepted the appointment—the promoters requested me to consider the designs in a recommended order of merit. It so happened that as regards such order the first had to be last, and the last first, or nearly so, for the design which was far and away the best in every respect, and which I

accordingly placed first, was last but one, and the one which beyond comparison was the least meritorious occupied the first place in the suggested order of merit. It is satisfactory, however, to add that the promoters appreciated the reasons which I put before them for my selection, and at once adopted my award.

The relation which competitors bear to one another is, or should be, so simple and clear as not to require definition, and yet a recent instance demonstrates that this is not necessarily the case. We expect, and rightly expect, fair dealing on the part of promoters; and they and we have the same right—neither more nor less—to expect fair dealing on the part of competitors. The unmistakable course for competitors to follow is to comply strictly with the spirit and the letter of the instructions. When conditions are properly drawn, there should be neither doubt nor difficulty in doing so. Such obvious procedure was singularly disregarded in the case of a competition held not many months since. The conditions were evidently drawn with the intention of precluding any chance of the identity of competitors being disclosed, and yet I regret to state that an architect, who at the time was a member of one of our allied societies and an Associate of the Institute, did not scruple to contravene the conditions by disclosing his identity—not, it is true, by signing his drawings, which would have been manly, though perhaps quixotic in view of the conditions—but by means which we could not but condemn, and which were indignantly disowned by his provincial brethren. I need scarcely add that the architect in question is no longer an Associate of the Institute nor a member of the allied society: so far, well; but the pity is that the credit of the profession should have been even temporarily tarnished by such conduct on the part of one of its members.

Criticism.

Those of you who possess literary ability may sometimes find yourselves placed in positions of delicacy and difficulty in relation to your professional brethren. A facile pen is an acquisition greatly to be desired when guided by truth, knowledge and charity; it becomes a dangerous power when influenced by prejudice, envy, or ambition. Nothing is more easy for one possessing this power than to write sharp philippics which will insure an approving laugh from the unthinking—but what of the keen wound they may inflict on some sensitive nature? Nothing is so easy as to write disparaging criticisms—for the discovery of real merit calls for study—but what if they are wide of the mark and suggest misleading conclusions? No one should venture to criticise the work of others without first honestly trying to place himself in the position of the author of the work criticised, and to realise the difficulties he had to contend with. Viewed from a general standpoint, a work may be severely censured, which, regarded in the light of the circumstances in which it was conceived, may rightly be accepted as a triumph. This is specially true as regards architectural criticism. How often do our critics and reviewers strive to realise and to make allowance for the difficulties and the hindrances which surrounded the inception or the execution of the work criticised? How often do such considerations influence the pens of ready writers? Alas! for the rarity of Christian charity. It is to be feared that the literary reputation of the critic is too often the influencing motive, regardless of the feelings of the author, and of the difficulties he had to contend with. Be assured your criticism of the work of others will be none the less pungent, and will be all the more appreciated if your pen is divorced from prejudice and thoughtlessness, and inspired by truth and knowledge, seasoned with brotherly kindness.

Witnesses.

You may be called on to aid by your testimony as experts in influencing judgment for or against your contemporaries. It has ever been—and I suppose it ever will be—the case that men will differ. Even the highest code of morality anticipated this in the qualified injunction, "If it be possible, as much as lieth in you, live peaceably with all men." No doubt there are some to whom the injunction does not apply, inasmuch as to live at peace with anyone seems to be with them a sheer impossibility; but even with those who are peaceably disposed, circumstances will occasionally arise involving a principle which they cannot concede, and which render it necessary to appeal to the help of others either in law or arbitration. I cannot claim to speak on this subject as an expert, my appearance in courts of law having happily—although unfortunately, too—been restricted to the discharge of the wearisome duties of a jurymen; but it has sometimes vexed me to hear some of my professional brethren, whom I knew to be men of probity, censured by others for appearing as witnesses and giving testimony against them. Such experiences, which are by no means restricted to the profession of architects, may be thought to be unedifying, and I confess that I regard the relationship as perhaps the least desirable and the most inartistic which an architect can occupy; but yet I fail to see why the witness should be the subject of censure more than he against whom he

testifieth. Is it not the fact that the last-named is frequently the original sinner? How can light be thrown on a purely technical point other than by the evidence of experts? and how can such evidence be obtained if none will appear as witnesses? How can questionable or derogatory proceedings be exposed if reputable men will not come forward to testify against them? Further, why should it be thought strange that men of the same craft should differ in the witness-box, so long as it is a patent fact that in scarcely any topic of ordinary conversation in society will the same view be taken? In this relationship the rule of guidance appears to me to be clear and simple. Do not consent to give evidence as to the works or character of a brother architect unless you are perfectly sure that you can testify from the safe basis of experience, and in the honest belief that what you testify is truth.

Etiquette.

No dissertation on the relationship in which professional men stand to each other would be complete without some reference to the subject of professional etiquette. We have heard etiquette condemned. We have been told of the triumph of prejudice and jealousy to the detriment of the welfare of client or patient. We have even heard whispers of the neglect of patients rather than the consultation with the rival practitioner which might have saved life. Such rumours—if, indeed, they are true—are at best but exaggerated indications of exceptions which prove the rule. Etiquette gives honour where honour is due; it rightly exposes impostors. Etiquette appreciates ability and encourages merit; it scathingly condemns the individual and the society that live on borrowed plumes, assuming virtue if they have it not. Etiquette generously extends the arm of sympathy; it would rather cut off the right hand than by word or deed injure others for the sake of personal aggrandisement. Etiquette recognises all honourable methods of advancement; it rightly looks askance at questionable expedients of self-advertisement, such as are too frequently resorted to. In a word, etiquette is the standard which unerringly gauges the reputation of professional men. Above the level of the gauge is to be found all that is honourable and commendable; beneath it all that is grovelling and unworthy. In the Harveian oration delivered at the Royal College of Physicians last October by Dr. Pye Smith, this subject was so happily delineated that I cannot refrain from quoting the words of the Harveian orator:—"Professional etiquette really means the observance of those rules which distinguish a profession from a trade, which make our calling honourable as well as honest, which check the arts of advertisement and direct our ambition to obtaining the suffrages—not of the public which cannot—but of our profession which can—judge truly, rules of conduct which are, in fact, nothing but the carrying into daily practice of the golden rule, to do to others as we would they should do to us."

Sir Frederick Leighton's Addresses.

Although my subject is the relationship that exists between members of our own profession, I must before closing crave your indulgence while for one moment I stray beyond it, for the purpose of directing your particular attention as students of architecture to the very remarkable addresses on the arts, and more especially the architecture, of different countries, which have been recently delivered by one who is not a member of our profession. For many years we have been accustomed to regard Sir Frederick Leighton as a man of great parts and exceptional culture. To refer to his works as a painter would be superfluous; his claim to be a sculptor of no mean order is indisputable; and as if this were not sufficient, the subject of his more recent addresses to the students of the Royal Academy has led him, as it were inadvertently, to demonstrate that in regard to the art of architecture he possesses an intelligent and a critical grasp of the subject second to no modern author. To few indeed is it given to combine with wide historical research and keen critical acumen the indescribable literary charm of composing poetry in prose. Let me commend to your thoughtful attention the study of these singularly learned and graceful discourses.

In now uttering my parting words to you from this chair, let me wish you God-speed in the elevating career on which you are entering, a career which is the unique embodiment of the ideal and the useful. In the pursuit of it you will not, it is true, be enfranchised from those hindrances, anxieties and worries which are incidental to all human engagements; nor will you have as your goal the accumulation of wealth, which so many regard as the chief end of man, though it is far, very far, from being so in truth; but, if inspired by a generous spirit of devotion, such as should ever be the characteristic of the student of art, you will not fail to find in it as much pure enjoyment and as much ennobling aspiration as you are likely to attain in any avocation in which you could engage.

[Mr. A. Graham's paper on the prize works will appear next week.]

THE ILLUSTRATION OF BOOKS.*

CONSIDERING the small amount of interest which the author—whether historian, poet, essayist, man of science or discoverer—seems to take in the production of his book, and the personal interest with which he might endow it, let me draw a picture of the average author of to-day—or yesterday; the "man of letters," the student, who lives apart from the whirl of journalism and hand-to-mouth literature. The picture may be a little fanciful, but it is intended to be suggestive, not only to the author, but to all who are engaged in the production of books, whether "olde style" or otherwise.

If there be one characteristic which should enhance the interest attaching to the expression of a writer's thoughts, it should be that his individuality, or personality so to speak, should be in some way expressed on the printed page. Chaucer, Shakespeare, Milton, Scott, Byron, Dr. Johnson, and the men of letters of the past are, each of them, deeply interesting to us in their personality, in their costume, in their handwriting, and in whatever they have left behind them as the work of their own hands. As matters stand at present, the high pressure of work imposed upon anyone who has something to say is turning the picturesque figure of the "author" (as we read of him in past times) into a more or less highly-strung, pre-occupied, steam-driven "literary machine."

Looking backward to the Victorian age (say from the end of the twentieth century), what pictures will be formed in the minds of those who come after us of the *entourage* of the man of letters of to-day? Clothed in a degrading, characterless costume, which takes all appearance of manliness and suppleness from his figure, living in houses and in cities in which nearly everything ornate or beautiful has been stolen, borrowed or copied from another country or period, he is found engaged in the production of books in which, as far as the mechanical parts are concerned, nearly everything is a sham.

The nineteenth-century author's love for the literature of his past has led him to imitate not only the style, but the outward aspect of old books; and, by a series of frauds (to which his publisher seems to have lent himself only too readily), to produce something which appears to be what it is not.

The genuine outcome of Mediæval thought and style—of patience and leisure—is treated at the end of the nineteenth century as a fashion to be imitated in books, such as are to be seen under glass cases in the British Museum. The twentieth-century reader, looking back, will see few traces worth preserving, either of originality or of individuality.

The typefounder of to-day takes down a Venetian writing master's copy-book of the sixteenth century, and imitating exactly the thick downward strokes of the reed pen, forms a set of movable type, called in printer's language "old face," a style of letter much in vogue in 1893; but the style and character of which belongs altogether to the past. Thus, with such aids, the man of letters of to-day—living in a whirl of movement and discovery—clothes himself in the handwriting of the Venetian scholar as deliberately as the Norwegian disguises himself in a bear skin.

The next step is to present in his book a series of so called "engravings," which are not engravings. The advance of science in producing blocks from photographs of steel and other intaglio plates, for the type printing-press, at a small cost per square inch, is not only taking from the artistic value of the modern *édition de luxe*, but also from its personal interest and genuineness.

The next step is to manufacture rough-edged, coarse-textured paper, purporting to be carefully "hand-made." The rough edge, which was a necessity when every sheet of paper was finished by hand labour, is now imitated successfully by machinery, and is handled lovingly by the book-worm of to-day, regardless of the fact that these roughened sheets can be bought by the pound in Drury Lane. The worst and last fraud (I can call it no less) that can be referred to now is, that the clothing—the "skin of vellum"—that appropriately encloses our modern *édition de luxe* is made from pulp, rags and other *débris*. That the gold illuminations on the cover are no longer real gold, and that the handsomely bound book, with its fair margins, cracks in half with a "bang," when first opened, are other matters connected with the discoveries of science and the substitution of machinery for hand-labour, which we owe to modern enterprise and invention.

But, if it be impossible in these days (and in spite of the efforts of Mr. W. Morris and others it seems to be impossible) to produce a genuine book in all its details, it is worth considering in what way the author can stamp it with his own individuality; also to what extent he is justified in making use of modern appliances.

How far, then, may the author be said to be responsible for the state of things just quoted? Theoretically, he is the man of taste and culture *par excellence*; he is, or should be in most

* From the Cantor lecture, by Mr. H. Blackburn, delivered at the Society of Arts.

Cases, the arbiter, the dictator to his publisher, the chooser of style. The book is his, and it is his business to decide in what form his ideas should become concrete; the publisher aiding his judgment with experience, governing the finance and carrying out details. How comes it then that, with the present facilities for reproducing anything that the hand can put upon paper, the latter-day nineteenth-century author is so much in the hands of others as to the appearance of his book? It is because the so-called educated man has not been taught to use his hands as the missal-writers and authors of Mediaeval times taught themselves to use theirs. The modern author who is, say, fifty years old, was born in an age of "advanced civilisation," when the only method of expression for the young was one—"pothooks and hangers." The child of ten years old, whose eye was mentally forming pictures, taking in unconsciously the facts of perspective and the like, had a pencil tied with string to his two first fingers until he had mastered the ups and downs, crosses and dashes of modern handwriting, which has been accepted by the great as well as the little ones of the earth as the best medium of communication between intelligent beings; and so, regardless of style, character or picturesqueness, he scribbles away. So much for our generally straggling style of penmanship. Looking at the handwriting of to-day, what wonder that a writer of any taste or feeling should hesitate to distribute his deformities through the world by means of facsimile reproductions, and yet we desire to see the handwriting of our favourite author. But handwriting in our generation is so singularly mean and inexpressive, it has arrived at such a point of indistinctness and slovenliness amongst men, that (it is sad to say it) refuge is now taken in the American type-writing machine.

But we are told that we are shaking off our trammels, and that all these modern inventions are to set the spirit free; and so, to shorten our journeys on the road to knowledge, we are to have recourse to the "typewriter" and its most monotonous lines. Should we not rather reform our own handwriting once for all? First study a system of shorthand for rapid notes, and then learn to write so clearly and distinctly that a facsimile of it would be a delight to read on the printed page.

Consider the question in all its bearings. The time has come when, for the first time in the history of the world, any lines drawn or written can be reproduced in facsimile, from which thousands of copies can be printed. There is no occasion to repeat the details; once realise the fact that your handwork can be made to appear clearly on the printed page (with little more expense than type-setting), and you—the young author, student, man of letters—will give us in the future more of your interesting personality. The thoughts may flow as before, but the vessel to receive them and convey them to others shall have its hall-mark of individuality.

Thus in the future the distinction will be more clearly drawn between the work of the student on the one hand, and journalism, hack literature and "penny dreadfuls" on the other. Type-setting and uniform printing of words by the thousand will be used as before, but the "author"—for want of a better word—the poet, and the scholar, who gives a book to the world, should free himself (as much as possible) from mechanical trammels, and boldly set to work to present himself in appropriate guise. The beautiful photographic processes which have been perfected during the last few years will facsimile a page so accurately, that it is wonderful that so few of our artistic countrymen have availed themselves of them. Had such processes as those now in use in England, France and Germany been in existence in the time of the early engravers, there would probably have been no such thing as wood-engraving, for the chroniclers and artists, from the engraver of St. Christopher to Bewick, would have hailed the new methods with delight. What we might have lost or gained artistically cannot be considered now. The question for the moment is how to rouse sufficient interest in these matters amongst authors.

Let us take the poets first. They have comparatively little to do with the outer world; but the public, rightly or wrongly, is eager to know more of their personality. They, the elder, the professional poets, live, most of them, in an atmosphere of cloistered silence, of repose and picturesqueness, more akin to Mediaeval times than to railways and telegraphs. They come out to greet us in a garden of flowers, where nature forms herself into pictures all around. Is it not a poor thing that they can record little or nothing of their surroundings pictorially—no mental impressions except in type-set words? With the exception of the late Lord Tennyson, it is difficult to think of any poet of our day whose personality is well known and cared for by the public. Modern dress, and the fear of appearing to "pose" in these advertising days, has led to the neglect of many outward things which the historian would hold dear.

The moral may well be drawn. Equip yourself in more ways than one for expression by the pen; to you who write, in times when it is impossible to be personally picturesque, remember that anything drawn or written by your own hand

may be of interest in the future. These are things that the artist, as well as the author, may bear in mind, as in the future they will work much more in concert and consider together the setting-out of a page, the harmony of text and illustrations and appropriate ornament on page and binding.

Is the "setting-out of a page" one of the lost arts, like the designing of a coin? What harmony of style do we ever see in an ordinary book? How many authors or illustrators of books show that they care for the "look" of a printed page? The fact is that the modern author shirks his responsibilities, following the practice of the greatest writers of our day. There are so many "facilities"—as they are called—for producing books that the author takes little interest in the matter. Mr. Ruskin, delicate draughtsman as he is known to be, has contributed little to the *ensemble* or appearance of the pages that flow from the printing-press of Mr. Allen, at Orpington. How well his books are printed you can see presently, but judged by the past a deadly monotony pervades the page; the master's noblest thoughts are printed exactly like his weakest, and are all drawn out in line together as in the making of macaroni. Mr. Hamerton, artist as well as author, is content to describe the beauty of forest, trees, ferns and flowers, the variety of underwood and the like (nearly every word, in an article in the *Portfolio*, referring to some picturesque form or graceful line), without indicating the varieties pictorially on the printed page. Tennyson and other poets have been content for years to sell their song by the line, little heeding, apparently, in what guise it was given to the world; and so the monotony of uniformity pervades the pages alike of great and small, and a letter from a friend is now often printed by a machine. The last stage of feebleness and admission of incompetence in the matter of using our hands which I may touch upon here seems to have been reached in the indiscriminate use of the typewriter, for which, as a satirical writer lately remarked, "There is something to be said, as many of our scientific friends have been able to communicate their ideas in a letter for the first time by this means."

Let us now look at some slides in illustration of what I have called the "decorative page," with and without pictorial illustrations.

1. Example of early Venetian writing from a copy-book of the fifteenth century written with a reed pen. See the clearness of the page and its picturesqueness; also its similarity to the type letters used to-day—what are called "old face"—the origin of what is known as Caslon type and of much (good and bad) letter in modern books.

2. A beautiful example of Gothic writing and ornament from a French illuminated manuscript in the British Museum, date 1480. Here the decorative character and general balance of the page is delightful to modern eyes.

3. Facsimile of a printed page from Polydore Vergil's "History of England," produced in Basle in 1556. The style of type is again familiar to us in books published in 1893, but the setting out of the page, the treatment of ornament (with little figures introduced, but subservient to the general effect), is not familiar, because few of us can produce a decorative page. The printer of the past had a sense of beauty and of the fitness of things apparently denied to all but a few to-day.

4. An illuminated printed page, 1521, with engraved borders, after designs by Holbein; figures again subordinate to the general effect.

5. Example of a page—Italian, fourteenth century—ornament, initial and letters forming a brilliant and harmonious combination.

In all these pages, it will be observed, what is called "colour" in black and white is preserved throughout. Closely criticised, some of these block designs may appear crude and capable of more skilful treatment; but our object is to study the effect of a page without "illustrations" in the modern sense of the word—to see how colour and breadth is obtained in pure line. In these and similar pages, such, for instance, as "Le Mer des Histoires," produced in Paris by Pierre la Rouge in 1488, the harmony of line-drawing with the type letters is most interesting and instructive at the present time. It may be attained in line but never in wash-drawings reproduced by the processes.

It is in the production of the decorative page that wood-engraving asserts its supremacy still, as may be seen in some beautiful books produced in England during the past year, which we will examine after the lecture. Mr. William Morris's books, which he has kindly lent us—where artist, wood-engraver, type-founder, papermaker, printer and bookbinder work under the guiding spirit (when not the actual handwork) of the author—have been fully described elsewhere. They are interesting to us rather as exotics: an attempt to reproduce the exact work of the past under modern conditions—conditions which render the price within reach only of a few. But they are at least a protest against the modern shams of which I have spoken to-night.

From an economical and practical point of view, and as a

new departure in modern illustration, I would rather point to the work produced by an art school, where an educated and intelligent mind seems to have been the presiding genius; where the illustrators, whilst they are fully imbued with the spirit of the past, have taken pains to adapt their methods to modern requirements. I refer to the Birmingham Municipal School of Art. Whilst using wood-engraving freely, the illustrators of Birmingham, notably Mr. Gaskin, have shown, as in the page before you, what can be done in line-drawing by the relief processes to produce colour and ornament which harmonise well with the letterpress of a book. This seems an important step in the right direction, and if the work emanating from this school were less apparently confined to an archaic style, to heavy outline and Mediaeval ornament (I speak from what I see, not knowing the school personally), there are possibilities for an extended popularity for those who have worked under its influence.

In conclusion, then, let me say that every one who cultivates a taste for artistic beauty in books, be he author, artist or artificer, may do something towards relieving the monotony and confusion in style which pervades the outward aspect of so many books. It is a far cry from the work of the missal writer in a monastery to the pages of a modern book, but the taste and feeling which were shown in the fifteenth and sixteenth centuries in the production of books exist in the nineteenth (as we know), but under the difficult conditions of our times.

In the book of the future we hope to see less of the "lath and plaster" style of illustration, as produced from careless wash-drawings by process; fewer of the blots upon the page which the modern reader seems to take as a matter of course. In books, as in periodicals, the illustrator will have to divest himself, as far as possible, of that tendency to scratchiness and exaggeration that injures so many process illustrations, as pointed out in the first lecture. In short, he must be more careful and give more thought to the meaning of his lines, to the adequate expression of textures and the like. There is no reason why the texture of a man's coat should look like straw, or the background to a figure have the appearance of fireworks. No amount of ability on the part of the artist will make these things tolerable in the near future.

In "the book of the future" the author may do more than he has ever done, as I have already suggested; a volume of instances might be given where a writer's meaning could be more clearly expressed pictorially than verbally. The subject is not half ventilated yet, nor can I touch upon it further tonight; the day is not far distant when the power of the hand of the author will be tested to the utmost and lines of all kinds will appear in the text. There is really no limit to what may be done with modern appliances, if only the idea is seized with intelligence; the journalist of the future will also aid unconsciously in the formation of a new language which every nation can understand.

INSTRUCTION IN ARCHITECTURE.

THE first of a series of twenty lectures on the history of architecture was delivered on Saturday, at the Queen's College, Cork, by Mr. Arthur Hill, B.E., M.R.I.A., architect. The lecturer said:—Before entering on the immediate subject of these lectures I would like to say a few words respecting the present educational requirements of the architectural profession. The only lectures available for architectural students in the Metropolis, and as far as I know in the kingdom, until recently, were those given by Professor Hayter Lewis, on "The History of Architecture" and on "Building Construction," at London University College, and a somewhat similar course at King's College. To those who desired to enter the profession at that time there was practically no other means of obtaining a knowledge of architecture but to enter an architect's office. As it seldom happened that the principal had sufficient leisure to become a tutor, the training of the youth entirely depended on his own capacity to pick up and digest the various fragments of professional practice that happened to come before him in the ordinary routine of office work. There was nothing whatever to compare with the well-organised scientific education afforded young engineers here in Cork, and in most of the other universities in the country where an insight is given of the principles that underlie a profession before being introduced to the vortex of its practice. In a paper read before the Conference of Architects held in 1874 I had an opportunity of advocating the claims of architecture to be put on the same level, regarding educational facilities, as engineering, and suggesting the addition of an architectural department to the several engineering schools already existing in the country. At another conference held in 1887, where the question of education occupied somewhat a more important part, I again put forward the same plea. Since then the scene has changed considerably.

A few years ago the Royal Institute of British Architects adopted an examination scheme which was at first on a volun-

tary basis, but now the system is in full force, and virtually closes the doors of the Institute against all but those who succeed in passing a fairly extensive educational test consisting of a preliminary, intermediate and final examination. The preliminary examination is equivalent to an ordinary matriculation to test general education. The intermediate examination requires (1) A knowledge of the history of architecture, the various styles and their characteristic mouldings and ornaments. (2) Building construction, the nature of materials and calculation of strengths. (3) Elementary physics. (4) Land surveying and levelling. (5) Geometry and perspective. The examination extends over two days. The final examination requires seven days. Two days are given to making a design for a building before the examiners, and the remaining five days are devoted to oral and written examination in (1) the history of architecture, and (2) construction of a higher grade than what was expected of a probationer, besides (3) hygiene, drainage, water-supply, ventilation, &c., (4) professional practice, specifications and estimating.

Such training as will enable young men to pass this examination is, therefore, at the present time a necessity which has made itself felt throughout England, and in many places efforts are being made to help those whose road to a professional career lies through the gate of examination. Besides the lectures given at King's College and University College, London, the Architectural Association, originally established as a junior society with classes for the mutual improvement of its members, has converted itself into what is little short of a college of architecture—a very bold step for a private society to take, and one that deserves to succeed. The classes are divided into "lectures" and "studio work," and extend over a four years' course. In the provinces there are already several localities where specially organised courses of instruction for architectural students have been arranged:—Manchester Technical College, Glasgow Technical College, and also at the Glasgow School of Art, Durham College of Science, Bristol University College, Birmingham School of Art, also in Sheffield, Nottingham and Leicester, and as far north as Dundee the local art and technical schools are used for the purpose. In Liverpool and Leeds, thanks to grants made by the local authorities, lectures of great value are now being given in these subjects.

In considering the suitable education for an architect, it should not be forgotten that architecture is both a science and an art, and that the concurrent development of both these departments is essential. A constructor who is not an artist, or an artist who cannot build, are neither worthy of being called architects. To any local student who may wish to know the best way to prepare for a professional career, I should say, in the first place, complete your engineering course here, as in the direction of scientific training there is nothing better to be had, and for the development of your artistic faculties attend the school of art, study drawing in every department, shading, colouring and modelling, working from the antique and from the life.

The course of lectures upon the "History of Architecture" about to be inaugurated here is designed to give some idea of the great works of preceding ages, their construction and decoration, and the various transformations that occurred from time to time as nations rose and fell. It by no means embraces all that goes to make a complete school of architecture and is but a step in that direction. Of course a properly directed study of ancient buildings does not provide us with a sort of "ready-made department" by means of which any figure can be promptly clothed in any desired fashion. But to know something of the way in which our predecessors built, how their different needs were satisfied and the uses they made of various structural combinations and decorative methods must tend to raise the love for conscientious design, besides being the only way in which an architect's taste can be formed.

Beside the purely professional aim that these lectures are intended to have, they may also prove interesting to those who have sufficient leisure to devote to the study of the arts. The great works of architecture and sculpture produced in Greece two thousand years ago—still regarded as canons of good taste, and in some cases unsurpassable—could never have been produced but for the appreciation with which they were received, and the high standard of public taste existing at the time. There is nothing that would have more influence on architecture as an art than a wider study of its principles by those who are destined to be its patrons. Every one cannot afford to possess a painting by a great artist (though the trade show-card of the present day has almost turned the cottage into a picture gallery), yet all are free to admire a public building. How much more interesting our cities would be if every building in the streets were to possess each some special character of structure or decoration that would turn it from a commonplace building to a work of art. This may be somewhat of a Utopian dream, but it is by no means an impossibility. I have not yet said anything about the condition of professional education outside our own country, but on the

Continent the education of architects is provided for in State colleges in a similar way to other professions, and men are not allowed to practise without holding a diploma—a restriction which English architects do not think deserving of imitation. In America several of the universities have well-equipped schools of architecture, embracing a highly scientific as well as a thoroughly artistic training, and whether from this cause or some other, a most remarkable development of good work has recently taken place in that country. Mr. Hill then proceeded with the lecture on Greek architecture.

DESTRUCTION OF THE GREAT MOSQUE OF DAMASCUS.

THIS venerable structure was destroyed by fire at midday on October 14, and it is remarkable that the reticence of the Turkish authorities has prevented any particulars of the conflagration, or measures for rebuilding the mosque, from appearing in the papers.

Sir W. Muir, the principal of the University of Edinburgh, in a communication to the *Scotsman*, says:—

It is the ancient cathedral of John the Baptist, which, on the conquest of Syria, A.H. 14, was occupied one-half for Moslem worship, while the other half was left to the Christians. In 90 A.H. the whole was taken possession of as a mosque, other churches being restored in compensation. Only the walls now remain, the greater part of the building having been gutted by the fire. The rooms of Hussan and Hoosein were only slightly damaged. The tomb of Saladin was not injured. The library, with its precious MSS., was saved; but the famous copy of Othman's Koran (the only surviving one of the four deposited by him in the chief mosques of the empire, A.H. 30) was kept in a receptacle apart, and not thought of till it was too late.

The walls are still standing, and the edifice will probably be rebuilt on their lines; but the colonnade, which extended the whole length on each side of the mosque, was destroyed, and though every effort will, no doubt, be made to restore the building to its pristine grandeur, its glory, one may fear, has passed away. Mohammed Saeed Pasha (for some years the leader of the pilgrimage from Damascus to Mecca) is said to have contributed 1,000*l.* towards the reconstruction; and a rescript is believed to have been received from Constantinople for the formation of a Commission to obtain contributions, the Governor-General being president and several civil and military officers, with leading citizens, as members. It is said that at their first meeting objection was made to the resort to pressure, as it would render unacceptable prayers offered in the new building, but little attention has been paid to the objection. Great enthusiasm undoubtedly prevails among the citizens in the work. Early in December a commencement was made by removing the *débris* to prepare for the rebuilding. The different quarters of the city send in large bodies of men to help, and the zeal is so great that even the female sex (including, one hears, even ladies of the Viceroy's harem) claim the privilege of aiding in the pious service of cleansing the sacred edifice from the off-scourings of the conflagration. It is said that the Shiah sect (*Rafideh* or *Arfad*, as they are called there) claimed the right of taking some part in the work, but were refused, and there was for a time some danger of a riot. About a month ago a gentleman, riding with his wife and son outside the gate, met a party of hundreds of men bringing a load of immense poplar beams, which they were drawing in a cart by ropes, with vociferous singing and clapping of hands. They turned sharply by another road, as it is hardly safe for a Christian to get among them in their present mood.

It is not very easy to understand why the Press has been prohibited from notices of the misfortune. No doubt the destruction of the Imperial Mosque of the Omeyyads had a very depressing effect on the city at the time. Whether the Government of the Porte feared a similar feeling on the Moslems elsewhere, or whether the news of the destruction of their famous mosque might be taken by the world at large as a fresh indication of the decay of the Turkish empire and Moslem prestige, it may be difficult to say; but such is believed to be the idea prevalent.

The Christians were accused by some at the time of the conflagration; but as it broke out in the daytime a little before noon, and began in the high roof of the building, the accusation was so manifestly baseless that it had little or no influence on the Mussulman population. Had it occurred at night, when the cause would not have been so clear, the imputation might have met with a readier acceptance, and it is impossible to tell what then might have been the consequences to the Christians. Moreover, there was a high wind in the direction of the Christian quarter, and if it had occurred in the night, when the inhabitants were asleep, the fire in the city would no doubt have been much more extensive. As it was some eighty to a hundred shops and twenty to thirty houses caught fire from the cinders on the south and east, the direction in which the wind was

blowing, but it was speedily extinguished. By night the danger would have been vastly greater, and with a fanatical mob excited by accusation against the Christians, their quarter might have been burned to the ground and plundered, with even a repetition of the terrible massacre of 1860.

It is a matter of interest that the famous Greek inscription is uninjured. It is on the door lintel over the silversmiths or sandal-makers' bazaar, and consists of the 13th verse of the 145th Psalm, with the addition of "Christ." Thus:—"Thy kingdom, O Christ, is a kingdom of all ages; and thy dominion from generation to generation." The survival of this inscription through the change of ages—a monument of the past, and it may be a prophecy of the future—is a thing to be noted, and is due, no doubt, partly at least, to its purport being generally unknown to the Moslems around.

THE STUDY OF ART.

THE prizes won in the Sketching Club competitions at the Manchester Municipal School of Art were distributed on the 12th inst. by Sir James D. Linton. In his address he said he had a strong objection to the ordinary lecture or discourse on general art subjects. Most of the matters referred to in such addresses they could read about for themselves in books, especially in that masterpiece of English prose, "Modern Painters," by John Ruskin. It would be more profitable to them, perhaps, if he confined the few words he had to say to some of the drawbacks he experienced and some of the fallacies that beset him in his own early career. In the work of young students he saw very often evidence of a struggle for what was called originality. He remembered that in his young days that struggle was just as intense as it was now, but it was then accompanied by a greater amount of ignorance. Had he known what he now knew on that point he would have gained very much in his after life. The effort to obtain originality arose from a great confusion of mind. Originality was simply the outcome of one's individuality, and to strive for it early in life was just like trying to run before one was able to walk. He would advise the young student to proceed in just the reverse order. If they were landscape or figure-painters, or even sculptors, they should have no hesitation in laying all the masters they could meet with under contribution. In other words, he would steal everything he possibly could from them. The dread in the student's mind was that in so doing he might appear to his brother-students or the public to be absorbed by somebody else, and to be a mere reflection. But he should remember that he could not give expression to his originality or individuality until he had acquired the executive ability necessary to show it, and you could only get that executive ability by watching your great predecessors and stealing from them. It was in that manner that David Cox, a man with strong individuality in his work and colour and treatment, obtained his executive ability. That great genius allowed himself to be absorbed by the mind and manner of his master, old John Varley, a man of great executive ability, but that did not prevent Cox's own individuality coming to the surface. The same remark applied to Turner, who was in his youth a great imitator, but whose individuality afterwards came out in those superb works, some of which, he believed, were to be seen in the Municipal Art Gallery of Manchester. With regard to the Sketching Club, in connection with which they were met, he desired to encourage it as much as he could as part of the School of Art. He had known himself many very clever students who had passed through art schools and taken prizes and medals, but he often wondered what became of them. He himself believed that many students were lost because in their early careers they were not taught how to express themselves outside the technical methods employed in the school. He contended that in the case of students who were preparing for the higher branches of art the study of form and colour and composition should be co-equal, and at the same time that the moment the student could draw he ought to be compelled to do composition. He contended that if a student was kept very much to one class of study it hampered him very much in after life. It was so in his own case. He remembered vividly the great difficulty he had, after going in a great deal for the antique, in taking to painting from life. The sketching classes ought to be regarded not as a mere offshoot of a school of art, but ought to be regarded as of as great value as the rest of the curriculum. In the Manchester Art School they had in Mr. Glazier an admirable master, and no doubt every possible advantage in carrying on their studies, but he did not see anything in the school applicable to landscape art. The consequence of its absence was that the students went out to nature without having learnt the executive ability of the landscape artist. He would like to see in that school—and the remark referred not merely to that school, but to all schools of art—two or three pictures, not necessarily large or expensive, illustrative of our great English school of landscape artists. He would like to see the Man-

chester School of Art doing something to revive the great art of landscape-painting, if that art could really be said to be dying, and he felt sure that towards this end there were gentlemen in Manchester who, if they were properly approached, would help them in the way of providing for the school some illustrations of English landscape art. He himself would be very glad to do something in the matter.

The St. Helens Library and Technical School Competition.

SIR,—Enclosed we forward you a copy of the whole of the particulars and correspondence relating to the competition for the St. Helens Library and Technical School, which has recently been given to the authors awarded the "second" premium by the assessor, although our design secured the "first" place.

We have carefully prepared a complete statement of the whole matter, including all letters, &c., and newspaper cuttings, which bear upon the subject, and intend sending a copy of the same to every architectural society in the kingdom which is allied to the Royal Institute.

The derogatory and far-reaching effect which such a grave miscarriage of justice must have, not only on ourselves personally, but the profession generally, cannot be adequately estimated, and we feel it our duty to give the utmost publicity and ventilation to the matter, and endeavour to make this a test case and see whether such questionable treatment can be perpetrated with impunity upon architects.

The Council of the Manchester Society of Architects are holding a meeting to fully consider what action to take in the matter, and either ourselves or the hon. secretary will advise you the result of same.

In order to further strengthen our professional claim and fitness to be entrusted with this work (after securing the first place), perhaps we ought to acquaint you that we are the architects for the following technical institutions, each having been obtained in "open" competition, and were adjudicated on by a professional assessor appointed by the committee:—Blackburn Technical School, Rochdale Technical School, Heywood Technical School, Widnes Technical School and Free Library and Winsford Technical School and Gymnasium, as well as being one of the firms chosen to periodically compete for the Manchester, Salford and Rochdale Board schools.

Feeling assured you will give us your fullest advocacy and support, we remain, dear sir, faithfully yours,

WOODHOUSE & WILLOUGHBY.

100 King Street, Manchester: January 16, 1894.

The documents sent us by our correspondents would make a large pamphlet, and we can only refer to a few of them. In the conditions for competition the committee undoubtedly reserve to themselves "the right to carry out any of the designs, whether premiated or not." After the announcement of the premiated designs the Town Clerk states that, according to the assessor, none of the three (in common with those unpremiated) can be carried out for less than 23,000*l.*, and before deciding "whether they will carry out any of the designs, and, if so, which," the committee will be glad to have any observations respecting the cost which the prize-winners may care to offer. An interview between Messrs. Woodhouse & Willoughby, Colonel Gamble and the committee followed, and the architects on October 27 say:—"As instructed, we will consider the most satisfactory method to reduce the expenditure." On December 20 the Town Clerk sends a cheque for 100*l.*, and states that the committee "have at length decided to have the works carried out by Messrs. Briggs & Wolstenholme." In mentioning the result some of the local papers stated that the decision was given after the committee had visited technical schools at Rochdale, Blackburn, &c. Messrs. Woodhouse & Willoughby, in reference to the statement, informed the committee on December 27 that, "To have it circulated in a public newspaper that the outcome of your inspection of our technical schools at Blackburn and Rochdale was to delegate the carrying-out of your work to the firm of architects placed 'second,' although it was well known that we were the architects of both the before-mentioned schools and that we were placed 'first' by the assessor for your structure, is most damaging and far-reaching in its effect, and also it gives us the right to require a full explanation and a sound reason why our design should be set aside in favour of one prepared by a firm who have had far less experience in the designing and equipment of structures of this kind than we have."

They also called Colonel Gamble's attention to the statement, who in his reply says, "I do not know who communicated the information to the papers, but I cannot conceive that it is in the slightest degree damaging to your professional reputation." On January 6, the Town Clerk writes to Messrs. Woodhouse & Willoughby:—"Not only were the conditions of competitions perfectly clear, that the committee were not bound to carry out any particular design, but this position was still further emphasised in my letter to you of October 12, asking you in common with the authors of the other premiated designs to submit amended plans, and yet again, at the interview which you had with the committee prior to the preparation of such amended plans, and further, to state that the committee are in no way responsible for anything that may have appeared in any newspapers. Under these circumstances, the committee consider that they are acting fully within their rights and are not in any sense required to give an explanation of their action."

"However, they desire me to say that they regret you should feel that their action implies a stigma on your professional status, as far from intending this the inquiries they have made with regard to your firm have been entirely satisfactory."

GENERAL.

An Exhibition is to be opened in Paris during the spring, of which the character is suggested by the title "Marie-Antoinette and Her Times."

The Royal Academy on Tuesday elected two more painters as Associates, viz. Mr. J. M. Swan and Mr. Arthur Hacker.

The French Exhibitors have presented a formal demand for compensation for their losses by the conflagration at the Chicago exhibition.

Three Builders were summoned on Tuesday by the Northwich Rural Sanitary Authority for constructing houses with windows that would not open at the top, in contravention of by-laws. As the windows were altered, a fine of 1*s.* in each case was inflicted, but the costs amounted to 24*l.* 13*s.* 6*d.* in all.

The Arts Committee of the Liverpool Corporation have nominated the following gentlemen to represent the Liverpool Academy on the hanging committee of the spring exhibition:—Messrs. James Barnes, R. E. Morrison, James Ireland and G. Hall Neale.

Mr. Alfred Darbyshire, architect (Darbyshire & Smith), has been elected a Fellow of the Society of Antiquaries.

The Surveyors' Institution will meet on Monday, the 22nd inst., when a discussion will take place on the paper read by Mr. E. J. Harper at the previous meeting, entitled "Trade Claims."

A Paper on "The Tunnels of the Dore and Chinley Railway," by the late Percy Rickard, will be read at the meeting of the Institution of Civil Engineers on Tuesday, the 23rd inst.

Mr. Archibald Macpherson, architect, Edinburgh, read a paper entitled "Theories of Architectural Proportion" at the meeting yesterday of the Dundee Institute of Architecture.

Mr. G. Sherrin has prepared plans for the new station of the Metropolitan Railway which is to be erected in Moorgate Street.

Mr. John Smalman Smith, chief justice of the colony of Lagos (and formerly the law correspondent of *The Architect*), has been gazetted to administer the government of that colony in the event of the absence of the Governor and of the Colonial Secretary.

Mr. James Wilson, C.E., engineer to the Greenock Water Trust, has resigned his place, as he is about to become a partner in the firm of Messrs. J. & A. Leslie & Reid, civil engineers, Edinburgh.

Mr. C. H. Crowther, of Huddersfield, the umpire in the arbitration between the Bradford Corporation and the trustees of Mr. R. Morrell, regarding certain land required in connection with the Westgate improvement, has made an award of 7,777*l.* The amount claimed was 10,400*l.*, while the Corporation assessed the value at 7,128*l.*

The Architectural Association Lyric Club has arranged to hold the second annual Cinderella Dance on Tuesday, the 23rd inst., at 7.30 P.M., at the Portman Rooms, W.

At the Meeting of the West of Scotland Iron and Steel Institute, Glasgow, the following papers were discussed:—Mr. E. J. Duff's "Electric Welding," Mr. E. H. Saniter's paper on "The Desulphurising of Iron and Steel," and Mr. John Barr's paper on "A Modification of Siemens's Gas Reversing Valve for Steel Furnaces."

The Architect.

THE WEEK.

MANY district surveyors appear to be anxious to satisfy the public about the advantage of a change in the system which will confer on salaried officials the carrying out of the Building Acts. Some of the cases which are heard in the law courts might be considered as inspired with that intention. One of the latest was *WALLEN v. LISTER*, which was heard on appeal before Mr. Justice HAWKINS and Mr. Justice LAWRENCE. It really involved the question of the permanent liability of a builder to pay fees and penalties in connection with one building. The penalties in the case only amounted to 7,300 $\frac{1}{2}$ %, but there was no reason why the amount should stop at that sum. On September 15, 1892, Mr. LISTER was served with a notice to perform certain work, and as it was not executed he was summoned. The magistrate's decision was not given until November 29, and it was to the effect that the prescribed works were to be carried out within six weeks. Meanwhile, the contract had been completed and the building handed over to the owner. But the builder was not considered to be free from his liabilities to the County Council. About five months afterwards he was summoned, and no less than eighty-six penalties were claimed. The summons was dismissed and the district surveyor thereupon appealed. Mr. Justice HAWKINS, in his judgment, discriminated so to speak between the office and the individual. He considered that a builder was somebody employed on a building, who came under the Building Acts as long as he was so employed; but when he ceased to be a builder, his liability as regards those Acts were at an end. It was necessary to obtain a magistrate's order to enforce a district surveyor's notice; but if the builder had no longer authority to enter on the premises, how could he be expected to obey that order? It would be tyrannical to punish a man for not doing impossibilities, and especially when the penalties amounted to 7,300 $\frac{1}{2}$ %. When the magistrate made the order he was not aware that the builder had completed his contract and therefore he exercised a wise discretion in refusing to enforce it or to impose penalties. In that view Mr. Justice LAWRENCE agreed and the appeal was dismissed with costs. The decision will compel district surveyors to be more prompt in sending in requisitions; but for those which may be necessary in the later stages of a contract, it is not easy to see how they can be made compulsory.

THE appointment of a dozen permanent inspectors for science is not to be accepted as an ordinary case of increasing the happy family forming the staff of the Science and Art Department. To some extent it is a revolutionary act which has startled the denizens of the comfortable "residences" at South Kensington from their composure. For years the Education Department, although ostensibly controlling South Kensington, has been able to exercise barely a nominal authority in that region. It has been supposed there was a power supporting the military and civil officials to which Whitehall was compelled to succumb. One of the consequences is that science and art, and with them the public interests, are sacrificed to the ease of a comparatively few gentlemen. Occasionally, outsiders were called in, such as artists and professors of science, and it was supposed they were to introduce a new and unofficial spirit into the Department. Care was, however, taken in their selection, and in a short time, as was anticipated, they were overcome by the spirit of routine. They became more circumlocutory and obstructive to new ideas than the permanent staff. Some of the larger towns have in consequence rebelled against the South Kensington system, to the wonder of the staff, who have never realised that the system was more than an affair for their own advantage. The failure of the teaching which is revealed by all the annual reports has at last compelled Whitehall to accept the risks of a contest with South Kensington. The twelve permanent inspectors, each of whom is to "take charge of a special

district and reside in one of the chief towns in their districts," are really Whitehall officials, who are to be constantly observing and reporting on the working of the South Kensington system. Their province will be science schools, but as the teaching of art is, if possible, in a more deplorable state, we suppose it will not be long before inspectors for art will also be appointed. The new officials have no easy task before them. The teachers of science do not appreciate the advantages of a system of inspection which is not intended to promote the ease of the humblest as well as the highest officials of the Science and Art Department, and for a time, at least, they are likely to be in a state of covert insurrection against the innovation. The inspectors will have chances enough to prove they are made of manlier and less pliable stuff than the majority of the examiners. If they will be firm in not allowing abuses to be cloaked, they may be assured the country will support them, whatever the risk.

THE proposal to erect baths at St. George's Pier-head, with a clock tower facing the Mersey, at a cost of 50,000 $\frac{1}{2}$ %, has been considered and approved by the finance and estate committee of the Liverpool Corporation. That the position was suitable was shown by the success of the existing small pier-head baths. They have an area of 1,255 square feet, and during last year were attended by no less than 58,657 bathers. In Cornwallis Street baths the number was 78,294, but the area is 4,641 square feet. In Stoble Street, with an area of 4,254 square feet, the number of bathers was 32,548. The water about the pier-head may not appear inviting to strangers, but it is found from analysis that it is not worse than is found in the majority of salt-water baths. It is not to be assumed that as the Mersey will be less needed for business purposes on account of the Ship Canal it is as well to utilise the river for bathing; on the contrary, the new buildings may be taken as evidence that many efforts will be made to increase the convenience of the port, and in that way to retain a hold on the trade of the world. It is also worth noting that the Conservators of the Mersey are endeavouring to prevent the throwing of chemical waste into the river, although it may not be offensive or injurious to the navigation.

THE competition for the transformation of the Pump Room in Bath appears to be at last determined. There were so many failures as to induce people to believe that the cause was something inherent in the system of competition. On Tuesday there was a meeting of the Town Council to consider the subject. It was, in the first place, proposed that the whole scheme should be reconsidered, in order to ascertain whether a less costly annexe would not serve all needs. That course was only approved on the understanding that Mr. WATERHOUSE, as assessor in the competition, and the author of the design to which he awarded first place, should have part in the deliberations. Diplomatic as was the proposal, there was only a majority of two in favour of it, the numbers being twenty-three against twenty-one. The figures will suggest the strength of the supporters of Major DAVIS's plans, which had gained second place. The third prize was awarded to Messrs. BAGGALLAY & BRISTOWE.

THE first of the "Monographs on Artistic Subjects," edited by Mr. P. G. HAMERTON, and issued from the office of the *Portfolio*, has "Rembrandt's Etchings" for a subject. About Mr. HAMERTON's competence to treat on any of the masters of etching there can be no question. In this case he has produced a guide for the student as well as for the amateur. The characteristics of the great artist's works, which are veritable gems, are explained with rare judgment. The modern processes of reproduction have enabled the publishers to give facsimiles of the most dainty as well as the most grave examples of REMBRANDT's etchings. The monograph costs only half a crown, and is therefore obtainable by students who are not wealthy.

LAMBOURN CHURCH.*

THE world having become weary of the grand histories in which kings and ministers strutted, there is at last a chance for village chronicles. In England and America they are especially appreciated, first, because it is interesting to have a peep at ordinary life in a remote age, and secondly, because men and women who do not possess family histories are glad to be assured that at least their surnames are not new creations. If CHRISTOPHER SLY, tinker, in his most besotted condition could feel a pride in the conviction that it was only necessary to look in the chronicles to discover how his family came in with "RICHARD CONQUEROR," why should a modern millionaire be denied the satisfaction of feeling that he also must have had ancestors? Accordingly the old county histories in folio have become the costliest of books, and a vast number of histories of small places on a big scale are prepared in order to supplement or supplant them.

The history of Lambourn Church is a creditable specimen. The author intended to have the whole Hundred of Lambourn for his theme. He found, however, there was a superabundance of materials. Accordingly, he resolved to publish a volume on Lambourn Church, which is to be followed by others on the manorial history of Lambourn and on the church and landowners of East Garston. If the world behaves well it may also be enriched "by the publication, in two or more volumes, of a complete transcript of the church registers of the two parishes, with notes." All over England the same industry is exhibited, and such is the appetite for ancient news, people are not satisfied with the available stores, for laments are heard about the destruction of records owing to the carelessness of the clergy and their clerks. As the life of man is on the average threescore and ten years, it is not easy to see how anyone can find time to do more than barely keep himself informed about English history as it appears under the new microscopic treatment. The demands of one's own age must be sternly renounced.

Lambourn, for instance, is not associated with any event that at one time would be considered as memorable. Its inhabitants were not famous, and happily not one appears to have gained temporary notoriety by a crime. We went on steadfastly through the lists and pages, in the hope that before we arrived at the finish our old acquaintance, the roystering MICHAEL LAMBOURNE, would in some way be associated with the Hundred. But the gallant cavalier who, by his own account, behaved so bravely at the siege of Venlo, and was thanked by Graf MAURICE at the head of the army, was a native of Cumnor, as could be testified by Goodman THONG, the bailiff. Now the Black Bear at Cumnor, where LAMBOURNE officiated, is about five-and-twenty miles from the George at Lambourn, and the honest agriculturists who met at the latter would probably desire to keep the redoubtable "Mike" at a still greater distance. As elsewhere in Berkshire, the craving for adventures in the Netherlands, Spain and the New World, which he could not resist, may have been felt in Lambourn; but, so far as is known, the inhabitants were all of the stay-at-home species. They seemed to be almost rooted to the soil, and Dr. PRIMROSE might have had them in his mind when he wrote about fireside adventures and migrations from the blue bed to the brown.

Lambourn was not peculiar. In the greater part of England life was an humdrum and commonplace affair during centuries, and on that account the people were likely to be happier than if they had lived in shires which were more susceptible to exciting influences. They were not without history. Mr. FOOTMAN combines the twelfth and thirteenth centuries in one chapter, but he is able to have a separate chapter for each century afterwards down to our time. There are records relating to a still earlier period. The events are not, of course, very startling, but even a small-beer chronicle can have interest for honest folks who care little about wine.

The earliest mention of Lambourn in a legal document occurs in ALFRED's will. The king declares that he gives to his wife "the home at Lambourn, and Wantage and Edington." There is also a reference to the place in one

of the St. Paul's Chapter-house Books, in which the rights or tithes which belonged to the Minster of Lambourn are described as warranted by a charter of CANUTE the Dane, and there is a curse invoked on all who would meddle with them. Subsequently CANUTE himself would appear to be liable, for he made over church and tithes to the Dean of St. Paul's. Thus began, says Mr. FOOTMAN, "a connection which was not to be severed for eight centuries, and which, though it has given to Lambourn a succession of titular rectors unequalled among English clergy, below episcopal rank, in fame, learning and piety, has yet proved by no means an unmixed blessing to the parishioners and church of Lambourn." In 1892 the tithes (which in the thirteenth century were of the value of 53*l.*) amounted to 1,254*l.*—a large sum to be mainly expended outside the parish.

Lambourn was an established parish in ALFRED and CANUTE's time, and its ecclesiastical establishment is therefore much older. It may be supposed to date from the origin of Christianity in the island, but the evidence can only be taken as probable. Nothing is known about the early churches. No part of the existing building appears to be older than the twelfth century. As survivals of that time are the outer walls, the bays of the nave, the clerestory windows and a small circular window in the west gable. There is also work of the succeeding centuries which is carefully described in the book, but, says Mr. FOOTMAN, "later alterations and additions have entirely transformed the appearance of the transepts and chancel, and the nineteenth century has ruthlessly destroyed the ancient roofs."

The late Mr. STREET would appear to be among the restorers who transformed the building. When describing the restoration of the chancel which he directed in 1861, the author says:—"The work as a whole is distinctly inferior to what we might have expected from an architect of such eminence. However desirable it may have been from an artistic point of view to elevate the external pitch of the roof, it surely could not have been necessary to replace the old oak ceiling within by the very uninteresting pinework which we see now; and even from the outside Mr. STREET's green slates, surmounted by ugly red-crested tiling, are scarcely an improvement upon the low-pitched roofs of the fifteenth century."

To architects one of the most interesting incidents in the history of the restoration of the church will be the employment of the late Professor DONALDSON in 1847 as reporter. His name is not commonly associated with such work, but he appears to have exercised admirable discretion in his recommendations. In one of his reports he says:—"The plastered ceiling of the nave should be removed entirely away, restoring to view the noble timbering of the roof, which will be a very handsome object, well worthy of the church, and in accordance with its original intention." When the plaster was removed it was found that dry-rot had invaded the timbers. With care it would have been possible to save the greater part of the timber-work. The sound oak pieces were, however, sold, and with the money a commonplace plaster roof was substituted, for which we hope the Professor was not responsible. Mr. BURY and Sir GILBERT SCOTT were also associated with the restoration.

Some peculiarities are found in the church. There are, for instance, two clerestory windows over the three eastern arches of the nave, and only one over the western. There is also a piscina "on the south side of the western arch, 13 feet from the ground; which shows that when the rood-screen was erected in the fourteenth or fifteenth century an altar must have been placed upon it."

Remote as was Lambourn, it was one of the districts that were coveted by the Norman invaders. Mr. FOOTMAN says that "when the Domesday Survey was taken, not one of the ancient landowners in the Hundred retained their property." The proprietors, at all times, appear to have wrung as much as was possible out of the people, for there are indications that Lambourn was always in a state of poverty. According to one inquisition, made in the fourteenth century, about seven hundred acres of land, which used to be ploughed and sown, were entirely uncultivated by reason of the poverty of the parishioners. A curious indication of poverty is also found in a letter from the Bishop of SALISBURY in 1380, ordering that the sentence

* *History of the Parish Church of Saint Michael and All Angels, Chipping Lambourn.* By John Footman, M.A. (Elliot Stock.)

of the greater excommunication should be pronounced in Lambourn Church, with all accustomed solemnity, against some unknown poachers, or "sons of iniquity," who had captured rabbits and other game on his lordship's warren.

Almshouses for five poor men existed in Lambourn before the fifteenth century, but how long is not known. There was a priest attached to the charity. The earliest notice of them is found in the will of JOHN ROGERS, who was sheriff in 1446. In it he says:—"I will that the priest have every year of ready money, at four times in the year, nine shillings and four pence, and every poor man eight pence in money every week to be paid; and fuel competent for the priest and for the said poor men to be had of Chiselden's Woods, and that the whole wood to serve only therefor; and that the priest have every third year three yards of Bruton russet, price 40d. the yard, and every poor man at the same time three yards of the same colour, price two shillings and six pence the yard." In 1501 JOHN ESTBURY obtained a license from HENRY VII. to found a chantry and an almshouse for ten poor men, which still exists. The chantry occupies the angle made by the south transept and St. Mary's Chapel in the parish church. The almsmen keep up the practice of praying at the tomb of the founder, and thus it happens that "Lambourn is one of the few parish churches in England where daily service has been held from the earliest times until the present day."

It is remarkable that in a place so quiet enough materials should be found for the preparation of a volume. The changes which took place in the State rarely altered the even tenour of men's ways in Lambourn. Fox, the martyrologist, with all his research, could not discover one Lambourn case which would increase the horrors in his work. Yet there is no doubt that Mr. FOOTMAN'S ability has built up a book which may be accepted as a characteristic description of English life in quiet districts, and as such it is a valuable contribution to archæological literature.

THE ROYAL ACADEMY.

ON Tuesday Sir Evelyn Wood, V.C., as acting Prime Warden, presided at a livery dinner of the Fishmongers' Company, at which several members of the Royal Academy and other artists were present.

The Prime Warden, in proposing "The Royal Academy of Arts," said that the President, who would respond to the toast, was one of the most conscientious workers of all the members of that illustrious body. It was during the Crimean war that Sir F. Leighton had made his first great essay in *Hector's Widow and her Child*, a picture which no soldier who had seen it could ever forget. In his own profession the artists had borne a noble part, and his own son, who was now in the army, had been a member of the Artists' Volunteer Corps. The Artists' Corps stood among the first of our Volunteer regiments.

Sir F. Leighton, in acknowledgment, said:—Mr. Prime Warden, my lords and gentlemen,—I hope I shall be pardoned if, before addressing myself to the subject of the toast, I express my regret that the present Prime Warden is prevented by an accident from dispensing the magnificent hospitality of the Fishmongers' Company. At the same time we cannot but congratulate ourselves that he has found so admirable a representative in the acting Prime Warden. I thank you, on behalf of the great institution of which it is my pride to be the chief servant, most sincerely for the cordial and graceful terms in which you have been pleased to invite your guests to drink to its prosperity; and to those distinguished guests our gratitude is no less due for the appreciative warmth with which they have received those words. For myself I am indeed aware that I am in this toast an official and unavoidable appendage; nevertheless, I cannot but warmly thank you for the friendly and flattering manner in which you have alluded to me personally; and, sir, since thanks are on my lips, let me before I go further acknowledge the aid I have received from this Company in the promotion of a work which has enlisted my deepest interest for some time past, namely, the removal to a fitter and worthier site, by the authority and with the aid of the Dean and Chapter of St. Paul's, and under the zealous supervision of the distinguished man in charge of the cathedral, Mr. Penrose, of the noblest monumental work that has ever issued from the brain and hands of an English sculptor—I mean the monument to the great Duke of Wellington by Alfred Stevens. This act of reparation has only been made possible by the pecuniary aid of public-spirited persons and bodies, and amongst those bodies the name of the Fishmongers' Company is not wanting. Let me add that in this matter I have been prompted, not only by the impulse to

honour the work of a supreme artist, but also by a warm desire to bear my part, directly or indirectly, in the artistic enhancement and adornment of this greatest and wealthiest, but, alas! not the comeliest of the cities of the world. It is an agreeable task to me to acknowledge a toast conveying appreciation of the work done by and the spirit that animates the body I here represent, for I believe that appreciation to be deserved. Now, in judging that work it is necessary to bear in mind what the function of such an institution is, and what it is not. It is not the attribute of any school to impart genius, or that lesser thing, talent—these are divine gifts that do not lie in the hands of men; to a school it belongs to train and strengthen the gifts which nature bestows on those who come within its control, to put into their young hands the weapon of knowledge, and to give guidance to faculties which it cannot impart. And this our schools lay claim to do in a broad and liberal spirit, bringing the young artists who frequent them into contact with various modes of thought and methods of work in the persons of a succession of teachers representing the different personal tendencies which, in their manifold variety, make art so interesting. And this variety among its teachers the Academy seeks to obtain by the exercise of a wise and large-hearted catholicity in the choice of those whom in each successive year it gathers into its brotherhood, so that there is hardly a single direction in which the art of our country expands itself in its freedom which is not represented in the Academic body. It is easy to taunt such a school by saying that it does not enshrine and hand down a definite body of traditions, which means a number of rigid and inelastic maxims. It does, I think, a better and a wiser thing, for whilst upholding by means of exhibitions the knowledge of and reverence for the great masterpieces of the art of the past, it strives to represent within itself and to embrace within its scope the living actual art life of the country. In this way, and in this way alone, can it be hoped to foster new and wholesome growths on the great golden tree of art. To contribute to this end is a noble function; it is one in which I claim that the Royal Academy takes a prominent and honourable part, and I see a recognition of the justice of this claim in the toast for which I have now again the honour to thank you.

DUNDEE INSTITUTE OF ARCHITECTURE.

AT the first ordinary meeting of the session of Dundee Institute of Architecture, Science and Art, Mr. Wm. Mackison presided. A remit was made to the Council to consider the relationship in which the Institute and kindred associations in the city stand to each other, with the view of discovering whether it would be of advantage to move in the direction of co-operation. Mr. W. Ryle Smith, Broughty Ferry, was elected a member, and Mr. Alex. Laburn, Dundee, an associate of the Institute. The Chairman stated that an opportunity would be taken of inviting the members to inspect the Dundee Electric Lighting Station, which, he said, was in a most complete state and well worthy of inspection, and over which the engineer, Mr. Brownlee, had kindly expressed his willingness to show those connected with the society. It was further mentioned that if desired a visit to the gas works might be undertaken, and the Council was appointed to make arrangements therefor. The lecture of the evening was delivered by Mr. Archibald Macpherson, architect, Edinburgh, who spoke on "Theories of Architectural Proportion," illustrated by drawings and views shown by limelight. In the course of his lecture Mr. Macpherson adverted to the rage which prevailed among certain theorists about sixty years ago to discover some geometrical principle in the proportions of ancient buildings. Among the theories thus dealt with was that of Viollet-le-Duc, which was based on the equilateral triangle, and a number of the illustrations exhibited agreed with this idea to a remarkable extent. The same theory was applied to a number of Scottish buildings, and in this connection there were shown a series of beautiful views of Dunblane Cathedral, which were specially interesting to those present in view of the proposed visit of the members of the Institute to the ancient edifice in the early summer. In conclusion, the lecturer remarked that if the principle that he had referred to were followed out to the extreme logical conclusion, the designing of a noble church would be reduced to the level of the solution of a geometrical puzzle, and no series of geometrical ratios could ever take the place of the cultured mind and the trained eye of a true artist. On the motion of the Chairman, Mr. Macpherson was cordially thanked for his lecture.

A Gift of 150l. has been received by Mr. John Macleod, hon. treasurer of the Association for the Promotion of Art and Music in Glasgow, from the United Co-operative Baking Society, Limited, in aid of the fund for the erection of the Art Galleries, Museum and School of Art at Kelvingrove.

THE INSTITUTE PRIZES.

THE following review of work of the travelling students, 1893, and of that submitted for prizes and studentships, 1894, was read by Mr. Alexander Graham, F.S.A., at the meeting on the 15th inst. :—

It has been the custom in recent years to depute some member of the controlling body of the Institute to prepare a series of critical notes upon work submitted annually in competition for the prizes and studentships, and to embody such notes in the form of a short paper to be read at an early meeting of the new year. It is a privilege for any one to take part in such a proceeding, and it is my pleasing duty on this occasion to record the sense of gratification with which the Council have viewed the many beautiful drawings that now adorn the walls of the gallery. It may seem an invidious task to play the part of a critic in any matters on which there is obviously divergence of opinion; but criticism in this room is intended for friendly hearers, and the motive of such criticism is solely for the encouragement of our younger brethren, to lend a guiding hand to those who are on the threshold of their career, and to promote that which is common ground for us all—the advancement of architecture.

The work under consideration may be classed as follows :—

1. Measured drawings and sketches; 2. Original designs;
3. Literary work in the form of essays; 4. The work of the travelling students of last year.

Measured Drawings and Sketches.

It is a matter of regret that the Institute medal given for so important a branch of study as measured work should have attracted only two competitors, whereas the Pugin studentship, which, it must be admitted, offers an almost unlimited field for the experienced sketcher, has enlisted the artistic services of six candidates of more than average ability. The reason for this is apparent. Sketching is a fascinating pastime for any one who can use a pencil or a brush with ordinary facility. It enables one to exhibit at a friendly gathering a pleasing record of a well-spent holiday, it forms material for a pretty volume for the drawing-room table; and whereas geometric line drawings, devoid of pictorial effect, appeal only to professional judgment, sketches in any form are intelligible to the non-professional mind, whether male or female. But pretty sketches, simply as little pictures, have no practical value, nor will they help an architect in his daily practice. A few careful measurements of any portion of a well-designed building, showing the size and jointing of the masonry, as well as its scale and surroundings, committed to paper on plan, section and elevation, will prove more instructive and more useful than whole sheets of pictorial bits which may have attracted the eye at the passing moment. This truism has been so often propounded in this room as almost to require an apology for repeating it. Let us hope that pegging away in a good cause will ultimately have a beneficial effect.

As drawings of measured work nothing can be better than those of the north transept of Lincoln Cathedral, submitted by Mr. James R. Wigfull [A.] ("Saint Hugh"), to whom the medal has been awarded. Lincoln, with its charms of line and form and proportion, is always attractive to the student as well as to the advanced architect, and although nearly every part of the structure which is worth sketching or measuring has been committed to paper in recent years, such drawings as these are very welcome as a valuable contribution to the portfolios of the Institute. They are exactly what measured drawings should be: clear, precise, full of meaning and without any attempt to produce pictorial or meretricious effect. The other competitor, with the motto "Universum Studium Meum," selected one of the subjects suggested in the annual programme, viz. the tomb of Henry III. at Westminster. The drawings have not failed for want of merit, but on account of the greater merit of the Lincoln drawings. The monument, which is interesting from an antiquarian point of view, has been very carefully delineated.

And here I would venture to suggest that measured drawings for which prizes have been awarded should be turned to more useful account than has hitherto been the custom. For nearly fifty years the holders of the Silver Medal have deposited in our library a copy or reproduction of their drawings, and consequently there is a mass of useful material stowed away which is certainly accessible, but not easily so. These reproductions, it must be remembered, are careful delineations, line for line, of a large number of monumental buildings, many of which have been restored or disfigured in recent years, or in some cases have perished altogether. Would it not be as well therefore to classify this good material, and to adopt for the future some uniform system of reproduction? Such reproductions could be obtained at small cost; they should be of fair size, and should be bound up in volumes from time to time. As matter for study or reference they would be invaluable, and I venture to think the scheme would not prove unremunerative to the Institute from a financial point of view. Moreover, it would be an encouragement to younger men, who would thus

become contributors to a work of exceptional and lasting interest.

The large number of sketches submitted by six competitors for the Pugin studentship is a clear indication that there is no lack of energy in the rising generation, and that the power of sketching with facility is spreading rapidly through our ranks. It is impossible, however, in this necessarily brief notice to do justice to the merits of so many aspirants to distinction in this branch of manipulative art. Mr. R. Shekleton Balfour [A.], whose measured drawings of Heriot's Hospital gained the Institute medal in 1892, has been successful in carrying off this studentship, and, we may add, has well deserved it for his admirable series of sketches in pencil and colour. Such good work as Ethelreda's Shrine at Ely, the series of drawings of the charming old bede-houses at Higham Ferrers and Lyddington, and that interesting specimen of Early Italian art, the tomb of Benedict XI. at Perugia, are quite up to the mark. A word must be said for the excellent sketches of Mr. J. Paul Cooper, principally illustrative of Gothic architecture in Italy. It is a question whether such sketches, admirable though they be, are admissible for a prize awarded "for the promotion of the study of the Mediæval architecture of Great Britain and Ireland." The founder of this studentship was one of those men who regarded the duties and responsibilities of life, as well as everything he undertook, with exceptional gravity. There is little doubt that so earnest a thinker and so diligent a student of Mediæval work in this country was actuated by a desire that others should follow in his steps and perpetuate the good work in which he himself achieved such marked success. It would be as well, therefore, if candidates paid reasonable regard to the intentions of the founder, confining their attentions more especially to remains of Mediæval buildings at home rather than abroad.

These remarks are in some way applicable to Mr. W. Curtis Green's careful drawings of Ye Old Oak House, West Bromwich, which might be classed as Mediæval, though some of the details give indications of work of later date. Portions of Gloucester Cathedral have proved attractive to Mr. Alfred J. Dunn, who has given a sheet of interesting drawings of the wax paintings on the reredos in the lady chapel. But the pencil drawings are not all equally satisfactory, partly owing to want of precision, and partly to the adoption of drawing discontinued lines. This style of draughtsmanship is not to be commended, and should not be encouraged. For the second time Mr. Thomas A. Sladdin has unsuccessfully entered the lists with some excellent, conscientious work, such as the details of Fox's Chantry at Winchester, and Mr. H. C. Corlette [A.] gives some measured drawings of St. Anastasia at Verona, together with some beautifully-coloured sketches of the ornament in the vaulted ceiling of that noble church. A medal of merit has been deservedly awarded for such excellent work. These coloured sketches should be specially noticed, because they will give future candidates for the Owen-Jones studentship some idea of the class of colour-work which the Institute desires to encourage, and which would have obtained favour with the distinguished founder of that prize.

No award has been made this year in the Owen-Jones studentship, on the ground that neither of the two candidates had attained that standard of excellence which had been maintained in previous years. Mr. A. T. Bolton's contributions were considered insufficient, and those submitted by Mr. T. Rogers Kitsell, the Tite prizeman for 1892, did not altogether satisfy the judges, in spite of the merit conspicuous in many of them, such as the series illustrative of textile fabrics in the South Kensington Museum.

Original Designs.

The subject selected for competition for the Soane medallion has brought ten candidates into the field with a large number of designs of varying merit. This much-coveted prize has been awarded to Mr. James Humphreys Tonge ("Nil Desperandum") for a clever picturesque design and for a fairly workable plan. But it is puzzling to know what could have induced so capable a designer to carry cross walls right through the centres of a series of bay-windows. This occurs in no less than twelve places. These bays, which are conspicuous features in the quadrangle, are designed externally as one window, and not as two separate windows. Another defect in the planning is the position of the water-closets, which are grouped together close to the main entrance gateway and are accessible only by passing in front of a sitting-room window. The conditions of the competition included the placing of these conveniences in a detached block. In its strictest sense this means a detached and isolated building, but the framers of these conditions may have meant that they were to be kept together as much as possible. Anyhow, this somewhat inelastic condition has proved difficult of solution, and though each competitor has tackled the subject in his own way, it cannot be said that the efforts of any one of them have been attended with marked success. It may be some consolation to Mr. R. S. Dodds [A.], the author of "Quien Sabe," to know that his general design

found almost as much favour with the judges as the one placed first. Its quiet collegiate character, the marked exercise of restraint in the treatment of wall-surfaces, and the excellent proportions of the gateway-tower are the most noticeable part of the design. Perhaps it would have been as well to have broken the long line of frontage of the inner quadrangle by a bay or projection or by a different treatment of skyline, but it is difficult to judge of the pictorial effect from one perspective, which is isometrical. Here, again, the condition as to the detached block has been met by placing the water-closets at the extreme end, and so far removed from one part of the building that some of the occupants would have to traverse a distance of about a thousand feet in one journey there and back. This cannot be considered convenient. In other respects, assuming that such a site could be obtained for a building with a depth of about 400 feet, behind which is the college garden and beyond is the master's residence, the arrangements shown on the plan are workable. The hall and kitchen offices are rightly placed, and the position of the Fellows' common-room has been well considered. A medal of merit has been awarded to Mr. G. S. Hill ("White Star") for a picturesque group of buildings in brick and stone, drawn by a skilled hand. As a composition it would have gained by less elaboration and by the exercise of a little restraint in the treatment of the wall surface. The single rooms for students, with space for a bed and with one angle screened off to form a pantry, scarcely comply with the instructions, but the positions of the water-closets in octagonal blocks, with access from a corridor, may be said to meet the written requirements. For an excellent set of drawings and details submitted by Mr. Henry Mitchell ("Black Lion") honourable mention has been deservedly made. As a matter of criticism it may be asked what purposes are served by the two towers, except for external effect, and whether convenience was considered in making the dining-hall so very lofty. It should be observed that the pantries are without light or ventilation, although there would have been no difficulty in obtaining a sufficiency of light through narrow windows in the external wall; and as an attempted solution of the problem of the water-closets already referred to, they are placed off the staircases somewhat after the manner now generally adopted in hospital construction. To meet this arrangement, which is not inconvenient, the corridor or cloister below is blocked with supporting piers, completely sacrificing the charming effect always produced by the long unbroken lines of a well-proportioned and adequately-lighted gallery or corridor. All the other competitors have attacked the subject in different ways, but with doubtful success. Planning is an art that with some men is almost a gift, while by others it is attainable only after long practice and as the result of much experience. Wasted space, in the form of loggias, pantries without light, staircases lighted solely by skylights, and water-closets in a central block forming a conspicuous feature on entering the college gateway, are a few instances of defective planning noticeable in many of these designs.

The style of architecture adopted by the competitors is much on the same lines, with the exception of one who has given a design of Jacobean character. The nature of the subject was necessarily restricted in respect of style. Indeed, it may be said that the style of collegiate buildings in a university town in England is almost traditional, although these traditions have been set aside on many occasions, markedly in recent years. Still it could hardly be expected that so severe a type of Classic architecture as was in vogue when Soane, the founder of this medallion, practised with such distinguished success, nor even the lighter forms of the Renaissance, which prevail in the chief cities of Italy and Spain, would have found favour in this competition. If any of the candidates had adopted such styles, it is highly probable that his labours would have been in vain. May we not, therefore, assume that the subject precluded a number of able men from taking part in the contest—men whose studies had been more particularly directed to the various styles of Classic architecture? and may we not hope that, in future years, the subject selected will be one that readily admits of every kind of treatment, and with some prospect of success? I am led to make this remark in consequence of having frequently observed how much independent thought is noticeable in the original designs prepared for the examination qualifying for candidature as Associate. It is true that many of these designs are not of a very high order, but they show the tendency of our rising school, and in that respect the movement deserves encouragement.

The Tite prize has only attracted four competitors. One would have thought so fascinating a subject as a Royal Mausoleum, to be treated according to the principles of Palladio, Vignola, Inigo Jones or Wren, would have brought a larger number of candidates into the field. No one of the designs has attained such excellence as to evoke unqualified admiration, the merit lying almost as much in the plan as in any special skill in architectural composition. The prize has been awarded to Mr. A. R. Hennell ("Semper vigilans") for a

simple design after the manner of Palladio. The plan is meritorious, and the internal effect of the four bays with their domical roofs could not fail to be pleasing. No construction is shown, nor is it asked for, but it is presumed that the cupola, which is only 22 feet in diameter, rests upon girders over the gallery front. The external effect would have been better if the cupola had been about 2 feet larger; the only difference that it would have made internally would have been the reduction in the width of the gallery, but this would have been of no consequence. It is difficult to understand why the author of so creditable a design should have gone out of his way to break the pediment over the entrance doorway. Such a treatment is not to be commended. In the present instance, if the raking lines had been continued to the apex, and heraldic or other sculpture introduced in the tympanum, the building itself would have gained considerably in breadth as well as in general effect. The perspective drawing does scant justice to the design, and it is fortunate for the author that the merits of the composition and not the perspective had full weight with the adjudicating committee. The design bearing the device of a red cross is picturesque, but the architecture does not belong to any particular school. The general conception of the plan is meritorious, but it is doubtful whether an arrangement applicable to so large a building as the *Invaides* is suitable for an edifice of such very moderate dimensions. The staircase block, which has been made a conspicuous feature of the design, would not have a pleasing effect from many points of view, and the inner angle formed by the junction of the two blocks, one being circular and the other square, would require much more consideration than the author appears to have given to it. Another design, contributed by "Wren," deserves notice as a study of the works of Wren. But the proportions are not those of the great master. The cupola is but a transcript on a small scale of the dome of St. Paul's, without the lantern; and the portico, which might have been made an effective feature in the composition, if proportions had been studied, detracts from rather than contributes to the general effect. It is a matter of surprise that none of the candidates were inspired by Bramante's charming little circular chapel of San Pietro in Montorio, which seems to lend itself to such a subject as a royal mausoleum. It possesses many of the characteristics of the school of Vignola; and, for subtle proportions, balance of parts and pleasing outline has not been surpassed by any other work of its kind.

For the Grissell medal there is only one competitor. This is a matter of regret, for the subject, a timber dome with a lantern, is within the scope of any man who has had a moderate share of practical experience. The result is not altogether satisfactory, for the drawings exhibited are incomplete in themselves, and the subject, although commenced on right lines, has evidently not been fully worked out. It is hoped that the same subject, or a similar one, will be given again, and that the author of this design will not be discouraged, but exercise his powers again with more fortunate results.

Literary Work in the Form of Essays.

We now turn to the literature of the year in the form of ten essays of varying merit on "The Treatment of Sculpture in its Relation to Architecture." On three occasions during the last ten years this medal has not been awarded, once in consequence of no essays having been received, and twice owing to the work submitted having failed to satisfy the examiners. Last year was a case in point, when an experiment was made to test the literary powers of the rising men amongst us. The subject was a difficult one, and appealed especially to men of considerable culture and of high literary attainments. The result was unsatisfactory. This year the subject may be regarded as an easy one, evidenced by the fact that ten candidates entered the list for this honourable prize. After careful examination and studious perusal of an unusually large amount of manuscript and type-writing, the adjudicating committee decided in favour of the one bearing the device of a crown and thistle. The author of this essay is Mr. John Begg [A]. Medals of merit have been awarded to Mr. C. Bernard Hutchinson [A.] ("Nemo Repente") and Mr. Walter K. Shirley ("The Godhead Fires"), and honourable mention has been accorded to Mr. Percy Charles Campbell ("Pandrosus"). And here I should like to say a few words in friendly criticism upon the general character of these essays, not only those on the table before us, but on those submitted in competition in previous years. Essay-writing is a gift allotted to the few. To some it comes in earlier years by intuition, to others the facility is often attained by long course of study and diligent perusal of the few authors whose distinguished names are associated with this branch of literature. It is only on very rare occasions that a high standard of excellence, both in the material as well as in the composition, can be reached, and that standard has not, in the opinion of those who have read these essays, been attained in this last competition. There seems to be an idea, as exemplified in so many instances, that illustrations, mostly in the form of photographs, are the backbone of the composition, and that so

many pages of descriptive matter, supplemented by a few comments, constitute an essay. Without any desire to undervalue the zeal and untiring labour that has been shown in any marked degree by so many competitors, or to discourage in any way the aspirations of those who will take part in this competition in the near future, I would only venture to suggest the study of the pages of some of our great essay-writers, and learn from them the form and method adopted in building up their work, as it were, from the starting-point.

The Work of the Travelling Students, 1893.

We will now briefly consider the work of the travelling students of last year, noting, in the first place, the valuable labours of Mr. Banister F. Fletcher [A], the holder of the Godwin bursary. As a practical study of a notable group of temporary buildings, the handsome well-illustrated volume before us, entitled "Report on the Columbian Exposition at Chicago, 1893," will take honourable rank as a work of reference. Many of the illustrations are familiar, but special attention should be directed to those relating to iron roofs of large span. They are clearly defined and will prove valuable to those whose practice demands an intimate knowledge of this branch of architectural construction.

It is always gratifying to note the work submitted by prizemen of a previous year, and it is rarely disappointing either in quality or quantity. Men who have passed with distinction the ordeal of a first exhibition of their powers are not likely to fail in the expectation of their brethren, nor is the enthusiasm that prompted them to enter the lists likely to flag when the first steps are taken in a career of usefulness and honour. It cannot be said that any one of the prizemen of last year has failed in any particular. We therefore welcome them once more with a note of congratulation for so much good work well done. Mr. Arthur J. Bolton [A], the Soane medallist, has returned with some charming sketches and measured drawings of buildings in Spain. Nothing could be better than the pencil drawing of areja at Burgos and another of the stone lantern of the Giralda at Seville. We will pardon the omission of the terminal figure, which is probably inaccessible, but fully appreciate the labour and inconvenience in measuring the work shown on the drawing. Then we have a careful elevation of the Cathedral tower at Granada and, amongst others of equal excellence, details of the cloister of the Collegio Irlandeses at Salamanca—a good specimen of Spanish work. The drawings sent by Mr. John J. Joass, the Pugin student, will compare favourably with the work of his predecessors. Attracted especially by the buildings of his native land, Mr. Joass has given a series of drawings of great interest. The drawing of a cabinet at Holyrood is deserving of notice, and so are those illustrating Craigevar Castle. It is a question whether such a building can be classed as Mediæval in the sense in which the founder of this studentship would have interpreted it. Mr. Charles A. Nicholson, the Tite prizeman, has brought a series of beautiful drawings in pencil and colour, the result of a tour in Italy. The view of St. Maria dei Miracoli is quite up to the mark, and the fine perspective interior of St. Anastasia at Verona is specially noticeable. Taking this drawing as a companion to Mr. Corlette's details of the ornament, already referred to, we obtain an excellent idea of the form and colour of this noble church. Mr. Alfred H. Powell, the Owen-Jones student, exhibited such marked appreciation of colour in the drawings submitted last year, as well as a high order of draughtsmanship, that it seems unnecessary to say that the standard of excellence, shown by a series of beautiful drawings, has been fully sustained. A glance at the screen on which they are exhibited will more than satisfy the good opinion previously expressed of Mr. Powell's artistic work.

These, gentlemen, are the somewhat imperfect notes on the students' work of the year, penned in good faith, and with the sole desire to encourage, and not to dishearten, our younger brethren in their onward career. I will conclude with a caution—not to devote too much time to the production of sketches, simply as little pictures. Draughtsmanship, after all that can be said in its favour, is but the handmaid of architecture, and sketching is a pleasant means to a nobler end. Some of the greatest works of mankind were erected in an age when draughtsmanship, as we understand it, was utterly unknown. It is in the application of what we see and sketch that the true test of our abilities as architects is to be found.

The meeting terminated with a vote of thanks proposed by the President to Mr. Graham; with a vote of thanks also to the President, which was proposed by Mr. R. Phené Spiers.

Messrs. Oliver & Leeson, architects, on Saturday afternoon conducted the members of the Northern Architectural Society through the Chillingham Road Board Schools, Newcastle, for the purpose of examining the "Plenum system" of heating and ventilation.

ARCHITECT'S FEES.

AN action was heard at the Bradford County Court before Judge Gates, Q.C., and a jury, in which Mr. Frederick S. Smith, architect and surveyor, of Ilkley, sought to recover the sum of 37*l.* from James Lund, of Ilkley, being the balance of an account for services rendered. The original claim was 47*l.*, of which sum 10*l.* had been paid by the defendant. The defendant also paid the sum of 13*l.* 11*s.* 6*d.* into court. The case for the plaintiff was that the defendant was the owner of six semi-detached houses in Beanland's Parade, Ilkley, for which he paid about 220*l.* per house, but which originally cost the Victoria Land Company about 400*l.* each, without land and drainage. The six houses were in three blocks, and the defendant decided to build in the two spaces between, so as to form a terrace. He consulted the plaintiff on the matter, and plans were prepared. The defendant also wanted cellars to be made under the new houses, which cellars were to be used by the inhabitants of the already-existing houses, and the designs had also to show the ridges of the roofs of the old houses raised above the roofs of the others. The defendant asked plaintiff what his charges would be, and the plaintiff said they would be 4 per cent. on the total outlay. If the building and alterations were not proceeded with he would charge for work done in the usual way. The plaintiff drew plans, but the Local Board declined to pass them on account of the peculiarity of the arrangement of the cellaring. They also wished to keep the open spaces vacant, and said that building on them was a breach of the covenant. The defendant consulted his solicitors, and ultimately the plans were, with certain modifications, passed by the Ilkley Local Board. This, however, necessitated fresh plans being prepared by the plaintiff and also some additional work. The lowest tender for the four houses was 1,225*l.* On this the defendant said that he could not build at that cost. The plaintiff thereupon made various reductions to bring the cost down to about 700*l.*, but the defendant abandoned the work. The plaintiff's claim was made up as follows:—Two per cent. on the estimate of 1,225*l.*, 24*l.* 10*s.*; extra plans, 3*l.* 10*s.*; quantity, 1½ per cent. on 1,225*l.*, 16*l.*, with other items. The defendant offered to pay at the rate of 2 per cent. on 600*l.*, 12*l.*; estimates, 1½ per cent. on the same sum, 7*l.* 10*s.*; lithographing, &c., 2*l.* 10*s.*, with other items, making a total of 23*l.* 11*s.* 6*d.* The defence was that the architect was limited by the defendant to a cost for the building of not more than 420*l.*, and the want of proper care and skill on the part of the plaintiff in not preparing plans in accordance with that limitation was the reason why the buildings had not been proceeded with. His Honour said that the defence went to show that the plans were worthless, and that the defendant need pay nothing, whereas he had paid money into court. Counsel for defendant contended that he was entitled, if he wished, to take up the position his Honour suggested, but the plaintiff, he admitted, had done a certain amount of work for the defendant conscientiously, and for this he should be paid. Evidence was given on behalf of both parties, and it appeared that a clause in the deed provided that no house should be erected on the land to cost less than 120*l.* The defendant said that he proposed to get over this provision by taking an average of the cost of the existing houses and the new ones, and that with this intention he instructed Mr. Smith that the new houses were not to cost much more than 100*l.* each, and the utmost limit was 420*l.* for the four. The jury found for the plaintiff for the sum of 37*l.* 10*s.* 6*d.*, including the money paid into court.

TESSERÆ.

Italian Monasteries and Roman Houses.

FLEURY observes that in monasteries we see reproduced the arrangements of the antique Roman mansion as Vitruvius describes it. "The church, which stands foremost, so as to allow free access to seculars, occupies the place of that outer hall the ancients designated atrium, from which was entered a court surrounded by covered galleries, known as the peristyle, precisely corresponding to the cloisters we enter from our churches; whence we pass into other compartments, the chapter-house answering to the exhedra, the refectory to the triclinium of the ancients; and the garden, usually at the back of the edifice, is placed also like that of the antique residence. A Roman Council in 826 ordered that, attached to the church, should be built cloisters in which the clergy may dedicate themselves to ecclesiastical pursuits, where there must be one refectory and one dormitory common to all"—a plan apparently intended for those of the capitular bodies who lived together under a rule. The primitive, monastic homes of Italy were almost all destroyed by the Huns or Saracens and rebuilt in the tenth century, for the greater part by German monks then esteemed as architects; some it is supposed (V. Ricci, cap. x.) by an Irish monk who had attained renown in this art, Dungallo, as his name is Italianised. Those ancient cloisters were, no doubt, plain and rude constructions, but one excel-

lently useful adjunct, the bath, is mentioned in several monastic constitutions. The use of this, in primitive times, was not only advised but enforced.

Colour and Heat.

The influence of colour on the heating of bodies was considered by Leslie in an original manner. It was found to be effectual only when the radiations are luminous. A thermometer painted black or white (provided the texture of the surface be the same) parts with its heat and also absorbs the heat derived from such a source as boiling water in an almost equal degree. The effect depends chiefly on the degree of polish or condensation of the surface. But with luminous sources of heat the case is widely different. This subject had been carefully considered previously to the date of Leslie's work by Sir W. Herschel, who had studied the absorbing power of different colours on the sun's rays. Black and white form the two extremes, and Leslie availed himself of this principle to construct his photometer, which certainly (whatever may be its defects) is an elegant modification of the differential thermometer. It is an instrument having one ball of black, the other of pellucid glass, and united by a tube of the form of the letter U, containing sulphuric acid tinged red as an indicator. As the texture of the surfaces of both balls is the same, dark heat is equally absorbed by both, and the indicating liquid remains stationary. But in the sun's rays, or even in common daylight, the dark ball becomes most heated; and it is not unreasonable to conclude that when the source of heat remains the same, its variations of intensity are correctly shown. Leslie, however, erred in considering that it was applicable to measuring light differing in origin and quality on a comparative scale; and this error he unfortunately persevered in, after unquestionable experiments had shown its fallacy.

Thomas Proctor.

Thomas Proctor (born in 1753) was a student of painting in the Royal Academy. At the time of the annual competitions for prizes he one year presented both a drawing and a model from the life for the premiums of the silver medal, and he obtained a medal for each. Afterwards he won the gold medal, and was carried by his fellow-students around the quadrangle of Somerset House. Benjamin West, struck with his merit, took proper means of communicating to him his advice to undertake some historical subject for the next exhibition. Accordingly, Proctor sent to the Academy the model of *Ixion on the Wheel*, which was so highly approved by the members of the Council that it was by their orders placed in the centre of the library, separate from all the models, and secured from risk of damage. The work was greatly and universally admired, and was purchased by Sir Abraham Hume. In the following exhibition Proctor, encouraged by success, sent a group of *Pirithous Slain by Cerberus*, which was not less admired than the former work, and was purchased by the same liberal patron. In a third year, conceiving his powers to be strengthened by experience, he undertook a much larger group of *Diomedes, King of Thrace, torn to Pieces by His own Horses*. This masterly work obtained a degree of admiration far surpassing that bestowed on his former models, but by no means exceeding its merits. In professional judgments it rivalled the powers of Michel Angelo, and stood inferior to Phidias alone. Benjamin West said that no praise could be too great for it. But the admirable group found no purchaser. At the close of the exhibition it was carried back to the house of the sculptor, who, stung to the heart with disappointment, and not being able to pay for a shelter in which to keep it, with his own hands broke the model to pieces. From this period Proctor appeared no more at the President's house, where he had become a frequent visitor. On inquiries being made, it was reported that he had lately been met very meanly dressed, and apparently labouring under the greatest dejection of spirits. A further research ascertained that after the unexpected neglect of his last work he had abandoned himself to inactivity, having taken a lodging at sixpence a night in a garret in Clare Market, supporting himself on no other food than dry biscuits, and resorting to the neighbouring pump for his only liquor. Deeply affected by this account, Benjamin West, who had become president, hastened to propose the consideration of Proctor's state to the Council of the Royal Academy, where it was immediately moved that he should be sent to Italy by the Academy, with the usual pension, and that 50% should be moreover allowed to him to make the necessary preparations for his journey. This motion being carried, he was invited to dinner by his friendly protector, and after dinner the resolutions of the Academy were communicated to him. Proctor listened to the report with extreme emotion. It was settled that he should instantly prepare for his journey in company with the President's son. Everything conspired to elevate hope and to promise satisfaction. The probable day of departure was named, and the grateful Proctor took his leave. About a week after this arrangement had been made a friend

of Proctor's, who lodged under the same roof with him, was announced at West's house. The door of the study was opened with eagerness, and the visitor was seen advancing along the gallery with tears in his eyes, and with a countenance full of sorrow and dismay. He came to relate that poor Proctor was no more. He had suffered from no particular attack of disease, but his exhausted and languid frame had not been able to support the sudden reverse which the favour of the Academy had produced in his situation and his feelings. The unceasing agitation of his powerful mind had overwhelmed his strength, and he had died that morning. Such were the talents and such the history of Proctor. Who that feels for his country will not regret the instance that has just been related? Was Canova to be sought in Italy and Proctor to die unnoticed at home?

Art and Contemporary Life.

The artistic products of a race—the labours of the true artist (not the skilled workman or artificer, so often mistaken for an artist)—ought to a certain extent to instruct us as to the view of the external world taken by the race or nation to whom he belongs. Generally the artist must of necessity be influenced by the race for whom he works, even although by force of genius he may rise above and despise them. In so far as he is competent to observe the truth in the external world, and is permitted and encouraged to express it in his works, to imitate the objects of the external world with truth and fidelity, and last and greatest, to place on canvas or represent in marble, man, his thoughts, actions, and the grand expressions of the inmost workings of human sentiment and passion, and those sublime forms which nature (the great artist) at times displays for the admiration of mankind, so will art in his hands reach perfection, and the approving race be placed highest in the scale of humanity. The aim of all artists is or ought to be to reach the heart. Homer, Horace, Burns, Shakespeare and Pindar, by a few words. The skilled mechanic aims at a baser principle, but strictly human; he cares not for the heart but the reason, conscious that he addresses principles equally potent in human affairs; he asks us to turn from nature's landscape to the Italian garden; from the oak and cedar to his neatly trimmed alcove; from the Medicean Venus to the court lady of the reign of Louis Quatorze or of any other court, where the milliner and the *modiste* have succeeded in withdrawing attention from nature's grand outlines to the costly silks and velvets, the trimmings of gold and silver, the pearl necklace and coronet studded with diamonds of unknown value. It answers for a time, and the artificer's labours are declared to be beautiful—by the present generation. By-and-by a new race appears, and the finished works of the artificers of the past age are pronounced to be antiquated, wretched, intolerable and out of date. But why out of date? Is the virgin forest ever out of date? the Medicean Venus, or the Apollo? The paintings of Angelo, Raphael, Leonardo, Rubens, Teniers; the descriptions of Homer, Shakespeare, Horace and Burns? Never. They are the works of men who saw the beautiful and the true in nature, and represented it as it is. They worked for all generations. Fine art, like a lofty literature, is the test of the character of every race. They reveal to us the view the race or nation takes of the external world, its regard for truth in literature, philosophy and science. Without this innate feeling there never can be any lofty civilisation; for the race which substitutes utility for truth and beauty, which worships only the useful, can never be made to comprehend the truth. They create a world of their own and admire and worship it, and as they work only for the present generation, that which follows holds them in contempt. The goddess such races worship is utility.

Utilitarianism and Art.

A knowledge of many useful arts is essential to the existence of man, nor is it easy to imagine the possible existence of any race, or even tribe, totally ignorant of the useful arts. On the other hand, to perceive the absolute truth and to represent this in marble or on canvas, to place before the eyes of men correct imitations of what nature has created, is the highest of gifts. In proportion as the individual or race gives a preference to the objects invented by mankind over nature's creations, so will the taste of that individual or race be low, unintellectual and remote from truth; his sympathies with the living world have been thrust into the background by the mathematical and logical inventions of human nature; he traces all to utility, the goddess he worships, and boldly proclaims that nature herself in her inventions had utility in view. Without being aware of it he worships human reason, and denies that anything exists beyond it. By carefully noting the artistic efforts of a race we may arrive at a tolerably clear idea of the view that race took of the external world; now in that view are included the character and nature of the civilisation of the race.

NOTES AND COMMENTS.

NOVEL buildings are indispensable for an international exhibition that is to be a success—we might say for every sort of exhibition. If the Albert Palace, in Battersea, had been original instead of secondhand, there is little doubt it would have had a very different fortune. The French Commission of the exhibition of 1900 are assured of the value of novelty, but how can it be obtained when the Champ de Mars site, with its legacy of buildings from 1889 and the Eiffel Tower, must be utilised? The fine arts galleries belong to the artists, and although they prevent the realisation of a comprehensive plan, they may be used for a sort of supplemental exhibition. But the colossal machine hall, with the fine roof that competes with the St. Pancras Station roof, is more of an obstacle. It cost about seven millions of francs, and it would be sold at an alarming sacrifice, but nobody has the courage to bid. One railway company offered to take it, but declined to give a sou for it, as the cost of taking it down and removal would be equivalent to its value as a station. The only escape from the difficulty will be by using the hall for agriculture, forest industries, &c. The demolition of the Eiffel Tower (which cost seven and a half millions of francs to erect) would cost about three millions, so it is likely to be tolerated. It is estimated that in spite of the drawbacks the exhibition of 1900 can in area be made to exceed its predecessor by one-half. In 1889 23,000 mètres were covered; in 1900 the area will be 34,000 mètres. The examples of fine art will be shown in the Palace de l'Industrie, in the Champs Elysées, which will be enlarged for the occasion. The contributions of foreign nations will be arranged at the Trocadéro. An immense bridge will unite the two shores of the Seine. As it will be arranged as a "hanging garden," and will sustain as picturesque a building as can be devised, it will be one of the most attractive features of the exhibition.

THE careful judgment which was given on Monday by Mr. Justice WILLS should be taken as a warning by anyone who imagines that the ancient principle, *caveat emptor*, is likely to be disregarded because sanitation is now considered to be a requisite in a habitable house. The defendant, in March, 1891, took a lease of a house in Harrow at a rent of 220*l.* yearly. He paid the rent for a year and a half, and then he sought to have the lease rescinded on account of misrepresentations about the sanitary condition of the house and the quality of the construction. Afterwards he abandoned the house. The defendant's excuse for refraining from lodging objections was that a promise was given to have the defects remedied. There was no doubt the plaintiff's son, who acted as agent in the transaction, did express an opinion that the house was well built and in a sanitary state. At the same time he agreed that any work which a sanitary engineer considered necessary should be executed, and that a certificate of sanitation would be given. The extra works were done about a month after the commencement of the tenancy, but by some oversight the surveyor's certificate was not procured. According to the learned Judge, the occupant of the house during the last six months of 1891—that is, in the first year of the tenancy—must have known "that the house was as bad as bad could be." The defendant and his family became very ill, and the cause assigned by the doctor was the dampness of the house. If the tenant then left the house and refused to be bound any longer by his lease, probably he would have succeeded. The law does not approve of dilatoriness, and by refraining from taking action until November 1892 he allowed his privilege to lapse. When action became necessary he employed surveyors, and of course the plaintiff imitated him. The evidence was so puzzling to the learned Judge that he was compelled to ask Mr. PILDITCH to make a special report. That document pointed out existing and contingent defects, and after reading it the Judge came to the conclusion that if the lease had been accepted on the assurance that the house was well built, and the notice to rescind had been given with proper promptitude, the right to rescind would be made out. Instead of an assurance, the defendant accepted the statement of the plaintiff's son, which was no more than an

expression of belief or of opinion. His lordship considered that the defendant had not succeeded in showing cause why his lease should be rescinded, but he was allowed a shilling-damages for the neglect to give him the surveyor's certificate. The case is not entirely satisfactory, but the result may be advantageous if people become convinced by it that the law will not always protect people who agree to live in unsatisfactory houses. If the defendant had obtained skilled opinion before signing his lease, he would have been spared illness, trouble, money, and—worse than all—the sense of suffering defeat.

It is reported from Pittsburgh that the Window Glass Workers' Association of that city have granted an application from the Chambers Glass Company for a loan of 50,000 *dols.* It is stated that this is perhaps the first case in which organised labour has been called on to lend money to capital. It should be gratifying to all except agitators and adventurers that for once labour has recognised that, if willing, it can occupy the position of a capitalist. The news will be unwelcome to the pinchbeck friends of working men, who for a short time have made positions for themselves, and thriven by disorganising the relations between what they invidiously term "labour and capital." We ventured to remark before this that the common-sense of our workers here and of others elsewhere would before long come to disregard the specious words and random promises of such friends, those whom BUFFON would probably have classified as belonging to the genus "vampire." The story of the impecunious syren who has acquired place and money by trading on the generous instincts of our workers, and has led them to give up their bread to their own and their country's disadvantage, cannot for ever charm the ear of practical working men. It is a good omen to see that the fallacy that capital is something antagonistic to labour is about to be exploded. It may be true that only with exceptional chances, and those chances rightly utilised, can an individual worker become also a capitalist. But hitherto under the misadvice of the self-constituted champions of labour, workers have been deluded and foregone the chances fully open to them in combination to exercise their power to be also masters of capital. Thrift, without any rigid practice of it, might involve a little self-sacrifice. This would be for all classes in the country distinctly preferable to strikes and railing against the minority who have acquired capital, and along with it anxieties and responsibilities that are ignored by agitators.

It is absurd to believe that picture dealers can be more infallible than their neighbours, for they have their weaknesses which can be turned to account by crafty and dishonest men. What is easier than to write on a scrap of stained paper—"To my dear friend T. HUNTER.—J. C."? Yet that scrap helped to convince dealers having the experience of Messrs. WALLIS that it was the dedication of a picture by JOHN CONSTABLE, and in consequence they offered 160*l.* 13*s.* for it in CHRISTIE'S rooms. It occasionally happens that a dealer allows himself to be cheated through fear his reputation as an expert will suffer, but after better acquaintance with their bargain Messrs. WALLIS wisely declined to pay the money, and their customers are likely to applaud their courage. They were not the first in the trade to be deceived. The vendor, Mr. POLAK, has been a picture-dealer in Manchester for fifteen years, and he gave 10*l.* for the masterpiece. Previously it was the property of other dealers. At one time the value placed on it was 50*s.* What price must have been paid to the unfortunate artist who was so well able to paint in CONSTABLE'S style as to deceive the most wary purchasers, and who had to impart to a canvas the appearance of age? Probably for all his artistic and chemical ability he did not receive a reward of 20*s.* The case ended by the plaintiff agreeing to take back his picture and to pay the defendants' costs, while all charges of fraud against him were frankly withdrawn. The picture has now a history which will impart value to it in the eyes of many amateurs. The case is a further testimony to the wisdom of SYDNEY SMITH'S resolve, which was never to pay more than 30*s.* for a work by a great master.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

The following gentlemen were elected new members:—Messrs. H. Astley, J. G. N. Cliff, G. H. Paine and A. H. Roe. Mr. J. DAYMOND read the following paper on

Wood-carving.

It was with much diffidence that I accepted the kind invitation of your committee to read a paper on "Wood-carving" to you this evening. I felt that it could have been placed in abler hands, but at the same time thought that I might place some facts and thoughts about wood-carving before the students of this Association, that, together with the practical illustrations, models, drawings, &c., before us, would prove both interesting and useful to them. Many facts that seem commonplace and elementary would no doubt be new to them, and my paper is, therefore, more particularly addressed to those who are studying for their profession than to architects in practice.

The craft of the wood-carver is of great antiquity; Egypt furnishes the earliest examples. To its dry climate and the care they bestowed on the preservation of the dead, we owe much of our knowledge of ancient work. In the British Museum are fragments of the wood coffin of Men-kau-Ra, a king of the fourth dynasty, and builder of the third pyramid of Gizeh, B.C. 3600, which has incised hieroglyphics on the face of the wood executed with much skill. The gilded wooden coffin of An-antef, a king of the eleventh dynasty, about B.C. 2500, has the portrait carved in bold relief on the lid, showing great ability of treatment. A wooden figure of Rameses II., from the doorway of his tomb at Thebes, compares very favourably with work of a much later and more modern period. There is also a statue of another king of the same dynasty in the collection. The examples of mummy cases for animals, notably those for the sacred cats, some carved furniture and animals used for toys, are all very interesting as specimens of ancient wood-carving.

The treasure-house known as South Kensington Museum contains a wonderful collection of wood-carving of many periods and climes. Scandinavian and Norwegian interlaced work of the tenth and eleventh centuries, bold and vigorous in its treatment. Some wooden shafts formerly supporting an organ of curious South Italian work, about the thirteenth century, whilst examples of fifteenth and sixteenth-century work abound, some of which we may note at random. The very fine oak doorway of the council chamber, Oudenarde, one or two panels from which are sometimes copied and placed by themselves in a wilderness of plain surroundings, giving a starved effect, utterly different to the rich massing of ornament so conspicuous in this and other examples. The exceedingly bold treatment of the overmantel of chimney-piece from Bruges is worthy of notice. The altar-stall from St. Denis is extremely light and fine in its detail. The boldly-carved doors with elaborate canopies and carved statues from the portal of the cathedral at Aix, in Provence. The sedilia of Ulm Cathedral is one of the finest examples of South German carving, whilst the examples of furniture, cabinets, frames, carriages and screens are so numerous that we must pass them by. They are accessible to all, and the humblest craftsman can study at leisure there the finest specimens of his handicraft. The panelling from a room near Exeter, 1600, is worth noting, while the collection of English work of the seventeenth and early eighteenth centuries is becoming very large, and contains many very fine examples. Some capitals from Drapers' Hall show the method then in vogue of building up the work. Our own churches and mansions contain fine examples of wood-carving in screens, stalls, roofs, &c., from the fourteenth century through the Elizabethan period to the time of Grinling Gibbons, whose examples of unparalleled technical and artistic skill are to be found scattered throughout the country, also in St. Paul's and many of our City churches. It was our good fortune to have an opportunity of studying the carving in the choir of St. Paul's a short time ago, for a room we were carving in the style. I only wish that the choir were more accessible, for it is a perfect mine of wealth in design and execution for the wood-carver. Gibbons died in 1721, but his school influenced wood-carving down to the middle of the eighteenth century. Country and town houses abound with acanthus carvings to doorways, chimney-pieces and other fittings, executed in a fine though unpretentious style with a masterly hand. Every cut of the chisel or gouge tells, and these enrichments were executed

by craftsmen without hesitation, and can be carried out with considerable rapidity of execution. But it is not my purpose to deal with wood-carving historically, so I will pass to the practical part of the subject at once.

The wood for carving should be the best of its kind, free from knots, shakes or other defects, as the specification always mentions, well and naturally seasoned, that which is baked, steamed or seasoned by any artificial means being harsher and more brittle under the tool, or, as the carver says, "without any nature in it." Unless the work is small in detail, the wood should not be too hard to produce the best results. Take oak, for example; if the wood has hard fibres running through it, like most of the American species, it is much more difficult to work, and prevents one using their tools with freedom. Figured woods, again, most of which figure is produced by the change in direction of the fibres, are difficult to finish. The carver has to continually change the direction of his tool, which prevents those happy effects and twists on the face of a piece of foliage or ornament, which seem to suggest themselves naturally if the course of the tool were not impeded by the different directions of the grain. (Some specimens of wood on the table will explain this better than words.) To obtain clean-cut work the carver must cut with the grain, much as a boy who whittles a stick with his knife or a joiner planes a board with his plane. The piece of padouk has been faced with a metal plane, a cut has afterwards been made upon the face with a flat gouge; you will see that one-half of the cut is clean, whilst the other is against the grain. The piece of mahogany has also the same defect, which increases the difficulty of cutting the work clean. A piece of carving cut against the grain is seldom satisfactory; it can be done, but to dig a piece of ornament out of the end of the grain is a very vexatious proceeding, and withal expensive. Take a simple illustration:—An impost cap, carved with egg and tongue, if worked by the joiner in the solid, the returns are end grain, and the ornament must be cut against the grain or fibre of the wood.

A piece of good Riga wainscot is the best wood for architectural carving (but it is now very scarce, and the Hungarian oak is the best substitute); the grain is not too strong, and one can deal with it with more freedom than any other wood. Mahogany is very variable. Some kinds are very good, others very indifferent, the Mexican and African, for instance, cutting very much like cork—that is, it will not stand against the tool. The harder kinds of Cuba and Spanish mahogany are rather more expensive working, especially if figured. Teak is a good wood for carving; it wastes freely, or perhaps we should say the surplus wood is easily removed and the work shaped readily. Another advantage possessed by teak is that when used for purposes where the material is cut away more in some parts than others—as, for instance, an animal terminal or very bold panel out of 6-inch or 4-inch plank—it is more likely to stand than some of the other varieties of wood. Its only fault is that the grit in it dulls the edges of the tools rather quickly. Walnut is a fairly good wood for carving, the American being the easiest to cut. The English is very close and firm in the grain, and some of it is very hard. The American walnut is rather remarkable for showing a whiteness on the surface of the wood after it is finished, if viewed in certain lights. On turning the wood round the whiteness is reversed; this, of course, disappears if the wood is polished. Italian walnut carves very well if straight in the grain. Satinwood carves well, and, being light in colour, the work is effective. Pine is less expensive to carve, but it is easily damaged if used for undercut work. Lime tree is a splendid wood for carving, but so perishable that one can only recommend it for temporary use, such as patterns for metal casting, for which it is admirably adapted, although some founders prefer mahogany for that purpose. Kawrie pine cuts well, but has the reputation of shrinking lengthwise in addition to across the grain, a fatal defect for joiners' work that cannot be provided against. It is quite enough to have to contend with the ordinary shrinkage in wood without the shoulders of framing showing an open joint when the work is finished. Some samples of bass or American white-wood cut well, some very badly. English cedar and pear tree are also good woods for carving. Pitch-pine is unsatisfactory; the darker portions of the fibres are hard to work; it develops shakes when the wood is cut into, and if very dry it is harsh and short under the tool. In fact, pitch-pine and yellow deal are nearly at the bottom of my preference of woods suitable for carving. Sequoia (the red wood from the mammoth trees of California) is simply bad, and it is well-nigh impossible to get any life into the work. It cannot be cut clean across the grain, and dulls the tool almost immediately. Cork is almost preferable. Most of the Australian woods, yarra and others, padouk wood from Burmah, are all very indifferent for the use of the wood-carver.

The tools next claim our attention. They require to be of the very best steel and well tempered. The shapes seem to have varied very little through the centuries; some found in the Pyramids, and now in the British Museum, are similar in shape, but made of copper or bronze, to the tools of the present day.

A wood-carver requires a set of flat gouges from $\frac{1}{4}$ inch wide to $1\frac{1}{4}$ inches; a set of quicker section gouges, called "fluters," though used for many other purposes than fluting; some flat tools of varied widths called "firmers"; small quick-section gouges known as "veiners," though the less they are used for putting veins on the faces of leaves the better for the appearance of the work. V-shaped tools, called "parting tools," are also necessary. Besides all these, a certain number of similar tools, but bent instead of being straight, are required. These are necessary to take up the cutting in the hollows or undercuts where the straight tool would stick into the grain of the wood. There is also a variety of tool known as the "macaroni," which is of doubtful utility for ordinary work. A set of oil-stones ground to fit the various sections of the gouges and called slips is indispensable; a leather strap prepared with tripoli, similar to a razor strap, for putting a fine edge on the tools after sharpening with the slips is also necessary. Small wheels are used to clean out the inside or concave surface of the bent tools. A mallet of wood, lead, or iron, bench screws, clamps for holding the work and a pair of compasses, make a fairly complete list. All wood-carvers' tools require to be carefully sharpened, and kept in good order, if the work is to be cleanly and well finished. We may note that the tools are generally sharpened by rubbing both sides, and not as joiners' tools with cutting edge at one side; for soft woods the tools must be sharpened at a more acute angle than for the harder varieties. To distinguish the tools from one another as they lie upon the bench, the carver uses wood of various colours and shapes for the handles of them. Those not in use are generally kept in a small chest containing a quantity of small drawers or trays. On the table are specimens of carvers and joiners' tools, showing the different methods of sharpening. The bench must be kept free from grit if we wish to preserve a good edge upon the tools.

The simplest and most inexpensive kind of wood-carving is that in which the outlines of the design are first set in from the face of the wood, and a gouge or other tool then being used, to make a sloping cut to meet it, thereby taking out a chip or piece without leaving any rough places or awkward corners to be cleared out afterwards. This description of ornament is used very frequently on Jacobean furniture and old chests; some spandrels of the Gothic period are also examples of this kind of treatment. The faces of acanthus leaves in the enriched mouldings and some of the capitals of the seventeenth and early part of the eighteenth centuries are also worked in a similar fashion. This treatment obviates grounding out the ornament, which must be done in ordinary work, such as a spandrel or panel showing a background.

We will now describe the method of carving an ordinary panel or spandrel. The joiner has rebated the wood all round to the depth of the groundwork for the carving; if it is a large panel he has glued it up, in this case taking care to put the tongue in joint far enough back to prevent us cutting into it; a precaution which, I am sorry to say, is not always observed, to the obvious detriment of the work, especially if the cross tongue is of deal in a hardwood panel. We sketch or paste a tracing of the design to be carried out on the wood, and proceed to cut away the parts that are to be the ground of the panel, afterwards using a tool known as the "Old Woman's Tooth" to rout out the wood to the required depth. Care must be taken during this part of the work that no cuts made by the chisels or gouges in forming the outline should go below the surface of the ground. In hurried work this is a very common occurrence, and frequently shows much if the work is afterwards polished. This seems a very mechanical proceeding, but it is the general method; one reason is that when the face of a piece of wood is roughly cut away it is difficult to sketch upon, therefore the carver likes his outline set in first, that he may be able to keep to his design. When the panel is grounded, the finest skill of the craftsmen is called into play to balance the masses in the design, decide the parts that are to be in high relief, in contrast with those near the ground, and generally to arrange the projections so as to produce the best effect. In fact, this part of the work tests the ability of the workman to the utmost degree, and shows whether he is a skilled craftsman or merely one of those who, unfortunately, never seem to be able to master their craft, and always require a model or copy, which they reproduce with more or less success. After the panel is roughed in, if possible, it is advisable to put it on one side for a short side; it is good for the material, for, after cutting away one side of a piece of wood, it is well for it to be laid by. It is also frequently good for the design; when taken up again to finish the work faults are less likely to be overlooked than if the carving is finished off without interval. The outlines are generally cleaned up first, then the ground finished to them, the face of the work being the last part to receive our attention. Here, again, the craftsman has an opportunity to show his ability, or otherwise. The groundwork of panels is sometimes stamped to give a matted effect and bring out the ornament, but it is not a desirable treatment, giving a common appearance to even good work. The best finish for

the ground is that of a slightly undulating but smooth surface.

We will next take a length of moulding, egg and tongue or leaf enrichment, for example. First space out the ornament, then mark the outline upon it and set it in as we did with the panel. The groundwork is next picked out and the face afterwards carved, the more projecting parts being finished last. If egg and tongue, the shell is set in, the egg shaped and finished, the tongue being carved afterwards. We may remark here that full-sized sketches of egg and tongue or other mouldings as given us are often very deceptive. The enrichment is generally drawn on the moulding in elevation, probably looking fairly broad or otherwise in correct proportion, but when developed on the actual moulding it becomes quite different, and really works out very much narrower than was expected. If these sketches are set out for short breaks, it is evident we must either alter the arrangement or execute the work to a different proportion than that shown or intended. Gothic strings and space ornaments are sometimes cut in the solid and sometimes applied in both old and modern work. If applied with an intervening space between the carved portion and the cavetto background, there is a lightness of effect and more shadow than can be obtained if they are worked out of the solid stuff. The section for a carved moulding is an important point; if it contain deeply-sunk hollows the carving must be done with bent tools, which increases the time required for its execution. The model for an architrave similar in section to those at Hampton Court Palace, but with simpler detail, is a good example of its kind; but flatter sections are much more economical to work.

Capitals generally should be prepared with the grain of the wood vertical for carving. If the grain is horizontal, as for Ionic caps with angle volutes, they must be glued up at the mitres or angles, otherwise two sides have to be carved endwise in the grain. If the caps are of any size they should be built up. Take a Corinthian cap, for instance: a good method is to glue up the bell in sections with angle and centre scrolls in the same pieces of wood; if for a column, have the bell turned. The scrolls and husks can then be carved and well undercut, or pierced if preferable; the lower tiers of leaves being absent, there is more room to get at the undercut parts. The leaves for lower part of cap are shaped and carved separately, being afterwards glued on and screwed from the back or inside. It is also convenient to build up the abacus in pieces, and if properly put together with dowels and well screwed to the cap, the whole will stand better than if cut from a solid piece of wood, even if such could be procured large enough for the purpose. The Corinthian caps on the choir screen at St. Paul's Cathedral are built up in a similar fashion to that just described. If the caps are executed in the solid, the probability is that roughing-out and exposing fresh parts of the wood to the action of the air will cause the outer parts of cap to shrink rapidly, so that splits or shakes develop themselves, which, after a time, may or may not close up again. It sometimes happens if the shakes are filled up they will split up the cap, acting as wedges when the inside parts of the wood shrink.

The endless or band-saw and fret-cutting machine are valuable aids to a wood-carver when the outline can be cut or pierced before the work is shaped or roughed-out—cresting or tracery for instance. The small terminals on the table will demonstrate this. One is as it comes from the saw, the next with the superfluous pieces knocked away and the third roughed out. This method is sometimes adopted for work with a background, especially if in high relief; the outline of design is cut with the saw, being afterwards glued upon a background and well screwed from the back, or, if for painted work, fastened with fine nails or brads from the face as well. The carving is sometimes done before and sometimes after being placed on the background. By this means the operation of grounding is saved, but the perfectly level background is not so artistic-looking as the slightly undulating one produced by the first method described. It is almost needless to say that the design must be thoroughly thought out before the fret-cutting is begun. The large console on our left was cut to the outline before being carved; the surplus wood is thus easily removed; it is then roughed out, and afterwards finished as described in the case of a panel. The enriched three-quarter column was first made out with deal to complete the circle, then turned and carved. The mouldings forming the cornice and those round the panel in satinwood were prepared with the aid of machinery, then mitred up and fitted by a joiner, the joints carefully marked and protected; the pieces are then carved before the mouldings are glued up, the mitres being finished off afterwards. The wood-carver always prefers his work in small pieces; as a rule, he lays and fixes it on the bench before him, whereas the stone-carver, if possible, puts his work up in front of him. It is rather remarkable that in those cases where the craftsman is both a stone and wood-carver he puts the stone up in front and lays the wood down before him. The explanation is that the stone-carver does

most of his work, even when finishing, with a mallet or hammer, whereas the wood-carver, hampered by the grain of the wood, has more power over and a freer use of his tools by having the work below him.

Wood-carving executed *in situ* is always much more expensive than if done on the bench before the work is put together. Cutting tracery is part of the wood-carver's craft, though it is often left to the mercies of a joiner, who gets as much as possible done by a machine, which takes all the spirit out of the cusps, the pockets and mitres being sometimes wonderfully and sometimes fearfully worked afterwards. Simple quatrefoils on the table show the difference in the appearance of plain cussing when worked by hand and by machine. Those worked by hand stand up and have a crisper effect than the one taken off to a dead level by the machine. The slightly-varied section of the moulding as worked by hand is also better looking than the mechanical hollow which runs with unfailing regularity through the machine work. While speaking of tracery we may mention that amongst the small models will be found some examples of carved cusps and terminations. An interesting branch of wood-carving is the preparation of models for metal-work. These, if very small, such as bows for keys, are made of boxwood, the larger patterns of lime tree, pear tree or mahogany. This work requires considerable skill and judgment in order that the pattern may lift from the mould without damaging it. All undercuts must be avoided, and the effect obtained without them in ordinary work, for obvious commercial reasons. It is often necessary to make the pattern in several pieces in order to draw it out of the mould. They are sometimes cored or worked out at the back to the thickness of metal required and sometimes solid, at the discretion of the founder. There are some examples of patterns before us: that for the hob of a grate was made for a fireplace exhibited at the late Arts and Crafts Exhibition. The terminals were for the gun-metal gates at the New Gallery. There are also some patterns for a tomb railing and parts of a monument prepared for execution in bronze. Into the province of designs for wood-carving it is not my intention to enter, but it is desirable that they should be worked out on paper, or a model made, that the craftsman may cut into the wood without hesitation, or as we say, "without having to feel his way." He should be able to mentally see or imagine the effect of his work when finished, before or whilst roughing out the subject. Figures always require modelling before being carved, unless they are to be in very low relief, in which case a skilled carver can produce good effects with the aid of a careful drawing.

The spandrels of which a set of photographs are exhibited were executed in this way. The plaster models for figures, animals and ornament exhibited have all been prepared for wood-carving. The angels with instruments, labels, &c., on screens were executed in mahogany for the reredos shown in the photograph below them. On the table are models for stall terminals, heads for seat elbows, some animals for staircase newels, also carved drums for columns, and other architectural features, some in wood and some in plaster. Specimens of old work are also on the table. In the fifteenth-century panels from Sedburgh Church the treatment of the face of the sacred monogram should be noticed. Two carved stair-ends, date 1790, are similar in design, but show just sufficient variation in treatment to mark them as handicraft, and not machine or cast work. Some casts of small spandrels from an old screen at Hayes Church, Middlesex, should have been here; there is a photograph of an inlaid and carved table, the date 1605 being worked in inlay on the frieze. We might mention that the church, so near London, is well worth a visit, the fifteenth-century roofs remaining in nave and aisles; there are also some good brasses, a fresco-painting, the old timber porch, and other interesting features still to be seen. Concerning polishing, as a rule some polish is required to protect wood against changes of temperature, and to keep it clean or bring out the colour. If left from the tool or plane some woods soon show the dirt very much, especially in this city of ours, and therefore some protection is necessary. But let there be as little polish used as possible. It is generally applied with a brush, and needs great care, for at the very best it spoils the appearance of the carving, for a time at least, and certainly in no case does it improve the work. It is generally disappointing when one sees their work for the first time after being polished. Teak is a satisfactory wood from this point of view, it being a good colour and standing well without polish. A good treatment for oak is to have it fumed in a chamber with ammonia, afterwards finishing with wax polish.

Just a word respecting apprenticeship. Unfortunately, it seems to be going out of fashion in this as in other trades and crafts. Personally, I do not think anything can take its place entirely. The technical schools are invaluable as aids to the young wood-carver, but cannot altogether substitute the training to be received in a shop; the experience gained upon actual work is not to be obtained in any other way. The present system is that lads try to become attached to a shop as improvers, with a tacit understanding that, if they are industrious

and behave themselves generally, they will be retained on the general staff of workmen. There is a certain advantage in this plan: that the lad knows that he is liable to dismissal if he does not behave himself, and further, that the more interest he takes and the better craftsman he becomes, the more it is to his employer's advantage to keep him.

In conclusion, we would urge that architects should always retain some control over both the quality and prices for wood-carving. In many cases this is done to the obvious advantage of the work, but in others it appears in the quantities included, perhaps in so many feet super of framing or doors, all to be executed as detail at end of bill, which said detail gives a very indefinite amount of information, thereby making the carving quite a negligible quantity until the full-sized drawings appear, when the architect's requirements, the builder's provision for cost and the carver's views of the matter are far as the poles asunder. In many cases it is impossible to do justice to the work and the result is painful to all beholders. Wood-carving to be done well must be paid for, therefore it seems to me that some control should be kept over the price as well as the quality of the work. I must now thank you for the kind attention given to my paper, hoping that the remarks may help to excite some interest in the subject and that it may be understood that there are some earnest workers in the craft, though their productions are often sadly handicapped by the limit of prices, quality of material, the multiplicity of styles that there are used, and wherein the conditions of work in the present day differ so much from those of the old craftsmen, in whose time a style came into existence, was developed and died out in a kind of natural evolution, whereas now it is one period to-day and another to-morrow. But if the craftsman bring some study to bear upon his work and strive to produce the best that is in him, surely his productions should have something of true craftsmanship about them.

A vote of thanks, proposed by Mr. Pite and seconded by Mr. Bolton, was passed by acclamation to Mr. Daymond for his paper, and the meeting adjourned.

GLASGOW ARCHÆOLOGICAL SOCIETY.

AT the meeting of this Society last week, in the hall of the Philosophical Society, Dr. Alexander S. Murray, of the British Museum, lectured to the members of the Glasgow Archæological Society on the Subject of "The Tomb of King Mausolus and its Attempted Restoration." Professor Ferguson, of Glasgow University, presided, and there was a large attendance. The lecturer gave a minute description of the tomb, which, he said, had been characterised as the eighth wonder of the world. Referring to King Mausolus, he said that history bore out that he was a rather oppressive monarch. References to the tomb in ancient literature had tempted some of the greatest English architects to sketch a restoration of it. Even Sir Christopher Wren, despite his many other activities, found time to undertake such a work. The lecturer also spoke of similar efforts by several of Wren's successors. Dr. Murray was cordially thanked for his address.

LINLITHGOW PALACE.

AT the meeting of the Architectural Section of the Glasgow Philosophical Society, held on Monday night, the president, Mr. Campbell Douglas, architect, in the chair, the hon. secretary, Mr. A. Lindsey Miller, read a paper, "Notes on the Palace of Linlithgow and Church of St. Michael." In his remarks he drew attention to the close association of Linlithgow with the early history of our country, lying, as it does, on the verge of Scotland's battlefields, and also from being the favourite residence of the Stuarts. Here, in 1301, Edward I. fixed his winter quarters during his expedition into Scotland to reduce the Scotch, and built what Barbour calls a "Peel." During the time of Bruce the castle was taken by stratagem. The king reduced the fortification. The minority of James III. was passed in the palace, and Henry IV. found refuge when dislodged from the English throne by Edward IV. From Linlithgow James IV. started on the fatal expedition to Flodden, and in 1542 Mary Queen of Scots was born there. The connection of royalty with Linlithgow closed with James VI., and in 1746, while a body of Hawley's Dragoons were lodged in it, the palace, through their carelessness, was burnt. The church of St. Michael, which stands near the palace, is first noted in the twelfth century, being dedicated in 1242, and about the time of James III. would probably be complete. It has been added to and altered at different times, but it is still considered the most important specimen of an ancient parochial church existing in Scotland. The paper was illustrated by numerous limelight views, taken by the lecturer, and at the close a vote of thanks was accorded him for his paper.

THE BUILDER'S ART IN CHINA.

CHINA is generally regarded as the land of "topsyturvydom." In nine cases out of ten its inhabitants arrive at any given result by adopting a course directly opposite to that pursued amongst ourselves. Thus the leaves of their books are open towards the sewing, and double at the outer edge. The workman draws the plane towards him in place of pushing it from him. The candlestick fits into the bottom of the candle instead of *vice versa*, and so on. Instances might be cited indefinitely, and in a good many respects the art of building follows the same lines. Whether its professors can teach westerners many useful lessons may be doubtful, but there are undeniably a few hints to be gained from a study of even the much ridiculed Celestial architect's way of doing things.

It is somewhat singular that a country possessing so long a history, and here and there monuments of such undoubted antiquity, should combine with the latter so general an appearance of modernism in its ordinary public and private buildings. There are no architectural ruins in China. The fact, however, is easily explained. Stone, the least perishable of all the building materials in ancient times, or brick of the sort which hardens rather than crumbles by exposure to the weather, has never been employed by the Chinese, save for buildings connected with fortifications, bridges, mausoleums, or pagodas and temples. Owing, no doubt, in part to the fact that the tent pattern for every description of dwelling was originally adopted, and has never since been departed from, and to the further fact that no Chinese potentate has ever attempted to raise enduring monuments in the shape of palaces or public buildings, original design has been cramped. Nor for the past few hundred years has any inventive genius manifested itself amongst the people. Innovation has been sternly repressed by the teaching which holds the imitation of the past the highest value. That invention once held its own is, of course, undoubted. But somewhere about 300 years ago the then condition of affairs appeared to crystallise, and China has ever since remained *laudator temporis acti*.

Before dealing more especially with the ordinary buildings of the country, a few remarks concerning the more substantial erections may be of interest.

length of bridge is required, stone piles are erected at about 30 feet distance from each other. Upon these are laid large round beams, across which planking is nailed. Earth is then placed on the latter, and the top is paved with brick or stone. Such erections naturally decay rapidly, but the stone pavement often comprises blocks of very large size. At Changchow-fu a bridge of this description carries granite stones of 24, 33 and 45 feet in length by 2 in breadth.

CHINESE BRIDGE.

A conspicuous feature of the landscape in most parts of China is the misnamed "Triumphal Arch," its sole resemblance to the European erection so called being that it is simply a commemorative monument, in honour of distinguished personages, or of parents, or even women who have exhibited some special virtues. Many are built of wood, but the more important ones of stone elaborately ornamented with carvings. The tile

PAI LO, OR TRIUMPHAL ARCH.

The Arch and Bridge.

A somewhat curious fact strikes the inquirer at the outset as regards the use of the arch. That for many ages the Chinese have been well acquainted with its construction is indubitable, but they make comparatively little use of it. A sufficient number exist, however, to show that they are able to construct them of any desired shape—semicircular, pointed, or horse-shoe, the transverse section of an ellipse, or even that of the Greek omega, the span being widest at the top. They are, however, in nearly all cases single; the idea of a succession of them to form a bridge, such as those over the Thames, seldom having occurred to the designers. In the illustration above given, the stones for the arch are cut in segments, each end carrying very short tenons morticed into transverse blocks of stone stretching across the bridge. The segments decrease in length from 10 feet at the spring to 3 feet for the vertex-block or keystone, the latter being also morticed like the rest into two transverse stone blocks. Owing to the disposition of the strains, European engineers pronounce this arch to be unfitted for supporting great weights. When a considerable

root usually added gives them a top-heavy appearance, but they form conspicuous and quaint additions to the surrounding scenery.

Fortifications.

No notice dealing with Chinese masonry would be complete without some allusion to the celebrated work known as the Great Wall, remarkable alike for its solidity and its length. It extends for a distance of 1,500 miles, crossing plains and valleys, and climbing the steep sides of mountains. Across the valley it consists of a square crenellated wall, such as surrounds most Chinese cities, about 32 feet in height at the level parts, decreasing to 10 or 12 feet when commencing the ascent of a precipice. Here, in some places, it assumes a step-like elevation, the stone used being limestone and porphyritic granite, cemented together with chunam. Most of the portions crossing the more lofty spans are of triangular section, from 15 to 25 feet in height, with an average base of 15 feet. The apex consists of a single layer of stone, about 8 inches wide, thus permitting the ambitious traveller to sit astride it. Towers are placed at every sixth of a mile, but are

mostly in ruins, though the wall itself, dating back for over 2,100 years, is still in good preservation. Its chief interest, from a constructive point of view, lies in the extreme hardness of the mortar used, which almost defies the pickaxe or crowbar. The close joints and mortices of Egyptian ruins are never found in China.

The ordinary forts are generally mere earthworks, but those of a fortified city like Pekin are of wood, built upon the encircling wall over each gateway. This wall is of fine dimensions, 22 to 55 feet wide, perpendicular on its outside front, with the inner side sloping. Parapets are erected on both the inner and outer faces of the wall, that on the latter being loopholed and crenellated. At intervals of 50 to 60 yards are large buttresses, every sixth being of much larger size than the others. The smaller ones are about 15 to 20 feet square, and all are parapeted like the rest of the wall. Part of the inner portion having fallen away, the writer was enabled to observe its construction. Near the gate the walls are occasionally faced with stone, but in other places with immense bricks almost as hard. The space between the facings is filled up, firstly, by a solid foundation of concrete, some 10 feet in depth; then by a layer of well rammed earth of about the same thickness; another layer of concrete and another of earth succeed, the latter being paved with large blocks of granite, which form the *terre-plein*. The concrete resisted all the efforts of our sappers to form a trench on the *terre-plein* during the last war.

Each of the gates has a buttress on either side, connected by a semicircular wall, which thus forms an *enceinte* with a central gate. The arches of the gateways are well built, and above each gate is one of the pagodas above mentioned. They are three-storeyed and fitted with numerous port-holes, through which project the muzzles of the defending guns.

Forts in some places, especially those on the Pearl river, are built of stone with embrasures, and the guns mounted *en barbette*. The whole science of fortification is, however, in a very elementary state.

Mausoleums.

Just as the coffin and funeral ceremonies are deemed of supreme importance in Chinese eyes, the erection of a suitable mausoleum has frequently been an object of Imperial attention. The most celebrated in the country is known as the Tombs of the Thirty Mings—the dynasty preceding that now on the throne—and are situated about ten miles within the Great Wall, north of Pekin.

After riding over some rather rough ground, the traveller passes through three of the triumphal arches above described, and comes upon an avenue about two-thirds of a mile in length. On either side of this are sculptured figures of animals and men of colossal size, and distant about fifty yards from each other. The figures comprise six kings or priests, two horses, two griffins, two elephants, two camels and four lions. Passing these one reaches the largest and most celebrated of the tombs, that of Yen-Wang. The shrine is in the centre of an immense hall, 220 feet long by 92 feet 8 inches broad, and supported by thirty-two pillars, exclusive of those in the walls. Each pillar is 11 feet 4 inches in circumference and about 60 feet high. The ceiling is in good preservation. It is noteworthy that the trees to form the pillars—each consisting of a single piece of wood—were all brought from Burma just 250 years ago, China not producing any suitable timber. A second building, containing the coffin of the deceased emperor, lies about 50 feet behind the great hall. It stands upon an immense brick mound pierced by a long, sloping tunnel, which has a most remarkable echo, and is, moreover, a whispering gallery. The above description will suffice to show the style of building.

Pagodas and Temples.

No Chinese landscape appears complete to the average western eye unless a pagoda figures prominently therein; and it is not probably going too far to say that these buildings are the only ones of even moderate antiquity in the empire. Those most familiar to foreigners (the first and second Bar Pagodas at Whampoa) date back to 1598 and 1621 respectively. That opposite the gate of the British Consulate at Canton was built in the year 537 A.D. as a shrine for a relic of Buddha. Its original height was about 295 feet, and ten centuries after its foundation a pinnacle of gilded copper surmounted by a golden ball was added to it. Time and weather have, however, destroyed the upper portion, about 180 feet of nine storeys only remaining. A winding staircase gives access to the summit, but was so constructed that in place of being carried up through the interior shaft it was led from one storey to the next, so that in order to make the ascent it was necessary at each storey to pass through a doorway upon a platform carried round the exterior, and after walking round half the circumference, to re-enter at a doorway opposite, whence the staircase again led upwards. Owing to the ruinous condition of the pagoda and the rotting away of the platforms, the ascent is now impracticable. Passing birds have planted the seeds of large

trees on the ruined summit, which thus presents a singular appearance.

The well-known porcelain tower of Nanking was, perhaps, prior to its destruction by the Taeping rebels in 1863, the most

DOMES OF THE TEMPLE OF HEAVEN.

celebrated structure of its sort in the world. The external bricks were composed of coarse porcelain with a white glaze on the outside surfaces. It must have been an imposing looking building.

Temples.

One of the oldest buildings in the country is the Mohammedan Mosque at Canton, founded A.D. 850. It consists of a plain hall, the roof and pillars of which are in ordinary Chinese style, but in which the severe simplicity of the interior contrasts forcibly with the decorations of a Buddhist temple. The arches, forming two sides of the building, denote its Arabian origin, but it was, of course, executed by Chinese. A minaret at the side is 120 feet in height. Legend ascribes an antiquity of some 2,000 years to many of the temples at Canton and elsewhere, but there is little proof in support of so ancient an origin.

The general plans of most Chinese temples are alike so far as space permits. The following description of the celebrated temple at Honan gives a fair idea of the general arrangements. Passing from the landing-place through an unpretending doorway, an avenue bordering a pathway paved with granite is entered, leading to a square building forming a double gate with two colossal figures standing within the porch. Another small court and a third gateway have to be passed before the great inner quadrangle is reached. Here in the centre of the grassy enclosure dotted over with magnificent trees rises a platform supporting the great hall of worship some hundred feet square, in the midst of which tower the tranquil images of the past, the present, and the future Buddha. In front of these gilded figures is an altar of richly carved wood. On both sides of the hall are ranged the images of the eighteen Lo-Han, or apostles of Buddhism; and small tables covered with embroidered cloth serve as lecterns for the priests.

Another large hall, in the rear of the first, contains the image of the Goddess "Hearer of Prayers," and still further on, in the midst of a gloomy sanctuary, stands a pagoda sculptured in white marble, 30 feet in height, the gift of a former emperor. This item of decoration is, by the way, rarely seen in similar buildings. On both sides of the great quadrangle are long ranges of buildings intersected by courts and corridors, which constitute the apartments of the priests. A large hall yet further to the rear answers as the refectory. This opens on to a spacious garden, with fish ponds at the end. Beside the fish pond is a small mausoleum in which, after cremation, the ashes of all priests who die in the establishment are deposited.

The general style of temple architecture may be gathered from the illustration.

The pinnacles of the roofs are often of a most delicate and elaborate pattern. The tiles of all temples known as "Imperial," *i.e.* supported chiefly by the Government, are of a yellow colour, but in other cases blue or green is the favourite tint. The roofs are tiled as with ourselves in ridges and furrows, the chief difference being that the ridge tile is semicircular in section, thus producing the peculiar effect seen in the illustration.

The engraving on the next page shows the details of the roof of a well-known temple in South China.

The windows of temples, like those of all buildings in China, except where foreign intercourse has introduced the use of glass, are of paper. But we shall notice details of this nature more fully when we deal with the process of building.

The foregoing examples do not exhaust the designs of Chinese temple roofs, although they represent the vast majority. The pavilion in the Temple of Heaven at Pekin is, for instance, of totally different design. It is circular in form, is built in three storeys, and is about 80 feet high. It stands on

an altar consisting of a polygonal structure in three terraces, each about 10 feet high and respectively 120, 90 and 60 feet in diameter, built of white marble, and each protected by balustrades.

It may naturally be asked why palaces and public buildings, which in most countries present the best specimens of architectural beauty, should have been omitted in the sketch already given. But as a matter of fact, both these classes of buildings are, in general design, simply modifications of the

Houses and Shops.

The general design of the native house, however humble, is a modification of the more ornate temple or *yamen* (i.e. official residence and office). There is the same catenary curve in the roof with more or less ornamentation at the gables. A sober drab will replace the gaudy glazed yellow or green roof-tiles, and varnished or plain wood the brilliant paint-work of the more public edifice. But the elevation will still suggest the same general design.

TEMPLE ARCHITECTURE.

DETAILS OF ROOF.

temple and the private house. Although general descriptions of the emperor's palaces have often been published, no trustworthy details as to plan, architecture, or decoration have come to hand. It may also be remarked that although very ordinary inns or caravansaries exist, the temples mostly take the places of hotels in western countries. We now turn to private dwellings.

As already remarked, stone is almost unknown as a house-building material, except for foundations. Bricks, sifted earth, and matting or thatch for the walls, brick tiles for the roof, and wood for interior fittings are the ordinary materials used. Houses are sometimes constructed of wood alone, but are not common. No private house is allowed to equal in height the temples in its vicinity, nor be ornamented in the same manner;

nor may yellow—the Imperial colour—be used about the building. Cellars and basements are absolutely unknown. Two-storeyed houses are infrequent. We summarise from Dr. Wells Williams's well-known work the most important details as to Chinese house-building.

The *Ni Chuan*, or sifted earth, is a compound of sifted gravel and lime mixed with water and sometimes a little oil or varnish, of which durable walls are made by pounding it into a solid mass between planks secured at the sides and elevated as the wall rises, or by beating it into large blocks and laying them like bricks in a wall. When stuccoed and protected from the rain, this material gradually hardens. In houses of the better sort the stonework of the foundation rises 3 feet or 4 feet above the ground, and is laid with great regularity and solidity. Between the stonework and the lower brick-course an "anti-damp" layer of fine-cut straw is introduced, and this appears to be very effective. The fronts of the dwelling-houses present no opening except the door, and when the outer walls of several houses join those of gardens and enclosures the street presents an uninteresting sameness, unrelieved by steps, windows or porticoes. The walls are 25 feet to 30 feet high, usually hollow, or so thin as to be unable to support the roof unaided, nor are the builders very particular about their perfect uprightness. The bricks are the same size as our own and burned to a greyish slate colour, although red bricks are sometimes seen. They are made by hand, and cost from 3 dols. to 8 dols. (10s. to 17. 6s. per thousand). Lime is obtained from shells, and it does not appear that it is ever derived from limestone.

The walls are often stuccoed but not painted, and the bricks are occasionally rubbed smooth with stones and the interstices pointed with fine cement. In place of a broad cornice the top of the wall is frequently relieved by a moulded ornament in burnt clay representing a battle, landscape, cluster of flowers or some other design, defended from the weather by the greatly projecting eave. A black painted band, relieved by corners and designs of flowers and scrolls, is a common and cheap substitute for the carved figures. Chimneys are almost unknown. The smoke from kitchens is allowed to escape through a lattice roof, while open fires are never burned. The charcoal stove is generally used, but in the north the sleeping-rooms are fitted with kang or brick bed-places kept warm by a fire beneath. A hole in the wall acts as a chimney, but numerous deaths from charcoal suffocation take place every year.

In order to support the roof the purlins and ridge-poles consist of strong timber extending from wall to wall and the rafters of slender strips on which the tiles are upheld. In hipped roofs the principal weight rests on pillars, with a series of king and queen posts intervening, by which every part is equally supported; but curb roofs are not made, as attics are as unknown as cellars.

The pillars are of red or varnished wood without base or capitol, of disproportionate shape, and frequently ornamented with carvings or inscriptions, or concealed by scrolls. In the rare cases of the two-storey houses, or where it is impracticable to support the roof in this way, the rooms are contracted and the cross-walls built up to the plate, each room being covered with its own roof. The pillars are occasionally arranged so as to form side passages to the rear rooms, the intercolumniations being screened or built up. A slight ceiling usually conceals the tiling, but the apartments appear lofty owing to the elevation of the roofs.

The general arrangement of a Chinese dwelling of the better class, standing in its own grounds, is that of a series of rooms of different dimensions, separated and lighted by intervening courts, and accessible along a covered corridor communicating with each, or by side passages leading through the courts. In the former case the corridor opens out upon a garden. In towns, where the houses are of one storey and the lots irregular in their shape, there is more diversity in the arrangement and size of the rooms. In the country establishments of the wealthy families it is customary to provide for the increase of members by marriage, &c., by adding additional courts and buildings.

We have already noted that "private" houses are not allowed to overtop any neighbouring temples. An exception to this rule is made in the case of pawnbrokers, who are permitted to build square towers of four or five storeys, the goods received being stored on the upper floors as a better protection against thieves. In nearly all disturbances the pawnbrokers' shops are the first to be attacked and, if possible, looted by the mob. The doorways are defended by stout posts, their lower ends dropping into mortice holes cut in the stone threshold and locked by an ingenious arrangement above.

Glass, as already noted, is unknown for windows in the interior, and in place of it oyster shells are employed (*Placuna placenta*), being scarcely inferior to ground glass in transparency.

The process of building strikes the European spectator as somewhat curious. The first thing is to raise a complete

bamboo scaffolding, which supports a mat roof and thus insure immunity from rain or sun to the workmen. The peculiar value of the bamboo when subjected to a perpendicular strain only is well known. The lengths are tied together with rattan and the scaffolding thus made is as strong and useful as the more elaborate construction of poles and rope used in western countries. The next proceeding is to put in the uprights, and these once in place and sufficiently braced, the roof is at once proceeded with. The walls are therefore built up to the roof. One of the most valuable materials known to the native builder is chunam. It consists simply of lime and earth (or fine sand and gravel) thoroughly incorporated with sufficient water and then beaten to a level with a hand-mall of special shape. This is the universal substitute for plank flooring and its adoption by our own builders would in many cases be beneficial. It is easy to mix and work, and hardens quickly and satisfactorily.

The tools and other adjuncts used by the Chinese bricklayer or mason resemble our own, differing only in shape and size. The hod is replaced by the basket. The average wages of a workman are 20 cents (about 10d.) per day.

It should be noted that underground house drains are unknown in China. All offensive matter is removed every morning by men who are not paid, but pay for, the contribution to the manure heap thus obtained, which they dispose of at fair rates to gardeners and cultivators.

The comparative immunity from epidemic disease enjoyed by the Chinese generally is probably due to this system of removing what would otherwise pass into cesspools and drains. One other point is, in conclusion, worth passing notice. The architect, like the painter or author, however distinguished in his own line, neither claims or receives any special recognition in consequence. Scarcely a single name has been handed down to an admiring posterity, while at the present day the most ingenious builder fails to secure even passing honour. This fact, perhaps, is not the least curious in connection with "The Builder's Art in China."

ST. SAVIOUR'S, SOUTHWARK.

THE fund for the restoration of the collegiate church of St. Saviour's, Southwark, has now reached nearly 33,000*l.*, among the latest contributions being 100 guineas from Lord Burton. In addition to the "In Memoriam" window given a few months since by Mr. H. T. Withers at a cost of 635*l.*, the restoration committee have just accepted another munificent offer by Mr. Frederick Wigan to restore the south transept window, which faces the South-Eastern Railway and is the largest window in the church. It is intended to restore the tracery of the original design, and also to restore the original characteristics of the edifice at this point. The absence of veneration for the antiquities of the church in past times had led, among many other disfigurements and injuries to the fabric, to the cutting away of the stone pillar supporting the centre of an arch in the wall below this window, in order to make a central entrance into the transept here. This doorway is now to be closed, the pillar restored, and the earlier side doorway reopened. The cost of the window and the structural alterations will probably exceed 2,000*l.* Everywhere in the nave and transept the work of restoration is being carried out in a thoroughly conservative spirit. Not a stone has been displaced where it could be helped, the new work being laced into the old with the utmost care, and every vestige of the old church, whether archway, marble column, loose stone, or ornament, is being utilised in the most faithful manner. Thus the old Norman or prior's doorway at the east end of the north aisle, leading to the old cloisters on the north side, has been carefully preserved without any attempt at restoration, together with the monks' entrance to the cloisters through the north wall and an arched recess, probably originally occupied by a recumbent figure. A pit has been formed in front of the monks' entrance inside the building in order to show the entire height of the door, as the sill of the doorway is some 2 feet below the level of the new nave, the present level being the same as that of the thirteenth-century floor. The floor of the old cloisters was evidently lower than the sill of the doorway referred to, and was reached by steps which began on the inside of the building. In the course of removing the back casing to the original Norman work in the west wall of the transept, a holy-water stoup nearly complete was found close by the prior's doorway. The old Norman walling and buttress also revealed the marks on the stone of the fire which burnt the nave in 1207. Inside the north transept on the north wall was found a fourteenth-century aumbry inserted into the Norman wall. Several other pieces of old work at the west end of the nave which were found are also being carefully treated. In the course of recent excavations for a new buttress on the west wall of the north transept a stone coffin with the remains of a skeleton was found 6 feet below the ground. About 5 feet away a portion of a stone lid was discovered with the top downwards. The lid on being examined was found to

be of Purbeck marble and moulded on the edge. It had also a raised Latin cross, link-shape, with the sun, moon and stars in the quarter. An evidence of the desire of the committee to carry out the work of restoration in the most thorough manner is shown in the provision of a recess on the inside of the wall of the north aisle of the nave, above the spot where the poet Gower lies buried, so as to allow of the replacing of the massive monument to his memory which originally stood there, but had been removed to the transept. A number of loose carved wooden bosses, which for years had been lying in the lady-chapel, are to be utilised in the restoration of the ceiling of the tower. Another very interesting discovery has just been made on excavating below the floor of the vestry for the proposed warming arrangements, viz. the remains of the ancient Norman apse. The work of restoration is now in an advanced stage. The stone-groined vaulting of the aisles is all finished, and presents a remarkably beautiful appearance, and will compare with anything to be found in the old work. The vaulting of the nave is now in progress, but it will necessarily be some time before the church will be ready for reopening. In the meantime certain questions as to the future of St. Saviour's are under consideration. There is a feeling in favour of transforming the church into a cathedral for South London, and steps are being taken to this end. Its dimensions are regarded as adequate for such a purpose, St. Saviour's being about the same size as Ely Cathedral.

THE VICTORIA BUILDINGS JOHANNESBURG.

THE following letter from Mr. Lennox Canning has appeared in the *Johannesburg Star* :—

The evidence recently given in the suit of the Johannesburg Board of Executors *v.* The Victoria Buildings Company has aroused considerable public interest about architects, builders and buildings.

My reason for troubling you is not to comment upon that evidence at present, as the action is still undecided, but to call public attention to a parallel case with which my name has been coupled. I also invite the attention of the official whose duty it is to inspect the buildings of the town.

When I was appointed professional adviser to the Johannesburg Office and Safe Deposit Company in London I laid from time to time certain schemes before the board for erecting a block of buildings upon the site of Green's Chambers, among which was a basement to be used for a safe deposit. There was also a proposal to build thereunder a restaurant.

I, however, informed the board that, knowing the nature by long experience of the subsoil of Johannesburg, and having been the architect both of the structure now known as Robinson's Buildings and the Barnato block, it would be very injudicious to excavate adjacent to the foundations of the adjoining buildings. I explained that at the time these structures were built good materials were not to be had, and that the soil was soft and treacherous. I admitted that it was quite possible to excavate not only to any depth, right up to or even under these old foundations if the work was carried out in a scientific manner with proper shoring, needling and underpinning, but—and I lay particular stress upon this point—I urged the board not to undertake such excavation, as it would not only be costly, but would involve some risk, and settlements in the walls of the adjoining building might, in spite of all precautions, occur. The idea of excavating the greater part or the whole of the site to a depth of some 10 feet, as is now being done, was therefore abandoned, and only a small basement provided for a safe deposit. The contract for this work was signed in London at the end of February last. The excavation thus provided was 10 feet away from the walls of the adjoining building at the nearest point, and the greater part of it was 14 feet away. This security-room was projected at a time when it was supposed a similar but more extensive scheme, which I designed in 1889 for the Johannesburg Estate Company, had been abandoned.

I believe the architects at Johannesburg, with one singular exception, are agreed that it is an axiom when a building is razed which adjoins and supports another, that it is not only prudent but necessary to shore up, *i.e.* to place eight strong artificial supports in place of those which have been removed by pulling down the building in question, and I should think the common sense of the public itself, in spite of any muddled balderdash that may be written to the contrary, will need little educating on this point.

These shores or supports may in some cases not be necessary, especially when, for instance, the adjoining structures are not very high, or are built of timber and corrugated iron. But in the case of Robinson's and Barnato's Buildings, both heavy structures, I conceive that as an excavation some 10 feet deep, exposed to the heavy rains of the last few weeks, has been dug adjacent to the exposed, unplastered brickwork forming the bases of the adjoining walls, well-nigh from end to

end of the site, it was, to put it mildly, a serious oversight to omit placing the proper shores which I had provided for in my plans. The consequences of this omission are obvious to anybody. The east wall of Robinson's Buildings has settled, although it rests on a solid foundation of Portland cement concrete, and the whole building is in jeopardy. The western walls also of Barnato Buildings, particularly where the brickwork has been exposed, have also settled since the razing of Green's Chambers and the formation of the excavations.

I am extremely desirous that it should be known that I made special provision in my specification for shoring up between Barnato Buildings and Robinson's Buildings, and if this had been done Mr. J. B. Robinson would have had no need to riddle his building with bolts after painting it so prettily. It is the clear duty, in my opinion, of the official who has charge of the buildings of the town to insist upon horizontal shores being placed between the two buildings.

In conclusion, let me state that the subject of "shoring" forms a special paper in the Institute examination; it is also one of the most stringent provisions of the London Metropolitan Buildings Act. No building standing between two others is ever razed in the metropolitan area without horizontal shores being inserted; and if they are deemed necessary where materials are good, how much more needful are they where materials are bad, and where the climate alone, apart from any other consideration, renders their use imperative?

GENERAL.

The Manchester Society of Architects at a meeting on Tuesday passed the following resolution:—"That the Council, having perused the copies of the correspondence which has taken place between Messrs. Woodhouse & Willoughby and the authorities of the St. Helens Technical School, regret that, contrary to the assessor's award, the committee should have decided to allow the authors of the second premiated design to carry out the work in preference to the authors of the first, a decision which they consider to be opposed to the true spirit of competitions."

Mr. J. W. Trounson, architect, Penzance, has planned extensive alterations and additions for the High Street Bible Chapel, Penzance. The work has been carried out at a cost of 1,000*l.*, and the edifice was reopened on the 19th inst.

Mr. C. E. Oliver, F.S.I., on Wednesday read a paper entitled "Notes on New Zealand Timbers" at the meeting of the Northern Architectural Association, in the Art Gallery, Newcastle-on-Tyne.

The Art Gallery Committee, Leeds, have received nearly 600 pictures for the forthcoming Spring Exhibition. Owing to want of space about 200 only could be selected.

The Manchester Art Gallery was reopened on Monday, after rearranging and rehanging of the permanent collection. Among new pictures are *The Lighthouse*, by Mr. Stanhope Forbes, A.R.A., and Mr. Frederick Smallman's gift, *The Water of the Nile*, by Mr. John Goodall, R.A. Four galleries on the north side of the building have been reserved for the annual Spring Exhibition of the works of members and associates of the Manchester Academy of Fine Arts.

The Council of the Royal Scottish Water-Colour Society have agreed to place lady members on the same footing as gentlemen. Ladies therefore will henceforth be able to attend meetings and be eligible as members of Council.

Mr. William Holyoake, who served as curator in the Academy Schools, died last week, in his sixtieth year, and was buried on Saturday at Highgate Cemetery.

Mr. W. Kenrick, M.P., has given a painting, *Sweet-water Meadows of the West*, by Mr. J. W. North, A.R.A., to the Birmingham Art Gallery, and Mr. J. C. Holder has given a study by Sir F. Leighton, P.R.A., for his large painting, *The Sea Gave up its Dead*.

Mr. Alderman Milling, the chairman of the paving and sewerage committee of the Manchester City Council, stated on Wednesday that the old township of Manchester was 1,646 acres, while the area to day was 12,788 acres. The Corporation had 622 miles of streets to sewer, 7,734,000 square yards of carriage-ways to pave and keep in repair, and 2,812,000 square yards of footpaths to flag and keep in order. At the present time they paid about 1,000*l.* per week in workmen's wages, and the number of men employed in the paving department is 650, and in the sewerage department 300, making a total of 950.

The Partnership of Messrs. Seward & Thomas, architects, Cardiff, expired by effluxion of time on the 31st ult., and it has been mutually arranged by the former partners that they will carry on separate businesses under the respective names of Edwin Seward and George Thomas. Mr. W. P. James, who died in 1885, was the founder of the business.

The Architect.

THE WEEK.

THERE have been so many failures in connection with the Chicago Exhibition, nobody can be surprised at the unprecedented delay in announcing the awards. No list has yet been issued, and it seems quite uncertain when one will appear. Many awards, it is true, have been announced, but none have as yet been officially confirmed. Sir HENRY WOOD has, however, at different times received information, from which it appears that about 1,400 awards have been made in the British section. Of these 836 were in the industrial departments of the Exhibition, and were divided among 449 exhibitors. The total number of industrial exhibitors was 597. Of 501 exhibitors in the Fine Arts Department, 132 received an award; of 1,138 exhibitors in the Women's Work Section, 173 received among them 229 medals; 180 awards went to Indian manufacturers represented at Chicago either independently or in the Indian Pavilion; 54 awards went for British exhibits not under the jurisdiction of the Royal Commission. The lists from which the above statements are collected, it is understood, are liable to modification, so the figures must only be regarded as approximative. In Paris, in 1889, 926 awards were distributed among 1,017 exhibitors.

THE annual meeting of the National Association of Master Builders of Great Britain was held at the North Staffordshire Railway Hotel, Stoke, Staffordshire, on Tuesday. Representatives attended from London, Liverpool, Manchester, Birmingham, Derby, Leeds, Bristol, Bolton, Hull, Northampton, Newcastle, Shrewsbury, Plymouth, Kidderminster, &c. Alderman JOHN BOWEN (Birmingham) was unanimously elected president for the ensuing year; Messrs. THOMAS F. RIDER (London) and J. STEPHENSON (Liverpool), vice-presidents; C. W. F. GREEN (Liverpool), hon. treasurer; W. H. SMITH (Northampton), hon. auditor; and J. A. S. HASSALL (Liverpool), secretary, in place of Mr. W. KNOX, deceased.

AMONG the papers to be read before the Society of Architects during the next few months we may mention the Rev. Canon G. F. BROWNE'S, on "Early Christian Art in England," and those on "Freemasonry in Architecture," by Mr. D. FEARON RANKING, M.A., LL.D., and "Iron-work: Mediæval and Modern," by Mr. GARDNER. These papers will be illustrated by many lantern slides. Mr. ELLIS MARSLAND will contribute a paper on the London County Council's new Streets and Buildings Bill on February 13, and this should bring together a large meeting.

THE annual report of the Archæological Section of the Midland Institute announces that there has been a diminution of nine in the number of members, the total now being 219, as compared with 228 at the corresponding period of last year. The usual number of papers have been read during the year, and have been much appreciated by the members attending the meetings. The attendance, however, still remains comparatively small, and the committee hope that more members will avail themselves of this privilege during the forthcoming year. The papers have been illustrated by drawings, specimens, or lantern slides, and the hearty thanks of the section are due to the readers for the time and trouble they have devoted to their preparation. Among the objects of archæological value which the section has been successful in preserving from destruction is the bridge at Bradnock's Marsh, Hampton-in-Arden. The bridge, which narrowly escaped total destruction last year, was in a decaying condition, but has now, by the generosity of members of the section, been satisfactorily repaired. The committee will be glad if members will inform them if they hear of any important antiquarian relic in danger of damage or destruction. With regard to finance, there is a balance of 67*l.* 1*s.* 10*d.* on the general account, as compared with 55*l.* 4*s.* 2*d.* at the close of last year. The balance in hand on the combined account is 19*l.* less than the balance of last year.

In the annual report of the Nottinghamshire and Midland Merchants and Traders' Association are many references to the business of the past year. Among other matters, it refers to the attempted legislation on building societies. When the Bill was before Parliament last session the directors communicated their views to several of the most active members of Parliament with a view to improving the laws relating to building societies. The view taken was that many of the best of the building societies were doing their work efficiently, were supplying a public want, and that the less interference with their operations the better, except so far as might be necessary to the prevention of wrongdoing on the part of other societies not so well conducted. The societies holding periodical ballots they regarded as involving a dangerous tendency, introducing chances into business transactions, and often leading to questionable results. Particulars were given of certain societies, professedly carried on for the benefit of the working classes, but with operations more than doubtful. On the other hand, the provisions of some of the Bills introduced—for four Bills were so introduced—would, if carried, have been fatal to the best interests of the Societies. The Bills, having been referred to a Select Committee, contained, as reported, valuable provisions tending to prevent fraud and to give solidity without unduly restricting the operations of good and useful Societies. A petition to this effect was presented. The Government, however, withdrew their Bill in September.

DURING several years KELLY & Co., Limited, have made the building trades, the engineers and iron and metal trades their debtors by the excellent directories they have published. It is difficult to estimate the advantages which have been derived from such a manifestation of names. The labour, however, has been enormous and costly. It is only in an establishment where the most perfect organisation prevailed that the inquiries which were needed, the classification and production could be accomplished. The strength of the trades at once becomes apparent from the pages. The firm are always anxious to perfect their work, and from time to time new editions appear which are representative of business up to the time of publication. The name of KELLY & Co., Limited, is a guarantee for accuracy, and the new editions of the two directories relating to the building trades and the engineers and iron and metal trades appear to be completed with the exactitude which has gained reputation for the firm.

THE second of the "Portfolio Monographs" is devoted to Malta, a subject which is well deserving of ample treatment. The author, the Rev. W. K. R. BEDFORD, describes the place as if he were acquainted with every building in it, and excellent illustrations are given of the most picturesque parts. In the churches there is so much sculptured and painted detail it is no wonder they have been rarely illustrated. Photography has been utilised for Mr. BEDFORD'S monograph, and in consequence more justice has been done to the subjects than was the case hitherto. Great care is taken in the narration of the history of the Hospitallers, and the account of the siege by the Turks is of absorbing interest. The new series is the result of a happy thought, and literature and art of a high class have been rarely combined on such economical terms.

THE Council of the Glasgow Institute of Architects are watchful for the interests of architects in the West of Scotland. At the last meeting it was reported that efforts were made to regularise the competitions for the Kirkcaldy Halls and the Govan Congregational Church; the correspondence on these subjects was read and approved by the meeting. The secretary read a letter which he had received from the clerk of the Police Commissioners, stating that the original drawings of the proposed new bridges over the Clyde had been departed from, but that the Institute's suggestions as to the public exhibition of the drawings would be kept in view when new designs had been fixed upon. Attention was called to the new police offices at present being erected on the south side, and the secretary was instructed to call the attention of the Committee on Public Architecture to these buildings.

THE PUBLIC LIFE OF WORKS OF ART IN GREECE.

THE ancient story which has given rise to the saying about the wisdom of a cobbler sticking to his last has been commonly interpreted as if it merely exemplified the worthlessness of a critic's omniscience. The sculptor was justified in accepting information about the inaccuracy of the foot-gear he represented as part of his model, but was to be excused when he rebuked the expert for meddling with other parts of the work. The story is still more valuable as evidence of the privilege which the Greeks—and especially the Athenians—exercised of imagining themselves to be givers of commissions for works of art, and scrutinising statues and pictures as if they were to pay for them. There are many anecdotes preserved which suggest the strength and weakness of the general criticism. One relates to POLYCLETUS. He produced two statues relating to the same subject. In one of them he carried out, as well as he could, all the suggestions for its improvement which were offered by the crowd. The other he preserved unaltered, and when the two were placed side by side, as a matter of course it alone secured admiration. The sculptor pointed the moral by explaining to his fellow-citizens that the successful work was his own, while its despised companion was theirs. It was only a favourite artist who could dare to give a lesson to the Athenians of that sort. Their admiration for his work is revealed by another story from ÆLIAN, which tells us that when POLYCLETUS was named as the most suitable sculptor to execute a proposed statue, the donor would not agree, for, said he, if POLYCLETUS carves the figure, it alone will be applauded, and my generosity will be ignored.

It is not necessary for us to attempt an anecdotic history of Greek art; we merely refer to those cases because they show how prevalent was the belief that works of art were common property, and to justify the selection of the title for this article. Like the statesmen, pictures, statues and buildings possessed a public life.

The origin of a custom which, as we shall see, limited the extent of a man's possession in respect of certain classes of works of art, especially the highest class of sculpture, can easily be imagined. In Greece there was a belief in local deities. Not only towns and districts claimed to be under the special protection of a god or goddess, but certain groves, streams, hills, &c., were also supposed to be no less distinguished. The figure or the symbol of the deity would consequently appear as something sacred in the eyes of votaries. We learn that in an advanced period STILPO, a philosopher, was banished for denying the divinity of a statue of ATHENA, which came from the hands of PHIDIAS. To carry off such a figure was supposed to be an unpardonable sin, not only for the raiders but for their countrymen. Under no circumstances would a statue of a deity be sold. The offer was made to the people of Cnidus that the levy on the town would not be inflicted if the *Venus* of PRAXITELES were surrendered, but they rejected the proposal. The confidence in a Palladium of the kind outlasted the downfall of Greece. It was found in other countries, and the commotion which FLAUBERT, in his "Salammbô," depicts as occurring in Carthage when the zaimph or mantle of the goddess TANIT was stolen is borne out by many circumstances in the history of Greece, Rome and other places. For an individual to possess a statue of the protecting deity of a town or district was therefore to run risks which could not be escaped by presenting the evidence which was acceptable for other descriptions of property.

When polytheism was allowed to have ample expression in art, it was inevitable that for a long period at least the figures of the deities should be esteemed as being of too grand a nature to become a private possession. During the week we have had in our law courts grave discussions among judges and lawyers as to whether the portrait of an individual who had gained notoriety could be introduced in an exhibition without his sanction. To some it was an invasion of the sanctity of private life. The Greeks were even more rigorous in respecting the sacredness that was associated with statues of the deities. The only fitting sites for them were temples or public places.

The relation in which the Greeks supposed themselves to stand before the gods and goddesses was unique. The

people considered there could be nothing on the earth or beyond it which was greater or more beautiful than themselves. When, therefore, they made the deities assume the forms of comely Greeks, they had no doubt that by doing so they were rendering acts of homage. That the old symbol worship was not set aside throughout Greece when noble sculpture was attainable is evident when we learn that TIRUS, on his visit to the Temple of Venus in Paphos, found, instead of a beautiful statue of the goddess, a conical block which was the object of reverence. But, in spite of those exceptions, there can be little doubt that the Greek idea was expressed by HERODOTUS when he wondered how the Persians could have a worship from which anthropomorphism was absent:—"They make no images and do not build altars or temples; they charge those with folly who do such things, for, as I conjecture, they imagine the gods to be altogether different in nature from men, contrary to the belief of the Greeks." Polytheism was less divine than the immaterial power of the Easterns, but it exercised a marvellous influence in advancing the sculptor's art among the Greeks. If the poets considered it was bad taste to allow a god to take part in an unworthy action, the sculptors were no less bound to represent gods and goddesses in the most perfect forms that could be devised, while respecting the traditional characteristics. To the sculptors the deities were not abstractions like Abundance, Temperance, Commerce, Art, Hope, Britannia that once ruled the waves, or other subjects which are used to adorn English buildings, but real beings, whose bodily and mental attributes were familiar to all people. It was no effort for a Greek to imagine that he would be able to recognise one of the dwellers in Olympus unless a disguise was adopted. The sculptor gladly utilised the popular belief, and made it appear more certain. The devotees helped the artist, who in return embodied their thoughts.

It is true; there were types which had to be adopted reverentially; but what a variety of subjects were offered, without going beyond Olympus. To render the traditional characteristics of the divine beings was to express different combinations of majesty and beauty. They could not be supposed to be always dwelling in seclusion; they shared at times an active life, and were not too exalted for the companionship of animals, so that a MYRON need not be prevented from co-operation in the representation of the divinities. Then, as if to diminish the gap between the highest and lowest life for the benefit of art, fauns and satyrs, centaurs, &c., were made part of mythology. There was, consequently, scope for the display of the most varied talents. Let any one recall all that was necessary to represent a *Triumph of Bacchus* adequately; how skill in creating not only youths and maidens, but ancient votaries of the god, wild beings from the forest, frenzied bacchantes, leopards, fruits and flowers was required for the completeness of the composition, and it will be evident that mythological subjects demanded the highest gifts of the artist. If we remember, too, that a painter or sculptor was subjected to a sort of microscopic criticism of details by men who were as exacting as the nameless but immortal cobbler, the success of the ancient artists will appear less remarkable. They were kept up to a high standard because their works were not intended to be placed in secluded cabinets for the delight of a few admirers, but had to be judged worthy to be seen in public places by gods and men.

How Bacchic processions and similar rites could be accepted as religious ceremonies we need not inquire. The "language of the chariots" employed in those outings could not be considered as prayers or pious exclamations, if tested by a Christian standard. Some say the deities were only figurative of the phenomena of nature; perhaps it would be nearer the truth to say they were accepted as grand seigneurs, whose association with a place brought it honour—who were able to be protectors, and if becomingly treated would be glad to show their power. The universe in those days was considered as being limited in extent, and if the gods did not busy themselves in human affairs how was their activity to be exercised? Accordingly, when NEPTUNE and MINERVA fell out, the quarrel was determined by the protection of whatever was most advantageous for the Athenian people, and the goddess won by creating the olive. It is no wonder men thought of

MINERVA as surpassing the citizens in love of Athens, and in various degrees the rest of the Immortals were supposed to be associated with the city. About the value of a Greek who had tried to serve his State there might be differences of opinion, but all were sure to agree about the worth of the feeling for Greece—the sublimated affection or patriotism which animated the Olympians. Greece could hardly be said to possess a priestly caste; yet from the interest which was supposed to be taken in the people by the gods the temples became as it were the centres of national life. The public games and competitions were connected with them as well as the festivals and assemblies which were supposed to be religious. Once they came under divine patronage all classes of people became equal, and the crown of wild olive, which conferred so much dignity on the possessor, could be carried off by a water-carrier or a tanner from the son of a general or statesman. Polytheism was therefore an efficient aid to union, especially among a people in whom selfishness was of remarkable power, and the rulers were not slow to perceive that every temple, statue and painting devoted to any of the favourite gods became persuasive of public interests.

It was agreeable to be assured that a divine being was enamoured of a particular town; but occasions arose, as when alliances were necessary, in which it became requisite to assume a broader and more generous manner of looking down on Greece. The Amphictyonic Councils were in consequence placed under the protection of deities, who were not commonly supposed to be diffusive in affection. NEPTUNE protected them in Bœotia, JUNO in Argolis, APOLLO in Delos, and so on. In return the oath was taken, whenever there was a meeting, that if any insult were offered to a god by an attack on his temple, all the cities and districts combined in the league were to unite in order to avenge the crime. In that way, by promoting union, the gods became representative of federalism, as at other times they could be taken as upholding a spirit that was almost parochial in its limitation. The inconsistency only made them more dear to the Greeks, for it suggested a common nature.

As a consequence of the elasticity of the theology, it became impossible to discriminate between religion and good citizenship. The raising of temples or statues was a patriotic act. Men were willing to suffer sacrifices in order to expend wealth on art, and hence were often saved from concentrating their thoughts on their own petty interests. The old Greeks present as puzzling contrasts, as we can still see in a journey through their country, and thus we find it recorded that men who seemed ready to betray their cities to gratify revenge, on other occasions were ready to act as if they were only a part of an organised body.

The appearance of Athens was by itself a testimony to the extent to which general interests could be pushed. From an early period it had its faithful inhabitants over whom it exercised a fascination. Did not PLATO, when his doctors ordered him to leave the city if he valued his life, declare that not even Mount Athos and the hope of a longer life could tempt him to remove from his Lyceum? Yet, apparently Athens was not a desirable place to reside in. When a description of the tumble-down condition of Gallipoli appeared some years ago, Dr. NEWMAN (afterwards Cardinal) came to the conclusion that it must have resembled Athens in its palmy days. He said:—"Learned writers assure us distinctly that the houses of Athens were for the most part small and mean; that the streets were crooked and narrow; that the upper storeys projected over the roadway; and that staircases, balustrades and doors that opened outwards obstructed it. I do not doubt at all, though history is silent, that the roadway was jolting to carriages, and all but impassable, and that it was traversed by drains as freely as any Turkish town now. Athens seems in these respects to have been below the average cities of its time. A stranger, says an ancient, might doubt, on the sudden view, if really he saw Athens." There does not appear to be any distortion in the description. Who does not remember the saying of EUCRATES about the rickety condition of the house in which he was dining, "We ought to assume the attitudes of caryatides here, our left hands being held up to support the walls"? Or who does not recall what XENOPHON says about the removal from Athens to a country place being longed for by

children, and found delightful by their mother? While the houses were uncomfortable and insalubrious, the public places of Athens were beautiful. CIMON laid out a fortune in building noble porticoes, in forming groves, gardens and fountains for enjoyment. PERICLES expended the money he could acquire in the adornment of the city. Some years afterwards DEMOSTHENES could refer to the difference between the public buildings and the ordinary habitations as evidence of the public spirit of the old Athenians. While the public edifices could not be excelled, the house of ARISTIDES or MILTIADES was not to be distinguished from those of ordinary citizens. According to the orator, some of his contemporaries had made their own houses much more magnificent than the public edifices, and a more sure sign of degradation was not to be found. We see the same theory of duty manifesting itself in PLUTARCH when he wrote in scorn about the splendour of the villas of the Roman LUCULLUS:—"Among frivolous amusements I cannot but reckon his sumptuous villas, walks and baths, and still more so the paintings, statues and other works of art which he collected at an immense expense, idly squandering away upon them the vast fortune which he had amassed in the wars." The biographer might be able to realise the luxury which was gratified by having paintings, cups and jewellery in a man's chamber, but noble buildings and statuary appeared to him to be deprived of their best qualities when they were not exposed for the delight of rich and poor. PLUTARCH had recorded and heard of too many cases in which works in marble and bronze were created out of the public levies, or by means of the money of men who were anxious to display their citizenship, for him to believe that they could subserve what was known at a later time as connoisseurship.

In our time the individual is supreme, and art corresponds with the idiosyncrasy of the artist or the patron. To please the crowd it is supposed to be necessary to produce theatrical or unrefined effects. The Greeks associated not only power but every good gift with the multitude. The Cyclops were inferior in HOMER's eyes because they were not accustomed to meet in assemblies. The mere possession of speech, according to ARISTOTLE, was a sign that men were to live not only in families but in political parties. To be deprived of a citadel, agora, gymnasium, theatre, fountain and other places where men could congregate would be, according to others, to want the things which made life endurable. The buildings and the statues were, therefore, accepted as being dedicated to the highest uses, and it is no wonder they were subjected to severe criticism whenever it was supposed the artists were not faithful to the inspirations which the gods bestowed for the benefit of the citizens who were under their protection.

ADAM ARCHITECTURE IN LONDON.*

By PERCY FITZGERALD, M.A., F.S.A.

THERE are a few notable architects who have left their mark, as it were, upon this great city of ours, and whose work is to be recognised almost at a glance; such as Wren and his pupils, Sir W. Chambers, Sir John Soane, and Nash, the designer of the Regent's Park plaster terraces and Regent Street, to say nothing of the modern Queen Anne fashions. But the architect most remarkable for a distinctly original style was assuredly Robert Adam and his brethren. And it is interesting that over a hundred years after his death we should be gathered here to-night to consider his works in this spacious building, designed by him in this large quarter of the Adelphi, also erected by him. Even the very ground upon which I stand was raised by him high in the air to the level of the Strand, from the low-lying shore of the Thames.

The Adams were a remarkable family. The father was a fashionable architect, and built a vast number of noblemen's mansions all over Scotland, which show good sense and excellent effect. His four sons—after whom the streets about us here are named, Robert, John, James and William—were architects also, though one only, Robert, was the genius. It is remarkable that a single family should have thus engrossed the work of almost an entire century—the father during the first half, the sons during the last.

Robert Adam was a clever, well-cultivated, aspiring young

* A paper read before the Applied Art Section of the Society of Arts on Tuesday, January 30, and published in the *Society of Arts Journal*.

man, who received a University education. He had good connections and high patronage, and could have at once stepped into business, but he determined first to thoroughly cultivate his talent and form his style. In 1757, nearly 140 years ago, he set off on the grand tour, visiting Rome and other Italian cities. But the old remains—amphitheatres, temples, baths, forums, and the rest—did not supply him with what he wanted. What he sought was some monument of a residential kind, which would furnish him with ideas as to how the ancients treated their domestic architecture, and whose system he might adapt to the mansions of the opulent lords at home. At Rome he had been struck by the arrangement and ornamentation of the Baths of Titus and Diocletian, and this suggested to him a direction for his studies. He had learned that in Dalmatia, on the coast opposite Venice, there was a very remarkable and striking building of this kind—the Palace of Diocletian, in the Bay of Spalato. This he determined to visit and study thoroughly. Accordingly he took with him some artists, with an ingenious French architect called Clerisseau, and set sail for Dalmatia.

There is really much romance and even poetry associated with this place and the story of it. The Emperor Diocletian, when he abdicated, built himself a vast palace here, the sight of which almost confounds the traveller. It was an enormous pile some 600 feet square, containing temples, and halls, and gates, and arcades. So well preserved is the city through all its vicissitudes, that the great Temple of Jupiter is, to this hour, used with little alteration as the cathedral; while the Temple of Æsculapius serves as a baptistery. It has fortunately been preserved in excellent condition, owing to the fact that the inhabitants have built their houses in the palace itself, and utilised the walls for their own dwellings. This fascinating monument has been visited by many travellers, both French and English, such as the late Lady Strangford, Sir Gordon Williams, and Mr. Jackson, the architect, who all seem to have felt the charm of the place; and we can conceive the feelings of the aspiring young architect as he sailed into that Dalmatian bay. But the most striking feature of the whole, and which most impressed the imagination of the young architect, was the great terrace on the sea—a most picturesque and astonishing thing, which must have inspired any architect of true feeling. It suggested to him another monumental work which he carried out on his return. He remained here nearly two months, studying and making the most careful drawings, until he had thoroughly permeated himself with the entire spirit of the place. The result we have in a magnificent atlas folio, which was issued under the highest patronage, not of England only, but of all Europe.

So little is known nowadays of Adam's work, that I fancy the average superficially informed man in the street if asked about it would reply, "Yes; I know Portland Place, and all that; and there is the Adelphi." Yet it will indeed hardly be credited what an amount of Adam's work is to be found, not in London alone, but all over the three kingdoms. I have taken great pains and made careful search, and have been able to compile the following catalogue of his works, the first, I fancy, that has been made:—

The Adelphi; Portland Place, with Mansfield Street; a portion of Harley Street; Stratford Place, in Oxford Street; Finsbury Square; portions of Dover Street and Grafton Street; Spring Gardens; one side of Portman Square; Portman Street; Hamilton Place; George Street, Westminster; Bedford Square; Gower Street; Cumberland Place; Seymour Street; Bryanston Square; mansions in Whitehall; Gwdyr House and, possibly, Whitehall Place; houses in Berkeley Square and Hart Street; the long terraces at Kensington known as Upper and Lower Phillimore Place; Fitzroy Square; York Place; houses in Weymouth Street; in Devonshire Street; in Manchester Square; the Duke of Cambridge's house, Park Lane; houses in Soho Square; in Bruton Street and in Russell Square; terraces in the Walworth and Old Kent Roads; and at Kennington. Besides a number of buildings which have escaped search, or which have been swept away.

Thus much for streets. His mansions in and about London, and in the provinces, are many. There are:—Montagu House, in Portman Square; Harewood House, in Hanover Square; the Admiralty Screen, Whitehall; a wing of Northumberland House (now pulled down); Lansdowne House, Berkeley Square; the great building of the Sunday School Society in Serjeants' Inn; mansions in St. James's Square; Chandos House; Foley House; Boodle's Club, St. James's Street; "British" Coffee House, now destroyed; Coutts's Bank in the Strand, and a large clubhouse in Piccadilly.

Outside London there are Kenwood, Lord Mansfield's mansion at Hampstead; Osterley House, Lord Jersey's fine mansion at Brentford; Sion House at Isleworth, restored and decorated by him; a fine house in Conduit Street, opposite Lewis & Allenby's; additions to the United Service Institution; Lord Fife's house at Whitehall, decorated by him; a Gothic ceiling, designed for Horace Walpole, no doubt for

Strawberry Hill. During his life there was a proposal to re-erect the Houses of Parliament, and he furnished some elaborate designs in the conventional Greek style; a central portico with wings.

About the middle of last century most of the noblemen and gentry were busy building mansions and castles, and Adam was almost invariably called in. In Scotland he was largely employed, and Edinburgh can boast numbers of public buildings, squares and terraces from his hand. There are also fine mansions in Dublin and Bath of his work. Nearly all the great towns, such as Glasgow and Newcastle, can boast some fine specimens of his work. At the time of his death he had actually in hand no less than eight public buildings and twenty-five great mansions, an amount of commissions enough to make the mouth of even a reasonable architect of our times water. It is altogether an astounding record of work.

At this point we may pause to ask what are the principles of this Adam's style, which strikes us as something apart from all others. Most of us will recognise an Adam front, or an Adam doorway and window, or Adam furniture, chimneypiece, grate, &c., the principles are carried out so logically. There are many I know who object to the style; it has been called tame, prim, mincing and insipid, but this arises from its thorough correctness and propriety. Elmes, father of the architect of St. George's Hall, speaks of "the finnickin' finish" of his work, and "the depraved school of the lower and middle empire" which he introduced. The late Mr. Fergusson says "his style was of the thinnest and most tawdry class." But he concedes its originality and correctness, which are great merits, and to some of his works gives unstinted praise. Perfect correctness and reserve will always appear prim and "finnickin'" to those who are accustomed to extravagance.

The first merit of Adam's style we trace to an exquisite sense of proportion. In our day this principle is rather set aside. We cannot blame our architects for this, for we live in a highly utilitarian age, and what is required is the utmost accommodation the ground will admit of. Little attention is given now to the beautiful proportions of the column, which, in Adam's hands, had a special grace. It is not known that the chief columns in London, that in Trafalgar Square and the Duke of York's, are both shorter by some 20 or 30 feet than they ought to be, owing to the funds having failed. The Victoria Tower is also shorter by a whole storey than it should be, with the result that it seems squat and stunted. Even in the common doorways and porticoes we see this inattention to the graces of proportion. An ordinary Grosvenor Square or Brook Street portico is a gross, sprawling thing, made by rule of thumb, out of all proportion to the door and to the house itself. A modern London portico is usually made to discharge the double duty of a portico and balcony—always a mean and ineffectual shift. A balcony is a fine thing, as we can see from the Venetian patterns, and a portico is a fine and attractive thing. But this hybrid balcony-portico destroys the function of each, for the balcony ceases to be a balcony, and becomes really only the top of the portico, while the latter has to be raised high, so as to reach the level of the window, and fails to give shelter. Such is Nemesis. In Adam's doorways there is a placid grace and reserve, a perfect refinement of treatment, not obtrusive, and yet asserting itself, with the delicate ornamentation of the garlands. The whole is most pleasing. The portico of Chandos House has the same airiness and grace.

I have often speculated why it is that a column out of proportion should seem shorter or taller than it really is. I fancy the reason is that the eye that is trained to correct the proportion expects the column to be higher or thicker, and supplies the portion that is wanting. Or it may be that when the proportion of the column is correct the eye travels upward swiftly; but when it is thicker than it should be the eye is delayed and drawn aside, and the feeling of height lessened. If we were to widen and widen the column till it became a square all sense of height and breadth would disappear, as the object would be as broad as it is long. Garrick was often ridiculed on the score of his being such a little man, notably by Quin, the actor, who was a broad, unwieldy man. Hogarth undertook to prove by a drawing that Garrick was really tall, owing to his good proportions, and of the same height as Quin himself.

Another direction in which Adam's delicacy was shown was in mouldings and cornices, friezes, medallions, ovals, &c. In nothing is expression and feeling so much shown as in the contour of a moulding; it is akin to style in literature, or to the graces we see in "the human face divine." It would be thought, for instance, that no grace or beauty could be added to a dead wall of brick surrounding a garden, such as we see at Berkeley Square, before Lansdowne House. A rude coping of stone might be added to preserve it from the wet. Yet every time we pass it we recognise Adam's graceful touch, who has refined this homely wall. There is the feeling of proportion in the suitable height of the wall, the delicately-moulded coping and the base. The keynote to the whole is in the oval

ornament on the pier, of which he thought so highly that he had it beautifully engraved, as a thing of beauty.

Another principle was proportion in the materials. The material that he had to use for his building was what is called the common "stock bricks," ill-fashioned and ill-blended, for patent bricks did not then exist. Between this poor, homely material and the heavy stone "dressings," pillars, pediments, there was an incompatibility. The garnishing thus becomes too heavy, and the framing more substantial than the picture itself. Feeling this incongruity, he used the greatest restraint in his additions. Before his day the fashion was for huge, massive porticoes, pediments and columns, which impeded the light and overpowered the main building. Adam always made his pediment a portion of the façade, outlining it, as it were, on a surface; his columns were always "engaged"—that is, sunk in the wall, so that only half is shown. This gives a sort of homogeneous air, and makes the whole one mass. But a more important element was his use of a wonderful material—a cement—invented by one Liardot, a Swiss clergyman, which had the enduring character of stone and all the flexibility of stucco. It is impossible to say too much in praise of this material. It had none of the meanness or degrading air of stucco, but improved with years, and there are specimens now to be seen, over 130 years after, which, for sharpness and cleanliness, cannot be distinguished from stone. Out of this material he fashioned those pilasters which are an unvarying note of the Adam style. These he embroidered over with a decoration, his favourite pattern being the graceful honeysuckle sprays, a form which he brought from Dalmatia.

He must have used thousands of tons of this material in his ceilings and other forms of ornament, and they are as perfect to this day as when they were set up.

Horace Walpole always spoke sarcastically of Adam's work, though he occasionally employed him. He likened these decorated pilasters to a soldier's old coat, with its lacings down the seams; and, praising another work, he said, "It is grand, not tawdry, nor larded, nor embroidered with shred and remnants and clinkant, like the harlequinades of Adam, which never let the eye rest a moment."

Adam may, indeed, be said to have "glorified the arch" wherever he could; where others had squares or oblongs he had curves. He would bend the fronts of houses into bows; he would curve the dividing wall between a front and back room; he would arch his ceilings. The backs of his houses are agreeably diversified by assuming such forms. Thus the rear of the houses in Stratford Place is so agreeably broken as to offer something almost picturesque; and who shall say that this is not a most agreeable entertainment for the eye? The arch suggests ease and security, and also a sort of movement, as from the centre to the circumference. Things square or oblong suggest weakness and angularity.

But the most striking and original feature in his buildings was his system of fenestration, as it was called—his arrangement of the windows—by means of which he imparted a variety and beauty to his façades. In common brick dwelling-houses we find the windows treated in a negative fashion; they are simply holes in the wall, placed in rows. Adam's aim was to remove this air of monotony. He made them express what was within, and furnish as much light as possible. To this end he would group three windows together in the centre, arching the middle one, and separating them by columns. The building in which we are assembled is really a fine one, as well as a typical specimen of his system, and shows all its features.

The grouped windows in the middle signify to those outside that there is a great room behind, while the archway over it supplies the idea of strength and security which so large an opening might imperil. We should notice here the graceful, compact, business-like doorway and the dignity of the pediment and pillars, which harmonise with and do not overpower the brick. This triple window he brought with him from Spalato and used in almost every building that he erected. It might almost be considered his trade mark. It will be recognised in the Sala Regia, only he transported it from the ground to the second storey, and of a door made a window. There was a deeper meaning in his lunette, or arched window, a feature of which he was very fond, and there is scarcely a building of his without it. The lunette was a segment of a circle, not a half-circle, but about a third—a delicate distinction which an architect will appreciate—and I have no doubt it could be expressed by a mathematical formula. This device he used not only in windows, but for the fanlights of his doorways, adopting this smaller segment which, as it were, elongated the area and was more graceful.

Adam often gave a sort of finish to his houses by placing a lunette window in the upper and even lowest storey, by way of finish or apex. This, too, he also introduced from Spalato. With such devices, lunettes, grouped windows, columns, small niches and always elegant doorways, he contrived to impart an air of animation and expression to the otherwise monotonous face of a brick house.

In Trafalgar Square, where Mr. Stanford's map-shop is

now, there was a building known as "The British Coffee House," which used to be admired—a very pleasing composition, and which the architect himself was pleased with, as an elaborate engraving of it is given in his great book. This sort of design is clearly a reminiscence of Spalato, though it might not appear so at first sight; but in the ruined Golden Gate of the Palace the architect will recognise the design, for here are the lunettes and niches, and the general disposition of the whole façade.

But his last and best work, Gosford House, in Scotland, shows what picturesque animation he could produce by the arrangement of the windows. This design is full of expression and even vivacity. Each portion of the house attracts by some variety and claims attention for its expression and movement. The three great windows in the centre suggest lightness and airiness, the ornamentation is graceful and charming; even the little semicircular window next the ground has a piquancy, and, small as it is, asserts itself and catches the eye, like the little terrier in Landseer's picture of *Dignity and Impudence*.

Another note of the Adam style is the sincerity and truthfulness of the designs. Ornament or decoration is not introduced for the sake of ornament, but simply as a part of the expression. Another, the admirable workmanship, the perfect construction always found in the best specimens of old native or foreign work. The current work of our time is not remarkable for this merit, as it is associated with the general demand for cheapness. These, of course, are the marks and tokens of all good architecture, just as Mr. Guinness, the eminent porter brewer, when asked what was his secret, replied that his secret was the using only good materials. In short, we may always know an Adam house by these signs and tokens—by the triple window in the centre; by the elaborate fanlight over the door, and its elongated, lunette shape; by the breadth of the windows, the double doors, the ironwork, railings, knocker even, and the rest.

(To be continued)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. J. Macvicar Anderson, president, in the chair.

There being no preliminary business beyond confirming the minutes of the previous meeting, Professor Robert Kerr was at once invited to read his paper, entitled

Observations on the Plan of Dwelling Houses in Towns.

Professor KERR alluded first to the art of plan, incidentally saying that construction was comparatively easy. The better the designer the more difficult was his work as regarded design, while ease in planning often meant careless planning. Home comfort was the special characteristic of English houses. Climate exercised great influence on houses. What was seen in Italy would not be found in Scandinavia. Here we had the town house and the country house. In the town house height had to be substituted for breadth in the building. Crowding was a characteristic of towns, and the larger the town the greater the crowding. Unhealthy conditions resulted from crowding.

The disappearance of the towns of antiquity was no doubt due to the intolerably polluted condition of the soil. Nature, however, came to aid the town dwellers by lowering the vital standard and enabling them to live. As regarded plans of towns, each town had initiated its plan chiefly by chance, being influenced by lines of roads, business requirements, &c. Laying out towns, as it was finely termed, was only remedying glaring defects. Mr. Kerr referred to the history of Regent Street and its improvement in connection with the Prince Regent. The houses had become shabby little shops, below the mark of many a new third-rate street, marvellously made the best of, but cumbering the ground, scarcely worth their ground-rents but for the exigencies of the locality. He thought there was not such another instance in the world of so ambitious and successful an enterprise of building improvement being so prodigiously distanced by the advance of society within the limits of a single lifetime. In about twenty-five years the Regent Street leases would fall in *en masse*, and the difficulty would be to rebuild without disorganising a considerable proportion of the trade of London. What ought to be done was becoming a very grave public question. He suggested the possibility of beginning to build forthwith, and then we should have a brand new Regent Street to show long before the twenty-five years were out, not only as a great benefit to the public and the town, but equally to the advantage of the Crown estate. The first step should be the construction of a spacious subway along the centre line, which might accommodate the traffic of rebuilding. Classifying houses in a general way the town house, the suburban house, the semi-detached house, the working-man's house and, lastly, flats were referred to. Suburban houses, having escaped from town, should have as much space as circumstances would allow. Points to be considered were convenience, privacy, comfort, aspect and prospect, relations as to sunshine, light and air, &c. In

suburban houses there was no excuse for darkness or bad smells. They should not be fusty, and the hall and staircases should be as large and as bright as possible. In semi-detached houses noises should not from economy of brick-work be heard through the party wall. As to houses for the working classes, the condition of the homes of the great masses of artisans and their inferiors in large towns was not only unsatisfactory in theory, but in practice deplorably and actually below that level of domestic discomfort where degradation began to result. What working people wanted was not the dole of charity, it was proper value for reasonable rent. The term "flat" was, he believed, derived from the Scottish word that meant a floor. Medical men were, however, beginning to complain of the insalubrity of flats. In regard of foreign houses, in America the prospects were promising. After alluding to the jerry-builder, Mr. Kerr concluded by remarking that he had taken his audience over a large area, and consequently could only treat his subject somewhat superficially.

Mr. WHITE, the secretary, read a letter from Mr. Arthur Cates, who said that the suggestions made by Professor Kerr, that all tenants willing to surrender the remainder of their leases and rebuild on a general improved plan, had been put into practice on the Crown estates for the past twenty-five years. One of the most recent instances of this mode of action was the new Queen's Hall in Langham Place. There were great difficulties in the way of dealing with portions of properties before the expiry of all the leases, one being the number of subsidiary interests arising from sub-leases and settlements that had to be considered; another that areas for rebuilding could best be dealt with as independent blocks. Every scheme was carefully considered by the Crown authorities. It was a question whether the difficulties in the way of rebuilding on comprehensive scales would not be increased in the metropolis by the provisions of the London County Council's Bill now before Parliament.

Mr. LACEY W. RIDGE, in proposing a vote of thanks, referred to risks that existed in regard to some of the provisions of the Building Act Amendment Bill now being promoted by the County Council.

The vote of thanks was seconded by Mr. John Slater, who gave his experiences as surveyor to the Berners Estate, north of Oxford Street, in dealing with the numerous interests involved when rebuilding old properties on valuable sites; and the motion having been spoken to by Messrs. W. Kidner, J. J. Stevenson, Aston Webb, and the President, was carried by acclamation, and briefly acknowledged by Professor Kerr.

A collection of designs for town houses was exhibited, lent by the President, and Messrs. Norman Shaw, R.A., Waterhouse, R.A., Professor Aitchison, J. M. Brydon, T. E. Colcutt, Ernest George, Edwin T. Hall, William Young, Wimperis & Arber, William Burn, J. J. Stevenson, &c.

The reading of the paper occupied somewhat over an hour and a half, and the proceedings terminated at 10.15.

RENAISSANCE ARCHITECTURE.

IN the fifth of the lectures under the auspices of the Glasgow School of Art, by Mr. William J. Anderson, the special division treated of was "The Culmination of the Renaissance in Rome." This was distinguished from earlier periods partly by the suppression of elements of design foreign to classical taste, as well as by a greater facility in composition, richness of modelling and artistic reserve. It certainly partook more of a classical revival or reproduction than in its earlier stages, but was justified by its success if by nothing else. For there can be little question that much of what was produced in the first half of the sixteenth century in architecture as well as in painting was superior in many ways to anything that had been done before. Never were all the arts more united in a common purpose, nor had they ever abler exponents. In the period embraced between the years 1506-50 all art subsequent to that of Greece culminated. In so far as it was a resurrection of antique art it was appropriately and naturally consummated in the heart of the ancient world, for Rome at this time had recovered some shadow of its former prosperity, and had become once more in a limited sense the capital of Italy. If it did not wield its empire over Italy as in former days, it became the centre of an influence which had moulded the art and architecture of the civilised world more than any other. Brief sketches of the lives and works of the leading architects of the time were given by the lecturer, including Sangallo, Raphael, Peruzzi and Michel Angelo, and an analysis of the Roman Palazzi followed, with numerous illustrations. The history of St. Peter's Cathedral, part of which belongs to this period, was considered in detail, plans and projects of various architects being shown on the screen, together with elevations and views of the existing fabric.

YORKSHIRE ARCHÆOLOGICAL SOCIETY.

THE annual report of the council of the Yorkshire Archæological Society (which used to be known as the Yorkshire Archæological and Topographical Association) refers to the incorporation of the Society. It states that with this change in the constitution of the Society it was thought desirable to abbreviate the name by which it had been known for twenty-years by altering it to that which it now bears, and it was hoped that a long era of progress and prosperity was in store for the Society, and that all who were interested in Yorkshire antiquities would rally to its support and enrol themselves as members. The Society had had three excursions during the year, the first being held at Rievaulx Abbey and Helmsley Castle on July 26. On September 28 about a hundred members of the Society visited Kirkstall Abbey to see the works of exploration and preservation that have been carried on there for some time by two of its most distinguished members, Mr. Micklethwaite and Mr. W. H. St. John Hope, and they had the advantage of the presence of these antiquaries to explain the steps taken and the "finds." In spite of wet weather a very enjoyable and profitable afternoon was spent, and it was the decided opinion of the members present that the ruin was being carefully and well treated. To Mr. Micklethwaite and Mr. St. John Hope the Society was again indebted for their help in these excursions. On Thursday, August 10, Mr. Browne, the secretary of the North Riding section of the Society, organised a very successful meeting to Bedale, Snape, Well and Tanfield, which was well attended.

The report of the Record Series states that during the year three volumes had been issued to subscribers, namely, the second volume of the Selby Coucher Book, a volume of the York Wills Index (1554-68), and a volume of Abstracts of Royalist Composition Papers. The thanks of the council and subscribers were again due to Dr. Collins for editing the volume of Wills Index and seeing it through the press, and Mr. J. W. Clay was also to be thanked for the volume of Royalist Composition Papers, which had been transcribed at his expense, and which he had edited for the Society. Mr. W. Paley Baildon's volume of Monastic Notes was now in the printer's hands, and would form the first volume for 1894; the second volume would be either the Subsidy Rolls for the North and East Ridings, which, as mentioned in former reports, were to be edited by Mr. William Brown, or else a further instalment of the York Wills Index. The special fund which had been raised for the preparation of this index would be exhausted in the course of the current year, and it would not suffice to carry the index up to the year 1636, which was the date of commencement of Dr. Collin's Index of Untranscribed Wills in the York Registry. It seemed desirable to carry the index up to this date, but at present it was scarcely possible to form an estimate of the cost. Mr. J. A. C. Vincent had prepared abstracts of a sufficient number of Yorkshire inquisitions to form another volume similar to Volume 12, and they would be edited by Mr. William Brown, and issued as one of the volumes for 1895. Mr. Paley Baildon had kindly offered to prepare and edit a volume of Early Chancery Proceedings relating to Yorkshire. The council had gladly accepted this offer, and proposed to issue the volume in 1896.

Colonel Wilson, the chairman, in moving the adoption of the reports at the annual meeting, said he should like the Society to secure a home somewhere, where they could store objects of interest. He was sure that in time they would get together a very respectable collection, and he felt that until they had some home their operations would be more or less desultory. They had something like 600 members, but he thought they ought to have more in a large county like York. They had a sum of about 1,200*l.* invested, and the result was an income of 40*l.* 11*s.* 8*d.* yearly; but if they got a substantial increase in the number of members they could make a very satisfactory use of their subscriptions. One of the most important works undertaken by the Record Series was the indexing of the wills at York. Fortunately, owing to the exertions of Dr. Collins, that work had not only been undertaken, but so much progress had been made as to show that within a reasonable time it could be completed, but that depended upon the support that was received. Some years ago a special subscription list was opened to enable them to procure the services of a transcriber to continue the work which Dr. Collins commenced. They received 348*l.* 9*s.*, which had been expended, and if they could obtain further subscriptions they would be able to complete the work very much sooner than they otherwise could do.

Mr. G. W. Tomlinson, one of the secretaries, stated that the Council had made arrangements for a new translation of Domesday Book, so far as it affected Yorkshire, and they had issued a list of unidentified place names in the hope that local knowledge might be brought to bear upon them. They wanted to have as much help from the outside as they could.

Mr. Walker said that he was anxious during the next year to see a photograph branch of the Society established, as had been done in Warwickshire. He brought the matter before

the September meeting of the council of the Society, and after some thought and several consultations with his colleagues and members of photographic societies, he issued a circular on December 5 to sixteen societies in the county, stating the object aimed at, and asking for the co-operation of those societies with a view to securing photographs of the antiquarian and other objects of interest for the preservation and illustration of the architecture, antiquities and art of the county of York. To this circular he had received six replies. The Huddersfield Naturalist and Photographic Society and the Beverley Sketching Society were willing cordially to render any assistance. The Rotherham Society had to some extent anticipated him, for they were making a survey of their own district. The Sheffield Optical Lantern Society would send them word if they obtained any negatives during their summer excursions that were likely to be of use as an addition to their collection. The Selby and the Sheffield Photographic Societies were considering the matter, and from the remaining ten societies he had had no reply to his circular, but hoped that when their committees met they would take the suggestion into consideration. On December 19 he had a letter from Sir Benjamin Stone, who had been the leader in the very successful Warwick experiment, and he would be glad to give them the benefit of his advice and experience in starting their survey. The council would be glad of any suggestions from members or others interested in the scheme.

NEW ZEALAND TIMBERS.

AT the meeting of the Northern Architectural Association, Newcastle-on-Tyne, in the absence of the president (Mr. J. H. Morton), Mr. J. Oswald occupied the chair.

Mr. C. E. Oliver, F.S.I., read a paper on "New Zealand Timbers," of which the following is an abstract:—

Notwithstanding that, to the architect, the study of timber and timber trees is of the greatest importance and vastly interesting, it is, I believe, the most neglected subject in that long and ever-increasing list of things he is expected to have a knowledge of. A knowledge of timber and the timber trade is absolutely essential to the architect who would write a practical, straightforward specification. Timber is unlike any other of the materials of construction with which we have to deal, in so far as (1) it is not only the most perishable, but the most liable to serious defects of all the materials we use; (2) we have no substitute for it in most of its uses; (3) we are absolutely dependent upon importation for our supply. In the study of timber, archaeology, architecture, geography and botany are all curiously interwoven; nor let this last-named subject alarm you, as but little botanical knowledge will suffice for your purpose, but geography is very important. If you commence by forming a small "wood museum" for yourselves, and diligently reading up such works as William Stevenson's "Trees of Commerce" and Laslett's "Timber and Timber Trees," you will soon acquire a fund of practical information which will be a pleasure to yourselves and a benefit to your employer. I would also commend to your notice for careful perusal such papers as that read by Mr. Barnes in December last at the London Architectural Association, and also remind you that much information will be found in the *Timber Trades Journal*. There are an immense number of works bearing more or less upon the subject. Professor Sargeant's great work, "Timber Trees of North America," is most comprehensive, and contains without doubt the best account of American timber trees ever published. The architect of the present day must needs add largely to the old list of woods of which he should have an intimate knowledge. The fact that the best class of Baltic goods are becoming increasingly difficult to obtain, and the Canadian pine rising to such a high price, together with the extremely low steamer freights now obtainable, is bringing many other kinds of wood within our reach which but a few years ago were scarcely known in England outside of Kew Gardens. The British timber market lays under contribution every country in the world. The value of timber annually imported into this kingdom is about 16,000,000*l.*, and in London or Liverpool may be found the best stocks of timber ever gathered together in any city. From Europe we import some twelve or thirteen different timbers, from Asia about fifteen kinds, Africa twelve or thirteen kinds, North and South America something like fifty kinds, and from Australia and New Zealand six or seven kinds. While as yet there are no signs of that "wood famine" predicted by some, I think that we shall certainly be driven further afield for our supplies when quality is of more consequence than quantity. The United States have practically ceased the exportation of yellow pine, and now import immense quantities from Canada. The Baltic provinces appear to be simply inexhaustible in point of quantity (but how long they can maintain a supply of the better class of deals is doubtful); however, the huge timber industry of Russia, Finland and Sweden will for long insure us in England of having a supply of cheap timber. It is considered by

good authorities in the trade that many years will not elapse before lumber will be dearer in America than it will be in Europe, owing to the large yearly increase in the consumption in the United States and Canada itself. The forests of New Zealand, although comparatively small when contrasted with the huge belts of timber-land in North America, contain such a large variety of valuable timber trees that they must prove of enormous value in the near future. These forests are said to cover an area of over 20 million acres, about half of which are Crown lands and the greater part of the remainder is in the hands of the European population. New Zealand is so well watered and so well adapted to the growth of timber, that even when forests are cut down they soon reproduce themselves, but this is no excuse for the wanton waste which often takes place after trees have been felled for timber purposes. The forests are known to contain upwards of forty distinct varieties of timber trees, more than twenty of which are suitable for architectural work, cabinet making and many other purposes. Active steps to promote a large export trade are being taken by the Midland Railway Company of New Zealand and the Kauri Pine Company, Limited, who both possess most valuable concessions of excellent timber lands. For some years past kauri has been imported into this country, and shipbuilders, who are ever pioneers in the use of wood, have readily acknowledged its splendid qualities. Now it appears to me that if kauri (the most costly of the New Zealand timbers) can be imported here at a price enabling us to use it freely, I think the same might be done with many other woods, such as the red pine, black pine, totara, &c. This no doubt you will consider a matter for the timber trade to settle, but I think otherwise. Timber merchants naturally only supply what there is a demand for, but if architects had a better knowledge of the timbers of various lands, and inquired for them, no doubt we would soon have a large choice. Of course shippers will not send woods which are unknown to our profession, and which may have to lie in stock years before going off. The Colonial Exhibition, and now the Imperial Institute in London, will, I believe, do a great deal to help this forward, and the day may yet come when our middle-class houses will be fitted with natural woods and the paint-pot almost banished; this would be another step towards the "house beautiful." The indigenous forest of New Zealand is evergreen, and the general character of the woods resembles the growth of Tasmania and the Australian continent; most of the woods are harder, heavier, and more difficult to work than the European and North American timbers. They vary, however, very much among themselves, and are mostly very durable. The majority of the trees rise to a height of 40 or 50 feet before putting out their branches, a detail which insures the production of a large amount of clean, regular-grained wood of great size, an article which is becoming more and more difficult to obtain in Europe and America.

ROYAL CAMBRIAN ACADEMY OF ART.

THE annual meeting of members and associates of the Cambrian Academy was held on Saturday at Plas Mawr, Conway, and was largely attended. Mr. H. Clarence Whaite, who presided, was unanimously re-elected president, an honour he has held since the initiation of the Academy. In acknowledging his re-election, the President remarked that the position of the Academy financially and in point of membership and the growing excellence of its exhibits was most satisfactory. Mr. Cuthbert C. Grundy was re-elected vice-president, Mr. G. Swinford Wood and Mr. J. Pain Davies being appointed to the respective offices of honorary treasurer and secretary. The following artists were elected on the council:—Messrs. George Cockram, J. H. Cole, B. Fisher, B. Fowler, P. Ghent, Anderson Hague, R. G. Harrison, Leonard Hughes, J. Johnson, J. Clinton Jones, Joseph Knight, A. F. Perrin, Charles Potter, J. C. Salmon and W. Slater. Mr. John Finnie was unanimously elected a full member and Messrs. S. Sidley, Arthur Baker and G. Sheridan Knowles were elected full members from the list of associates. Messrs. Harold Hughes, Paul Knight, G. Hall Neale, Oliver Baker and Reginald Smith were elected associates of the Academy out of a long list of candidates. The receiving days for the exhibition of 1894 were fixed for April 27 and 28; press day, May 9; private view, May 12; the Academy being opened to the public on May 14. Messrs. B. Fisher, B. Fowler, P. Ghent and Anderson Hague were appointed the hanging committee, and Messrs. W. J. Slater and B. Fowler were elected honorary auditors. Messrs. Arthur Baker and Harold Hughes have the care of Plas Mawr, Conway, the home of the Royal Cambrian Academy, where the annual exhibitions are held.

M. Paul Delair, conservator of the Musée of Comparative Sculpture at the Trocadéro, Paris, died recently in his fifty-second year. In 1870 he published a volume of poetry, and several of his plays have been performed in Paris. He was for several years attached to the Department of Fine Arts.

NOTES AND COMMENTS.

A NEW chapter in the history of international relations appears to be opened by a proposal which has emanated from the Congress on the History of Art that was lately held in Nuremberg. The humblest student of that history does not go far before he has to suffer from incomplete information, and professors and specialists will tell him that after a life of inquiry they also are not acquainted with all the materials that are useful. It must be remembered that the investigation of the history of art generally takes the form of devotion to the works of a particular artist, whose reputation may be local rather than of universal interest. Sometimes discoveries are made which, being printed in the proceedings of societies, may be considered as buried. Italy furnishes innumerable examples of that sort of entombment for subjects that relate to the arts. What was advocated at the Nuremberg Congress was the founding of institutes which should contain materials for the history of art, such as books, essays, documents, drawings, &c., and especially registers and indexes from whence the student could learn what information was available and where it was to be found. Something of the kind was commenced at South Kensington when HENRY COLE began the publication of a catalogue of books and essays on art, but it is as well to be silent about the attempts that were made to realise his idea. The selection of the most fitting place for establishing the first Institute was soon determined. It was agreed that Florence was entitled to the distinction from its association with the history of art. To carry out the arrangements fifteen members were appointed as a committee, with Professors MAX ZIMMERMAN and SCHMARSON and Herr BAYERSDORFER as secretaries. Subscriptions will be received at the banking-house of MENDELSSOHN & Co., in Berlin (which was founded by the philosopher who wrote so eloquently about art), while books, drawings and other materials can be sent to E. A. SEEMANN, in Leipzig. The proposal may now appear premature, but sooner or later it will be realised.

A COPY of the will of the late Dr. AUBREY BOWEN, of Melbourne, has been sent to the trustees of Mason College, Birmingham. In it the testator directs that his trustees are to pay out of the income derived from his property to the trustees or other proper officers of the Mason Science College at Birmingham, in England, "the annual sum of 600*l.*, free and clear of all deductions, upon the condition, however, that the said trustees or other governing body of the said college for the time being shall, within a reasonable time, undertake to apply the same to the founding of six scholarships of 100*l.* per annum, each in connection with the said college, to be called respectively the first, second and third Bowen Scholarships, for the promotion of the study of metallurgy and civil, mechanical and electrical engineering, and the first, second and third Priestley scholarships, for the promotion of the study of chemistry; and I direct that the trustees or other governing body of the said college shall have discretionary powers to establish the regulations or conditions of the said scholarships and the qualifications of persons desiring to become candidates." The bequest is of the greatest advantage to the college, which is less wealthy than is commonly imagined. It will also serve as a sort of compensation for the outrage which the people of Birmingham committed on JOSEPH PRIESTLEY, when they set fire to his house, and destroyed his valuable chemical apparatus and manuscripts because he dared to approve of the French Revolution.

THE directors of the Grafton Gallery were fortunate in obtaining the loan of about a hundred paintings, drawings and sketches by the late ALBERT MOORE for their exhibition. They become more remarkable owing to the character of the foreign works in adjoining rooms. ALBERT MOORE, like his brother with sea-pieces, was able to gain success without much exercise of ingenuity in devising novel subjects. Two or three figures of young people half-clad were all he required, and with a little variation of posture, drapery or colour they served him for many years. But that variation was more satisfactory to the initiated than would be the most startling novelties. It is natural that a

collection of ALBERT MOORE's works should appear to be monotonous. It must be remembered that they were not produced under the supposition of forming a combination, for the painter did not anticipate that more than a single example by him would be seen in a room. The charge of monotony may, with as much reason, be applied to many a collection of Greek sculpture. ALBERT MOORE's works would sustain the companionship of that sculpture. He does not copy the faces, figures or drapery of the Greeks, but there is no doubt he endeavoured to realise the old forms in a nineteenth-century manner. His figures are English youths and maidens, although not clad in the garb of England. The works are by themselves sufficient to reward a visit to the Grafton Gallery. The foreign pictures are varied, and present some of the latest manifestations of the art of painting in France, Belgium, Holland and Germany. There are also several characteristic examples of the modern Glasgow school.

ONCE again the ruins of the Palais d'Orsay, where the Cour des Comptes was seated in Paris, are on the *tapis*. More than once the blackened walls, and the weedy spaces between them, have been formally made over to the Union des Arts Décoratifs, for the purpose of establishing a sort of South Kensington Museum, but the Union could never gain sufficient courage to start the works. It was also proposed to restore the building and use the rooms again for a Cour des Comptes, but the cost scared the French Government. The estimate by M. MOYAUX amounted to about 400,000*l.* Another scheme for restoration was prepared by M. PAUL DUBOIS, which it appears could be realised for less than half that amount. It has gained the approval of the officials as well as of several leading statesmen, and efforts are being made to obtain a grant of the money that is necessary for the works. M. DUBOIS has no desire to supplant M. MOYAUX. The latter has jurisdiction over the ruins, and M. DUBOIS considers he is entitled to have charge of any restoration of them which may be undertaken. There is no doubt the Palais is a blot which disfigures one of the Quais, and moreover it is a visible memorial of political madness. It is incomprehensible how the patience of the Parisians could have tolerated the ruins for over twenty years.

AT the present time people in Paris are confident that the new scene-lofts for the Opera House will be erected on the fortifications. All the official difficulties have been overcome. There is a large bastion known as No. 45 near the Porte d'Asnières, which appears to be well adapted to become the site of the buildings. As it has an area of about three and a half acres, there is sufficient space to accommodate the scene-painters of the Opéra Comique and the Odéon as well as of the Opera. The bastion is also accessible. The Boulevard Berthier bounds it, and scenery can be conveyed from it to the Opera House in about half an hour. There is direct tramway communication. Another advantage is that the ground is to be obtained without cost, and the sum which will be derived from the site of the buildings in the Rue Richer will go far towards the cost of the erection of the scene-lofts. It may seem odd to set up buildings of the sort on a fortification, but in case of war they could be used for barracks, hospitals, or stores. The advantage of M. THIERS's costly line of defence is, moreover, not generally admitted, and many competent judges consider the whole of the ground covered by the fortifications might be converted into building sites without increasing the danger of the capital.

HERR BEGAS, the sculptor who has obtained the commission for the monument of the Kaiser WILHELM I., which is to be erected in Berlin, has submitted his model to the Emperor. The reconciliation with Prince BISMARCK has affected the design. Instead of mythological and symbolic figures, the bas-reliefs will represent scenes in which the Prince and Field-Marshal MOLTKE will be introduced. The model in its altered state will be submitted to the Reichstag, but there is no likelihood that any objection will be raised to the arrangement which was inspired by the Emperor.

PETTON HALL, NEAR BASCHURCH, SHROPSHIRE.

THIS house, stables and two lodges have been built in Petton Park for Captain ELLIS BROOKE CUNLIFFE. All fittings in the main parts are of Dantzic oak, dull polished. The electric lighting is by Messrs. W. LEA & SONS, of Shrewsbury, and is a very satisfactory work. Mr. THOMAS BOWER, of Nantwich, is the architect, and Mr. RICHARD BECKETT, of Hartford, the builder.

GLASGOW CATHEDRAL.

THE illustrations have been taken from drawings by Mr. LOCHHEAD, prepared in connection with the Summer Sketching and Measuring Class, held at the cathedral, as part of the training given to the students of the architectural classes at the Glasgow and West of Scotland Technical College (which will be resumed in April and will meet till October), under the superintendence of Mr. CHARLES GOURLAY, architect. The bay represented is one of the finest; the capital of respond on north side is earlier than that on the pier to the south, but the arch detail is of the earlier character. The triforium details are also early, while the clerestory appears to be of later date.

The following notes on the cathedral, prepared by Archbishop EYRE, are worth appending:—

SCOTTISH ARCHITECTURE.—Norman Romanesque, A.D. 1066-1154. First Pointed (Early English), Transitional, 1154-89; Developed, 1189-1286. Second Pointed (Decorated), English Character, 1286-1371; Scotch, 1371-1560.

XII. Century.—A small fragment at the south-west corner of the lower church, c. 1180, is all that remains of Bishop JOCELIN'S work.

XIII. Century.—The lower church and the choir above it were built by Bishop BONDINGTON, c. 1245. The choir was finished before 1280. The transept was built about the same time. The nave was finished about the end of the century. The central tower, below the belfry windows, was built before 1300.

XIV. Century.—The work of nave, aisles and transepts continued. Tomb of Bishop WISHART, at east end of lower church, was erected c. 1317.

XV. Century.—The north-west tower was built after the completion of the nave. The stone tower was begun by Bishop LAUDER (1408-25), and the spire was finished by Bishop CAMERON (1425-47). The chapter-house, the sacristy above it and the rood-loft were built between 1425-35.

XVI. Century.—The stairs leading to the lower church, the undercroft of the proposed south transept, and the altars in front of the rood-loft, were built by Archbishop BLACKADER (1484-1508).

The north-west tower, the original bell tower and the south-west tower, or consistory house and library, built c. 1350, were taken down in 1846.

It should be known that "crypt" and "lady chapel" are wrong names to give to the lower church and the east aisle.

MEASUREMENTS, &c.—*Cathedral.*—Total length, 319 feet; total width, 63 feet; length of nave, 151 feet; width, 30 feet; height, 85 feet; length of choir, 103 feet; height, 93 feet; east aisle and chapels, 63 by 28 feet; sacristy, 28 by 28 feet; height of spire, 225 feet.

Lower Church.—Total length, 125 feet; total width, 62 feet; height, under aisle, 20 feet; height, under choir, 15 feet; chapter-house, 28 by 28 feet; BLACKADER'S undercroft, 59 by 35 feet.

In Both Churches.—Number of windows, 157; number of pillars, 147.

The Triennial Exhibition of Pictures by the Stirling Fine Art Exhibition has just been opened in the Smith Institute. Four hundred and twenty-four oil-pictures have been hung in the large hall, and 270 water-colours, drawings and engravings in the small gallery, and there are also thirteen pieces of sculpture on exhibition, the works catalogued numbering in all 707.

THE ADVANCEMENT OF ARCHITECTURE.*

By GEORGE AITCHISON, A.R.A.

I BEGAN to prepare a course of lectures on Romanesque—the diagrams on the wall will show you how far they had progressed—but though I still think that the study of Romanesque is valuable in showing us how the savages who overran the Roman Empire progressed in architecture, I became convinced that a continuation of last year's lectures might be more useful. I said something about the value of architecture to mankind in my last course of lectures, but I shall go over the ground again, for unless students are convinced of the importance of their profession to mankind, they will hardly be impelled to give that time, energy and devotion to its study that its merits demand. I use the word devotion to express the frame of mind that each student should bring to the study of architecture, in the hopes of advancing it for the benefit of mankind; a devotion that must not look to profit, honour or fame in its pursuit, and only for that meed of pleasure which is spoken of by the poet—

There is pleasure in poetic pains that poets only know.

Actuated by this devotion, which is at once benevolent and patriotic, he will emulate those philosophers who devote their lifetime to the examination and recording of some phase in nature which it is probable some one else will use.

The architect is even less fortunate than the poet, for it is a rare case when the poet cannot get his poem published. It is, however, common enough for the accomplished architect never to have anything to build which can show his skill; for should he be greatly in advance of his age, it is almost certain that any drawing or model he presents for approval will not be accepted.

The higher energies of mankind are now mainly devoted to the elucidation of the problems of nature, and particularly to that grand problem of the ultimate atoms of which the universe is composed. These speculations were almost entirely abandoned during the early days of Christianity; necessarily in the dark ages and during the enforced ignorance of Mediæval days.

Since the revival of learning, philosophy has again started from the speculations of the Greek philosophers, whose last exponent was Lucretius, about 55 B.C. The modern philosopher, however, has all the new sciences, chemistry, light, heat and electricity to help him, as well as apparatus that more or less enables him to verify his hypotheses.

As "ignorance is the curse of God, knowledge the wing wherewith we fly to heaven," we should be grateful to the philosophers who pursue their profound studies with no hope of reward but the knowledge they gain, and who have shown us that nature proceeds by unflinching and unswerving laws, and that all we can know is from the investigation of our universe. Such studies, however, should not so completely absorb the best energies of all the greatest of mankind as to entirely turn away their thoughts from other things which should ennoble and delight mankind.

Some consideration of our universe is good for all, as a set-off to man's overweening pride. It is good to be occasionally reminded that to our universe man resembles the animalculæ in a drop of dirty water; still, it is not good for man to wholly dwell on his own insignificance, as it is too apt to make him regard his actions as of no importance.

That an ant should appropriate to his own use a grain of corn which it ought to take to the common store does not seem of much importance to us, nor to the world, though it is of vital importance in an ant-hill, and our ant-hill is this earth.

As regards man, it must still be affirmed that "The proper study of mankind is man." Anything we can do to discipline, raise and delight him with ennobling pleasures, is of more importance than to know the conformation of the circumambient ether. I consider that the triumphs of architecture do afford such ennobling pleasures to mankind, and I wish I could say with Sir Henry Wotton, that "Architecture can want no commendation where there are noble men or noble minds."

No one can expect to thoroughly appreciate even the outside shapes of fine buildings without having some cultivation, or some natural susceptibility to beauty. Although it may appear scarcely credible, yet it is true that there are people who are unaffected by the beauty of inanimate nature, and we can scarcely expect such persons to be affected by architecture, though this may not always be the case, as man, cultivated or not, is mostly more affected by the highest and most enduring efforts of man than by the works of nature, for the one implies genius, knowledge, skill, power and wealth, and the other seems but the spontaneous action of necessity. Those who do observe and admire the beauty of shape in rocks and mountains, in the sea and its shores, in trees, plants, herbs and flowers, would naturally admire the fine shapes of buildings. I

* A lecture delivered at the Royal Academy on Monday, January 29, 1894.

should not like to affirm that fine buildings, even the most beautiful, exceed in beauty the finest things in nature, though I think they do; but they certainly bring home to us their relationship to man in the most charming and delightful way, and in a way that natural objects do not, however striking or beautiful they may be. When you see fine buildings in the midst of nature, it is like hearing your native tongue spoken in a foreign land. In walking on the other side of the Thames, by Cookham, you see a succession of all the beautiful and varied forms of the upper woods of Cliveden, and amidst them the outline of a pretty little pavilion, which goes to your heart at once, for it is man's work. In some respects, too, man's larger works exceed those of nature. Even in size, for as Mr. Ruskin has pointed out, there is no sheer plane in nature that equals the front of a large building. In that pinnacled plain near Amalfi, that at a distance is taken for a Mediæval town, the biggest rocks seem much smaller than Gothic cathedrals.

I believe the same is true of towers; there is no square isolated mass of rock that equals the bell towers of Italy, for though at Orkney the "Old Man of Hoy" is said to be 600 feet high, it is but a ruin. The effect of that mountain at Utah that is called the "Western Temple of the Virgin Valley," is said to surpass all description; and of course nature can deal with heights and masses that dwarf to insignificance the puny efforts of man. Yet nature's chisels—heat, frost, wind, rain and lightning—do not carve the mountains into shapes as dear to us as those forms which the genius of man has erected for our admiration. Blind force acting for ages beyond count on dead matter can never excite the same admiration as that due to high intelligence working for man's delight. Hints, however, for all sorts of forms and all sorts of arrangements are culled by genius from nature's works, but experience alone can show that these hints when worked up produce the desired effect.

We can never separate the visual effects from the mental rebound that tells us whether these things have been done by man to raise emotions, or are but the outcome of blind necessity. Still, we can only learn from nature's and from man's works, and as nature's are the grandest, we get from them the rough-hewn sources of emotion, while from buildings we learn the devices for producing such emotions in less gigantic works. Height, vastness and gloom, and the sudden change from dark to light affect us all, whether they be produced by nature's hand or by man's. Yet the thought of the power and originality of so small and feeble a creature as man does much to enhance the value of his colossal works. Various and striking are the effects and innumerable are the beauties that can be seen in nature, and that can by the efforts of genius be used in man's work. Most persons when they look from a sunlit glade into a forest are delighted by the view of the numberless and vast branchless boles gradually lost in grey obscurity; there is always a thrilling feeling of sublimity in looking from the light into the impenetrable darkness of some cavern's mouth, and both these motives have been seized on and utilised, the former in the porticoes of Greek temples, and the latter in some of the vast porches of Gothic cathedrals, Coutances, perhaps, affording the finest example.

In architecture there is a recurrence, a symmetry, a rhythm, an ordered alternation of light and shade, of flatness and projection, and a delicate proportioning, that produces in us a calm feeling of delight; there are, too, the repeated alternations of contiguous light and shade that excite the eye, contrasted with smooth surfaces that give it rest, and in the occurrence of varied and contrasted forms that make the æsthetic part of architecture particularly taking; but it is a vague and indefinite delight, like music without words. As far as I can recollect very few writers have noticed this special æsthetic charm. Madame de Staël is one of the few writers who has felt this charm. There is a passage in her "Corinne" that well expresses it, and that is almost unique in literature. When Corinne is standing by one of the fountains of the Piazza, and looking at St. Peter's, she says:—

"Painting and sculpture mostly imitate the human form, or, at least, some object in nature, and therefore awaken in our soul perfectly clear and positive ideas; but a beautiful monument of architecture has not, so to say, any determinate sense; in contemplating it one is overcome by that reverie without calculation and without aim which leads the thoughts so far. The sound of falling waters induces the same vague and profound impression; it is as uniform as the building is regular. 'Eternal movement and eternal rest' are thus brought together. In this place, above all, time is without power, for it no more stills these gushing waters than it moves those motionless stones."

Architecture, however, tells other tales besides producing vague emotions of delight; it tells of a nation's desire to perpetuate by monuments its feelings of adoration, its admiration for the glory it has achieved, or the grandeur it has attained. These desires have in past time evoked the genius of the architect and have enlisted the labour of the thousands of toilers

to embody his conception in hard and ponderous materials. Every vast monument expresses the desire of a nation to devote some of its earnings to the embodiment of an ideal, or at least its contentment that this should be done; for no tyrant exists, or ever has existed, except by the acquiescence of the bulk of those he rules. The heavy tax laid by Justinian on Constantinople to build Sta Sophia at least shows his people's acquiescence, or he would have been hurled from the throne. A philosopher says all the reward and immortality of the unknown labourers at the Great Pyramid are enshrined in its stones.

Architectural monuments not only keep alive the memory of dumb nations—for without them what would now be known of the greatness of Egypt, Assyria, and Persia?—but their monuments afford a measure of their wealth, power and greatness, and give us the most concise compendium of the cultivation they had reached. It is therefore of the utmost importance that architectural monuments, besides their impressiveness and grandeur, should express the taste, feeling and skill of the nation at the time of their building, and not be copies or paraphrases of former buildings. We should be as proud of what we can do as Touchstone was of his bride:—"An ill-favoured thing, sir, but mine own, for rich honesty dwells like a miser, sir, in a poor-house; as your pearl in your foul oyster."

However admirable the architecture of former times, of other people, or of foreign climes may have been, I trust that neither the architect nor the people want to be like the "jackdaw with the peacock's feathers"; but, besides this, if the architecture we paraphrase was of other climes, it cannot be proper for this climate; if it was that of other nations it cannot exactly represent what ours should be; and if it were of former times it would still not represent what we now feel or most admire.

A passion for the newly-advanced geometry was one of the characteristics of the Saracens and Mediævals, but now nothing can be more nauseating in the imitation Gothic of the day than the geometrical figures with which it is overlaid, for these only remind us of a child's efforts with a pair of compasses. If there is no desire for beauty in the people, and no original skill in the architects, it is at least honest to have a dead wall with holes in it than the most brilliant fancy dress in imitation of other tastes and other times.

Some day, when investigators have found out the diagnosis of architecture and sculpture, the capacities of a nation will be as clear to them from its architectural remains as the shape of an extinct creature is to an anatomist from the fragments of its bones. Most of us have wondered what the minds of the barbarians were like who carved on their churches those ornaments that look like the flock of geese Baron Munchausen captured with his line and eel.

The obtrusiveness of architecture is another of its characteristics, and not the least important one; buildings are not like books, statues, pictures or musical instruments, that can be hidden away. In towns they meet us at every step, and compel some attention, even if it be but momentary. However small buildings may be they take from us some light, some air, and the prospect; so they are not merely to be looked on as useful things for the occupier, but as things that owe everyone a debt for what they have deprived him of, and must be made slightly if not comely. There are, however, exceptions to this rule, in the case of erections built by society to awe or terrify us—like police stations, law courts, prisons and the gallows. Those buildings which dominate towns and have been built for some noble or grand purpose should declare their use. It is needless to point out their obtrusiveness, when astronomers tell us that if our side of the moon be inhabited, it is not by a race of great builders, for the telescope would reveal anything built there that was as high and as big as St. Paul's.

The building of a vast structure, even of an immense feature involving a forest of scaffolding, huge heaps of material, and thousands of workmen, naturally impresses the people; so we read in books of the time, of the domes of Sta Sophia, Sta Maria del Fiore, St. Peter's and St. Paul's being called "mountains." We must consider, too, the effect that vast and magnificent buildings have on foreigners, and the notions they get from them of the greatness and civilisation of the country, not to speak of the wealth magnificent buildings bring by the influx of visitors. Vast and magnificent buildings possess another power, which is not, however, pleasant to contemplate—the sort of limited immortality they confer on great nations that have perished. Even the ruins of such buildings speak of its former wealth, greatness and cultivation, and engender visions and regrets, as well as affording permanent records of the place where the great nation had its home. Books, pictures, statues and other movable works of art become either the property of the world or of the nation that possesses them. It requires an effort of the mind to refer them back to their native country, but the ruins of fine monuments fix the locality, and cannot be dissociated from the place.

The mind, too, seems more ready to transfer the isolated works we have seen elsewhere to the buildings we are contemplating. The ruins, too, of fine architectural works form a school for the barbarians who have settled there, and may eventually be the foundation for a new style.

Every building is so intimately connected with man that it must be noticed by the poet, the writer and the painter; for except in the cases of battles, some building mostly forms the background to the most striking actions of man's life. Besides, the importance, the grandeur, the beauty or sublimity of monuments has always made them favourite subjects for introduction by the painter and the poet. It would be difficult to find a poet not purely pastoral or didactic in whose works admiration for fine buildings is not expressed, from Homer's description of the metallic palace of Alcinoüs to the Palace of Art of the late Poet Laureate; though he unfortunately lived in the days of the Gothic revival.

The great poet of the Middle Ages, Dante, was born in 1265, just after St. Louis was defeated and taken prisoner in the Seventh Crusade.

Considering that Gothic was invented less than a century before Dante's birth, one cannot help thinking that, had he been much in France, he must have been forcibly struck by the wonderful buildings in the new style, and have written about them, even though his model, Virgil, took little notice of architecture. The great progress then made in Italy was, however, in sculpture and painting, and these were evidently the arts he most admired, for he composed in words charming groups of sculpture for the walls and pavement of the ascent to purgatory. He was, however, such a keen observer, that he makes a simile of the burdened souls in purgatory from a corbel.

As to support incumbent floor or roof,
For corbel, is a figure sometimes seen,
That crumples up its knees unto its breast;
With the feign'd posture, stirring ruth unfeigned
In the beholder's fancy; so I saw
These fashioned when I noted well their guise.
("Purg.," can. 10, l. 130-135. Carey's translation.)

Chaucer, however, our fellow townsman,* who was born in 1328, seven years after Dante died, and who lived till 1400, was both an observer and an admirer of architecture, and describes buildings in many places rather minutely; and though his English is occasionally difficult to understand, and his verse quaint and rugged, there is a charm about it. So I give you his description of the "House of Fame":—

All was of stone of berile,
Both the castell and the toure,
And eke the hall, and every boure,
Withouten peeces or joynings,
But many subtell compassings
As babewinnes and pinnacles,
Imageries and tabernacles
I saw, and full eke of windowes,
As flakes fallen in great snowes;
And eke in each of the pinnacles
Weren sundry habitacles.
(Chaucer, "House of Fame," lib. 3, v. 93)

I may say that "babewinnes" are baboons. The writers of the Middle Ages irreverently called grotesque Gothic sculpture and painting "baboon work."

The architectural descriptions in the poets, even including Wordsworth's Vision, mostly contain only a few vague terms; costliness of material mostly doing duty for beauty of design, which, after all, cannot be properly dealt with in words. Milton's language is, however, so sublime that we can well bear his description of Satan's golden Renaissance palace:—

Anon, out of the earth a fabric huge
Rose like an exhalation, with the sound
Of dulcet symphonies and voices sweet,
Built like a temple, where pilasters round
Were set, and Doric pillars overlaid
With golden architrave; nor did there want
Cornice or frieze, with bossy sculptures grav'd;
The roof was fretted gold.

("Par. Lost," lib. i. v. 710.)

If all the architecture were to be erased from sculpture and painting and blotted out of literature, what gaps would be left in pictures, bas-reliefs and books. Think how bald even the "Arabian Nights" would become without the architectural surrounding of the stories. So I think we may consider that architecture fills a good space among the achievements of mankind. Is it not well worth the devotion and striving of the architects, the aspirations and efforts of the students, to put it once again into the way of improvement and progress?

Although architecture now brings no honour, glory or fame, mankind may again turn to admiring it, as at former epochs. Future architects may become as famous as Ictinus, Callicrates and Mnesicles, as Anthemius of Tralles and Isidore of Miletus,

* He is said to have been a Londoner.

as Giotto, Brunellesco or Bramante, as St. Gallo, Palladio or Wren. We must, however, admit that Milton was right when he called fame "that last infirmity of noble mind," for truly the world has received as much instruction and delight from the work of nameless Roman, Gothic, Saracen and Renaissance architects as from those who stand in the temple of fame. Building we could scarce do without, to protect us from the weather and from robbery, to stow our goods in, or to work up our materials, unless we fell back into primitive savagery.

If we pretend to any culture, we want our commonplace buildings to have character and comeliness, and those for noble purposes to raise strong and adequate emotions, for if all buildings were wholly and purely utilitarian, it would be like exchanging oratorios of the great composers for the din made by the rivetting of iron ships.

All the fine arts are necessarily progressive, but their strongest appeal to us is when they portray the emotions of the day. Sir Walter Scott pointed this out in his "Waverley Novels;" he said that he had made all the accessories as true to the time as he could, but not the personages, for had they represented the real persons no one would have cared to read the novels. To make his personages interesting they spoke, acted and thought like those of his day, and this is true of every fine art. There was a simplicity, a directness, an intensity and a dignity about all the historic personages of Greek times that has made antique poetry, eloquence, sculpture and architecture unsurpassed and possibly unsurpassable. The artists—and under this name I include the poets—of to-day have to deal with people who are feebler and less dignified, but more varied and complex than the ancients; but now, as then, existing personages must be the actors, and must be made like life, or their works must appeal to present emotions, or they do not interest us. As long as noble qualities, character and beauty exist in nations I believe there will always be artists to express them. The art of expression is mainly learnt from the past, but the artists must be animated by the spirit of the present. The cause of Tennyson's works being so highly valued and so widely spread amongst the English-speaking race, is, apart from their harmony and beautiful diction, due to their being imbued with the knowledge, thoughts, feelings and aspirations of his day. There have been times of brutal barbarism, there have been times of vileness, corruption and cowardice that could give rise to no poetry. Architecture only deals indirectly with man; it has to meet some of his necessities, habits and artificial wants, and æsthetically to move those emotions that are proper to the uses of the building.

If any fine art had ever arrived at a perfection that would be appropriate for all purposes and for all time, that art would be done with—there could be nothing more to express, and we could but apply the stereotyped form to what we want. This perfection has by no means been reached in architecture; it is difficult to see how it ever could be reached while man's wants and knowledge progress and his tastes change, though unhappily we too often act as if this were the case. We have many new necessities, thousands of new wants, and many new materials that must have new proportions and somewhat new forms, and certainly new methods of construction. We have new beliefs, new knowledge, and I think I may safely say new hopes and new aspirations, though these hopes and aspirations may be vague. It can hardly be said that we have availed ourselves of all these changes from the past, though we may be slowly working to bring about a very different order of things in architecture. Those who are familiar with the ways of nature know that the gradual subsidence, or the gradual elevation of parts of the earth's crust are usually too small to be observed until the lapse of centuries. All we can say about architecture is that it has received in our time no sudden and immense development; it has not been affected by one of those tremendous volcanic eruptions that has suddenly changed a level surface into a mountain, like that which, in Renaissance days, filled up the Lucrine lake.

In the very early Renaissance days there were apparently but few architects in Italy, and the scholars, antiquaries, goldsmiths, painters and sculptors thought they had found perfection in ancient Roman architecture, and in the precepts of Vitruvius; in consequence, architecture then ceased to be a progressive structural art. We have not altogether shaken off this Renaissance fallacy, although we have several times changed the model; Greek, Gothic and the Dutch Renaissance have successively been held to be the acme of perfection.

My object is to consider if architecture can get into a progressive state again, and, if possible, how it may be done. I could fill the whole of my lectures with the facetious diatribes of non-professional writers against modern architecture and architects, if I thought any benefit would be gained by so doing. All architectural archaeologists know the slow evolution of the different architectures, now called "styles"—an evolution that it has mostly taken many centuries to effect. Yet these critics write as if they thought it was mere sloth or perverseness that prevented clever men from inventing new

styles in an hour, a day, a week or a month. So the main use of such quotations would be to show the critics' ignorance; and even if it showed a real and earnest desire in the country for something new, it would only illustrate the theory of political economy—that it is the supply that creates the demand, and not the reverse.

We must, however, admit with due regret that as yet there is no architecture in Christendom that in our eyes can be called good, true and distinctive of the present century. All those engaged in rapidly progressive fine arts have treated with contempt the work they have surpassed, as men of science do exploded theories. The Greeks at their apogee used their old statues as rubbish to fill up holes; the Mediaevals used carved Norman stonework as raw material and carved on its back, and the Saracens did the same with some of their carved woodwork; while such is our humility that a large portion of the profession is engaged in restoring old buildings or in building imitations of the past. The same may be said of some of the sculptors and painters in regard to Gothic statues and stained-glass.

If we wanted any confirmation of this we have only to look at a modern architectural guide-book to an English town; we shall there find the different buildings described as Greek, Roman, Byzantine, Romanesque, Saracenic or Moorish, Norman, Early English, Geometrical, Perpendicular, Tudor, Elizabethan, or Renaissance. To get a popular opinion of the absence of any distinctive style of the day, you have only to tell anyone that no past style should be used, and he will ask, with well-marked surprise, what can be done if it be not Classic, Gothic or Renaissance? This, perhaps, is not the worst phase, for not only is the architect looked on by the public as a supplier of old fancy dresses for buildings, but too many architects are of the same opinion. The architect, in too many cases, is believed by the public to be like a comic actor, whose business it is to parody all the expressions of former national character—from Greek to Chinese—and not to give expression to our own.

Archæology is a charming science, of great interest to everyone, and of the very highest importance to the historian; but it is not only not architecture, but when it is used as a substitute, it is fatal to it. Progress is the watchword of architecture, but with the archæologist it is the unpardonable sin. The architect's business is to improve on the past, the archæologist's to reproduce it, no matter how bad or ugly it be. The architect's canon is, that every part of a building is to be good in itself, and help to produce the proper effect. The archæologist's canon is to have precedent, *i.e.* that the modern building has been taken direct from one built ages ago. The architect of those days may have been ignorant, may have bungled, may have spoiled his building, but the archæologist is satisfied, perhaps delighted, if you can exactly reproduce these bungles.

It is surely worth the deepest thought, earnest and vigorous striving and strict self-denial to get architecture again on the line of progress, if it be possible. I by no means say that it is possible; for the wheel of fortune turns, and science, that in Mediaeval days was in the mire, is now at the top of the wheel, while art is in the mud; we have, however, this advantage over the Mediaevals, that whether we be successful or not, we shall not be burned alive for trying, though we may starve. Even when to be suspected of dabbling in science meant the chance of the dungeon, the rack and the stake, the votary of science would study it. We have, too, some encouragement for trying, for Greek art and Greek science flourished together.

Democritus, the founder of the atomic theory, was a contemporary of Phidias, and Epicurus lived in the days of Alexander the Great, when the Temple of Diana of the Ephesians was rebuilt by Dinocrates. As far as I know, there is no *à priori* reason why art and science should not flourish together, although in later times we know they have not. We should now think it absurd for eloquent writers on science to advocate the worship of the rushlight, when we have the Argand lamp, gas and the electric light; but in art we are in that unhappy position, that some of the highest eloquence of the day is devoted to the worship of the rushlight, and to the prophecy that it can never be surpassed. The eloquence we want must dwell on the inestimable benefits architecture confers, and should point to the invention of the electric light as an instance of what well-directed effort has attained. A fixed idea that no advancement can be made is fatal to all progress. So long as Ptolemy's theory was accepted as the ultimate truth, no progress was, or could be, made in astronomy; but when Copernicus, Kepler and Galileo investigated the matter, they proved that the earth was a spheroid that revolved on its own axis and round the sun, and since their day, not to speak of Newton's discovery of the law of gravitation, the knowledge of astronomy has been constantly increasing.

All the architectures that we now call "styles" could never have come into being if each nation had determined that Greek architecture was perfection, and no improvements in arrangement, construction or æsthetics could be made. With considerable gaps there was a regular advance, at least in construction

and arrangement, from Greek to Mediaeval times; it was left to the Italian artists of the Renaissance to start a belief that Roman architecture was perfect, and that all mankind could do was to try and restore it, with the effect that architecture has hardly moved from that day to this. Many observers have been sagacious enough to see that architecture is practically stationary, though the fashions have been constantly changing; but it was only quite lately that the reason, or one of the reasons, for this has been discovered—that is, that the method was wrong. The Gothic revivalists were eloquent enough, and brought the fiercest invective to bear on the Roman and Greek models; but while they advocated the change of model, they were quite contented with the method.

The question is, How are we to get the genius, capacity, skill, knowledge and taste, if there be any taste, of the present day, mirrored in our architecture? It is true we have the sculptors and painters to help us, but they can give us nothing of the present but animal and vegetable life, for the clothing of the day and the attitudes and groupings of the people are neither sculptural nor picturesque.

As regards architecture itself, we must, I think, make up our minds what we want, and these wants are twofold, material and intellectual. Let us take the material wants first. Do we want a high-pitched roof for snow to slide off? or a moderately pitched roof for rain to run off? or a flat roof? If we have a flat roof we cannot reasonably have a gable, and perhaps not a cornice. It is difficult to say whether a dome is to be looked on as a material or an æsthetic want. In a hot climate a dome not only gives increased air space, but looks as if it did, and may be useful to let in light high up, though a lantern will generally answer both purposes. It has been stated that this Byzantine feature was adopted by the Saracens as reminding them of their umbrella-shaped tents, which, if true, is an æsthetic reason; but as to whether the dome is wanted to be best seen from the inside or from the out, is certainly an æsthetic question. If it be wanted to compose with the inside it forms no striking external feature, while if it is to be an external feature it will not compose with the inside. You merely see a gap until you are under it and look up.

Everything that is palpably unreasonable in a building is a blot. We can, to some extent, by care and knowledge, arrange that we have nothing wrong in constructive shape, in area, or in arrangement; but all this I fear will not produce a building that raises high emotions; but on the other hand we know what emotions the use of most buildings ought to evoke, and that is something. It is obvious that if we were to follow a strictly reasonable method, without any thought but for utility, we should probably produce buildings that were very different from the existing masterpieces of architecture. Nature in making everything purely for use, makes most things shapely and occasionally makes them beautiful; but we by no means have nature's gifts in this respect. If we used, as we must eventually use, iron and steel for those parts which are to bear great weights, great strains, or to bridge wide spans, and made the ironwork visible, we should not only find that these materials would take new shapes, but must give rise to new ordinances. Iron, pycnostyle, systyle, eustyle and aræostyle, would be very different to those of marble columns with marble architraves. Shapeliness in iron must be reached by new proportions, and its enrichments must be different from those in marble on account of the exigencies of the material. Horizontal girders being the most convenient form that iron will take, vaulted ceilings will be superseded by flat ones, and flat roofs will be substituted for high-pitched ones.

All the large iron buildings yet put up have been merely for temporary or commonplace purposes, and have mostly been rapidly and cheaply done to meet some sudden requirement. They have not been called for by the nation for the purposes of magnificence, or for the highest ends to which buildings can be devoted, and so have scarcely entered the pale of æsthetic building. Sheds for the mere protection from the weather of people, animals, trees, or goods are not wanted or expected to raise any high emotion; but if, as we all hope, the whole bulk of the people improve as much in intelligence, morality and cultivation as they have materially, we may look forward to vast structures, not only "built for pleasure and for state," but dedicated to still higher purposes. When we have so wonderful a material as iron to our hand, the mind almost shrinks from contemplating the possible sublimity of buildings designed for the nation by the highest talent, and for the purpose of exciting the highest emotions. We picture to ourselves their colossal size, their novelty and beauty of shape, their perfection of composition, and the exquisiteness of their detail, glowing, too, with the colours of enamel, while each building is gloriously adorned with sculpture and painting. Even now the inside of the Crystal Palace is one of the most striking buildings in the world, although there was no attempt at building anything beyond a vast greenhouse.

I have the greatest possible confidence in the rising architects of the day—they be not led astray by false teaching or

demoralised by the desire of becoming rich. They have seen by travel many of the past triumphs of our art, and by photographs almost all the existing architecture in the world. They have in one respect distinguished themselves above the students of all other professions by their thirst after knowledge; for they have not only taxed themselves to get it, but organised the only complete architectural school in the kingdom. As far as they know how, they have used every exertion to acquire that deep and varied knowledge that is wanted for the most exacting profession that exists.

I doubt if the world has ever seen a failure when all have been striving to do their utmost, and it is at such times that genius mostly makes its appearance. Themistocles emerged between the first and second attempt of the Persians to conquer Greece and Publius Cornelius Scipio in the high tide of Hannibal's conquests.

If it be allowed to compare the present condition of architecture, of architectural aspirations, and of architectural instruction, with another time and a different desire, it may be said that Italy in the thirteenth century was precisely in the position that English architecture is now, for then throughout the length and breadth of Italy each poet studied all the poetry he could find, and strove to create a language in which he could enshrine the stirring thoughts and actions of his time, and eventually Dante appeared. It was at the end of such a time, among a galaxy of poets and playwrights, that Shakespeare was born. If our nation continues to cultivate the virtues of wisdom, courage, temperance and justice, whose practice has carried it so far, we may hope that it will shortly want splendid buildings for the noblest ends, and if the architects and students are still as eager, energetic and persevering as they now are, that the great architectural genius will shortly arise who is destined to carry architecture on its new path, that by that time the nation will have seen the supreme importance of architecture to mirror its greatness, its virtue and its culture, so that he may be able to create buildings worthy of his genius, and to found a school that will give to the world a succession of buildings of a vastness, an impressiveness and an exquisiteness that will cast into shade and insignificance all the architectural triumphs of the past.

STRUGGLES OF ENGLISH PAINTERS.

ON Saturday evening the prizes won by the students of the School of Art, Clapham, were handed to the students (in the absence of Mr. John M. Swan, A.R.A.) by Mr. W. L. Thomas, R.I.

In his address Mr. Thomas said:—You doubtless feel disappointed, as I do, that Mr. Swan—who has recently been so deservedly elected an Associate of the Royal Academy—has been prevented by illness from attending; but I will ask you on this occasion to be so kind as to join the band of enthusiasts who are in the habit of regarding their geese as Swans. Now, I confess that whether I take note of the high honours—I may say the extraordinary honours—fairly won by this art school, or whether I notice the all-round excellence and beauty of the drawings shown in the next room, I am fairly puzzled, and feel inclined to rub my eyes and see if I am really wide-awake in the old town or suburb of Clapham. Why I remember—we all remember—that for many years novelists, from dear old Thackeray downwards, writers of plays, “society” journalists, and penny-a-liners, when inventing and describing some particularly narrow-minded individual, or family of individuals, without a scrap of knowledge or sympathy with art, always located them at Clapham, or sometimes for a change at Brixton. Now, if those who sneer at this side of the Thames would take the trouble to cross the river and try to discover our numerous beauty spots it would be a revelation to them. Let them begin with a peep even at Battersea Park in early spring. Let them show me any view near London to compare with the lovely landscape effects to be found on those grand old commons of Streatham, Wandsworth, Mitcham, Clapham or Tooting Bec, or the charming picturesqueness still lingering around the old private grounds and gardens in this neighbourhood. This leads me to wonder whether your success is due to these beautiful surroundings or to the enthusiasm and artistic ability of many of our neighbours, men of active business habits, men like your Urwicks or Bristowes, or is it owing to the perseverance, the long-sustained note, I may truly say the high note, struck by our Nightingale (the head master)? Before distributing the prizes I must congratulate the students on their excellent work, particularly those who are not winners, for, depend upon it, it is better to be low down in a clever class than be high up among a surrounding of mediocrity. All the advice I can give to the students is contained in two words, “Take pains.” Every successful artist I know has gained his position, and held his position, when gained, by taking pains. A few instances occur to me within knowledge. Professor Herkomer has himself described, in his own vivid way, when he was desperately poor, spending his last

shilling in paying a gipsy to sit for him for detail of a small drawing on wood to make it as perfect as possible, and has described the delight he felt as he skipped down my stairs, three steps at a time, when he found his drawing had been accepted. I remember also the infinite pains he took over a pencil drawing of some Chelsea pensioners in church, which, as you know, he afterwards painted, and which, when exhibited in Paris, astonished our Continental neighbours, who, until then, never believed in the existence of a British school of painting. Then, again, all the French artists admired intensely the work of Charles Keene. Such consummate power in a few lines, they said. Ah, but the pains taken over each line; every one from nature. I often used to see him when he couldn't afford, or fancied he couldn't afford, to pay for a model, posing himself by the aid of a large mirror. One day he sent me, with a letter of introduction, a good-looking youngster, pale, delicate, French in appearance, but speaking perfect English. He made his first drawing for me, for which he received the magnificent sum of one guinea. With that guinea, he told me only the other day, he bought an illustrated edition of Longfellow's Poems and presented it to a young girl who afterwards became his wife. Her acquaintance you all have made, and her children, too, in many a graceful drawing by George Du Maurier. Again, take the career of Luke Fildes, the famous painter of the *Casuals* and *The Doctor*, who, I may confide to you, has surpassed himself in a work just completed, which, I venture to say, is the most beautiful rendering of a most lovely subject—a portrait of our Princess of Wales. What was the beginning of his triumphal career? Why, copying in black and white artists' pictures for wood-engravings. He simply did that work better than anyone else I could find, from the admirable training received in an art school similar to this. I won't detain you longer. I know you young ladies must be anxious to dance. Only let me warn you, if you wish to succeed in art, shut the door against that young scamp always interfering; you know whom I mean, the chubby young person whose full dress is a pair of wings and a bow and arrow.

DURHAM COUNTY BUILDINGS.

A QUARTERLY meeting of the Durham County Council was held last week, when a report from the Finance Committee was presented. On the subject of county buildings it said:—

With reference to the resolution passed at last Council meeting authorising the purchase of a site in Old Elvet, we have further considered the subject of new county buildings, and recommend as follows:—

1. That the offices in the new buildings be placed entirely on the ground floor and first floor, and that the basement and third floor, if any, be reserved for storage purposes, laboratories and caretaker's rooms.
2. That the new entrance to the headquarters of the county constabulary shall be by a road at the east end of the new buildings, 20 feet wide.
3. That designs for the proposed building, at an estimated cost of 30,000*l.*, be advertised for, and that premiums of 200*l.* for the best, and 100*l.* for the second best design be offered.
4. That the premium awarded for the best plan shall be deducted from the architect's commission if he be employed to carry out the work.
5. That the architect employed to carry out the work shall be paid a commission of 5 per cent., to cover all his travelling and other out-of-pocket expenses.
6. That the county surveyor do prepare instructions to competing architects, and submit them to us, and do afterwards advertise for competition plans to be sent in by June 30 next.

Mr. Brown moved that the paragraph and recommendations referring to the proposed new county buildings be eliminated from the report. In a recommendation involving an expenditure of 30,000*l.* or 40,000*l.* the Council had a right to expect that the Finance Committee had given it their full consideration before sending it to the Council. No plans were produced showing what accommodation was required, nor had the full committee an opportunity of considering the matter. It was not stated whether there was to be a public hall or not, but after the committee meeting he had, by the courtesy of one of the officials, an opportunity of seeing a sketch plan of the proposed new building. That plan even was never before the committee. He would modify his amendment so that the paragraph referred to might be held over for consideration by the Finance Committee before the latter pledged itself in the matter, and again brought it forward for adoption by the Council. He was heartily in favour of building new county offices and a county hall, but deprecated the hasty manner in which this report had been put forward.

Mr. Bartlett seconded the amendment, with regard to which he would have been more glad had it been for the omission of

the paragraph. There were many considerations why it was necessary the matter should be deliberately gone into, and why the Council should resist the action of any particular member to rush a question of this kind through with undue haste. The committee had not even considered the accommodation of the buildings it possessed. It was possible that by a small expenditure of money they could adapt the buildings they had secured to meet the interests of the Council until the measure now passing through Parliament had become law, when they would be much more likely to know what their future requirements were likely to be.

The Rev. A. D. Shafto said he was in the unfortunate position of having to defend the report. It came to this that they went to a very large expenditure in securing a site on which to build county offices and a council chamber. Their action seemed to him to be very like the man who bought a very valuable horse and then resolved that he would never ride it. There was not the slightest doubt that county offices were required. Their offices were scattered all over the town, and that court was not a suitable place for the Council to assemble in. Its acoustic properties and situation were bad. He had not the slightest objection to this matter being referred back to the committee for further consideration.

Colonel Gregson asked how it was proposed to raise this 30,000*l.*; was it from the rates or by a loan? During the last two years the county and asylum rates had doubled to what they were in the first three years of the existence of the County Council.

The Clerk said the county had at present in consols, received from county boroughs, a capital of 20,134*l.*, and an accumulation of interest amounting to 4,258*l.* They had also in consols the proceeds of the sale of the Gilesgate Militia Stores, 1,000*l.* He believed these sums totalled 25,392*l.*, and which was at present available to meet this expenditure without any charge on the ratepayers. Then they would save in rents for telephones, &c., another sum roughly estimated at 2,000*l.*, making together upwards of 27,000*l.*, as to which no charge would be made on the ratepayers.

For the amendment there were 34 votes and 24 in favour of the adoption of the report.

ROYAL DUBLIN SOCIETY.

AT a special meeting of the Council of the Royal Dublin Society the following report was submitted by the lecture theatre committee:—

The committee reviewed the correspondence with the Board of Works, from which it appeared that the Society had, in accordance with the agreement concluded with Sir John Gorst, lodged their contribution towards the cost of the theatre as far back as May 27, 1892, and that the general plans, after several conferences between the board and the committee, had been mutually approved in March 1893. The committee having learned from the Board that the work would probably begin on September 1, vacated the old theatre on that date, but tenders were not invited by the Board until December. When the committee learned the conditions under which tenders had been invited the following correspondence ensued:—

Royal Dublin Society: December 16, 1893.

Sir,—The Council of the Royal Dublin Society observe in the invitations to tender for the erection of the lecture theatre recently issued by the Commissioners it is stated that if the amount of any tender the Commissioners may entertain "exceeds 9,000*l.*, the excess must be reduced in the manner to be pointed out by the Board."

The Council had not contemplated that it would be proposed to so limit the expenditure, and they desire to reserve to themselves full liberty to object to any alteration which may tend to reduce the accommodation, structure or fittings shown on the plans, which have been approved after several meetings by the Commissioners and by the committee of this Council, and before any such reduction takes place they desire to have an opportunity for expressing their views upon the matter. The Council therefore desire me to ask that such tenders as the Commissioners may propose to entertain, together with the plans, specifications and bills of quantities for the work, shall be submitted to the Council for their consideration and observation at the earliest opportunity and before any decision is arrived at by the Commissioners.—I am, &c.,

RICHARD J. MOSS, Registrar.

The Secretary, Commissioners of Public Works.

Board of Works, Dublin: December 20, 1893.

Sir,—In reply to your letter of the 16th inst. I am directed by the Board to state for the information of the Council of the Royal Dublin Society that the figure of 9,000*l.* refers exclusively to the proposed expenditure on the structural portion of the new theatre as covered by the contract for which invitations have been issued, and has no bearing on other items of outlay

provided for in the estimate of 10,000*l.* originally laid before the Treasury.

It is not proposed to reduce in any respect the accommodation, structure or fittings agreed upon between the Royal Dublin Society and the Board, and the arrangements made on these matters will, it is needless to say, be strictly adhered to. If from any circumstances it should appear advisable to this Board to further consult with the Royal Dublin Society after receipt of the tenders, they will avail themselves of an early opportunity to do so.—I am, &c., P. J. TUOHY, Secretary.

The Registrar, Royal Dublin Society.

An interview then took place between the Commissioners and some members of the committee, and they were confidentially informed of the amount of the lowest tender which the Commissioners had received. The committee thereupon wrote to the Board and received a reply as follows:—

Royal Dublin Society: January 9, 1894.

Sir,—With reference to the recent interview which members of the lecture theatre committee had with your Board on the subject of the tenders for the theatre, I am requested to inform you that the matter has since received the very careful consideration of the committee. They attach the greatest importance to being placed in possession of full information as to the internal arrangements of the proposed building, and particularly those essential to the efficiency of a well-adapted lecture theatre and laboratory. I am to point out that some members of the committee have special knowledge on such matters.

With this object the committee wish to be informed whether the Board will be prepared when they have obtained a tender which they propose to submit for the approval of the Treasury, and before taking any action in reference thereto, or entering into a contract, to submit the plans and specifications with particulars of proposed alterations for the consideration of the committee.

The committee desire me to assure you that they are most unwilling to increase the difficulties of the Board in carrying out the work, but as the Society is contributing largely towards the cost of the work the committee feel that they are not unreasonable in asking for this information.—I am, &c.,

WALTER BOYD, Hon. Sec.

The Secretary, Commissioners of Public Works.

Board of Works, Dublin: January 12, 1894.

Sir,—In reply to your letter of the 9th instant relative to the plans, &c., for the erection of the lecture theatre, I am directed by the Commissioners of Public Works to assure your committee that, as already intimated to the Royal Dublin Society, they will abide by all guarantees previously given, and if there be any point in reference to which they think it desirable to consult the Society again before accepting a tender they will not fail to do so.—I am, &c., P. J. TUOHY, Secretary.

The Honorary Secretary, Royal Dublin Society.

It was then resolved:—

That the Council of the Royal Dublin Society view with great regret the course proposed to be pursued by the Commissioners of Public Works as shown by the correspondence now placed before them. The Council having contributed 5,000*l.* towards the erection of a suitable lecture theatre claim the fullest information regarding the plans and specifications upon which tenders were invited and the particulars of any deviation proposed therefrom with a view of reducing the cost; and protest against the withholding of information which would alone enable the Council to see that the arrangement under which they contributed the above sum was fairly carried out.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

THE eleventh annual meeting of the Lancashire and Cheshire Antiquarian Society was held on January 26 in Chetham College, Manchester, Mr. J. Holme Nicholson presiding.

The Council, in their report, congratulated the members on the continued activity of the Society, as evinced both in solid archaeological work and in attendances at the summer excursions and winter meetings. The volume just issued would, it was hoped, be found worthy of its predecessors. The very full index to the ten volumes of the transactions of the Society, and the index of the papers published by the archaeological societies of the United Kingdom in 1891, had occasioned considerable delay in the publication, but had added great value to the volume. The Council offered their thanks to the feoffees of Chetham's College for the use of meeting-rooms, and to others who had been of service to the Society. The number of members continued to be very satisfactory. There were 275 ordinary members, 47 life members, and 6 honorary members, making a total of 328—a slight increase on the previous year. The name of Mrs. Linnaeus Banks,

who had done so much to popularise history of a local nature by her novels, had been added to the list of honorary members. Details were given of the various meetings held during the year. One result of the exhibition of corporate insignia at the *conversazione* given at the Manchester Town Hall, in December, was the formation of a committee to collect subscriptions with a view to the presentation to the Corporation of Manchester of a civic mace and, if funds permitted, other insignia. The archaeological survey of Lancashire had been completed during the year by Mr. W. Harrison, with the assistance of members and others resident in various parts of the county. This work was of the highest importance, and the cordial thanks of all antiquarians were due to Mr. Harrison. The Ecclesiastical Committee had held several meetings during the year. They had issued a circular to the rectors and vicars of the various parishes, and hoped shortly to publish a report detailing the results of their inquiries. There was a possibility that the congress of the British Archaeological Association might be held in Manchester during the ensuing summer. The Council expressed their obligations to Mr. C. W. Sutton, who for eight years had been editor of the transactions of the Society, and also to Mr. G. C. Yates, the honorary secretary.

The Duke of Devonshire was elected president of the Society, and the following gentlemen were elected vice-presidents:—Mr. J. Holme Nicholson, Sir William Cunliffe Brooks, Dr. H. Colley March, Professor Boyd-Dawkins, Mr. C. W. Sutton and Mr. W. E. A. Axon.

Mr. Thomas Letherbrow was elected treasurer and Mr. G. C. Yates hon. secretary.

Mr. Albert Nicholson called attention to the paragraph in the report with regard to the proposal to present a mace to the Manchester Corporation. At the *conversazione*, in December, at which corporate insignia were exhibited, it was stated that Manchester was almost alone among corporations, great or small, in having no mace and, in fact, no insignia of any kind with the exception of the mayoral chain. The opinion was then very generally expressed that this was a matter which ought immediately to be put right. The members of the Antiquarian Society, it seemed to him, were the right persons to take the initiative, and he had accordingly brought the matter before the Council of the Society. A committee had been appointed, who were now appealing for subscriptions, which would not be limited to members of the Society. It was proposed to get the very best man they could to design the mace. A mace was really a symbol of the delegation of royal authority, and was carried before the Lord Mayor. In the case of a visit from the Queen the mace would be carried by the Lord Mayor in front of Her Majesty. The committee were anxious to get the matter settled at once. A very important civic function was in prospect, and it was desirable that the Corporation should have the mace before that time.

CELTIC INTERLACED WORK

AT the meeting of the Kildare Archaeological Society, which was held last week at Naas, Mr. Thomas Cooke Trench read a paper on "Interlacing Ribbon-Work." He traced the mode in which the patterns were built up, which adorned not only the crosses and other works in stone in Ireland, but also the metal-work. In building the church of St. Michael's, in the adjoining parish, which was Irish from the foundation to the roof, he had sought everywhere for examples of this work; but he was much exercised, first, by the small number of suitable patterns available; and, secondly, by the thought why they should be confined to a servile reproduction of old patterns. Why should not they be able to produce patterns as well as these men of old? He had tried to produce what he thought beautiful patterns; but always just as he was bringing one to a finish some fatal crossing appeared, and the whole thing was a wreck. It was plain that there was some fundamental principle which, if one could only grasp it, would leave the rest easy. Suddenly it flashed upon him what the underlying principle must be. He tested it and found it to work. Since then he had made many drawings, not a few of which were reproduced in St. Michael's Church. He subsequently found that Mr. Romilly Allen had made the same discovery, and had communicated it in a paper read to the Society of Antiquaries of Scotland. An example of the work was shown, taken from the cross of Tuam, and perhaps the most perfect example extant of this especial kind of work. If they began at one corner and followed the ribbon throughout, they would find that, while it wandered in apparently the most aimless and reckless way about the surface, by the time they arrived back at the point from which they had started it had arranged itself into an intelligent and orderly pattern, devoid of repetition, but containing a general harmony throughout, one knot or twist balanced by a corresponding though totally different one, and all through the ribbons crossed one another

alternately, under and over, without a single break. In explaining the process he stated that the artist first covered the space to be dealt with with lines crossing one another, and woven in and out like basket-work. He then proceeded to join all the ends, two and two together, and finally he obliterated crossings here and there, joining the ends thereby set free in a manner different from that which they originally followed. Anyone could join the ends and obliterate the crossings, but the excellence of the pattern consisted in the skill with which these processes were carried out, and in that lay the art. Mr. Trench showed several other patterns of ribbon-work and explained the manner of their construction, but in speaking exclusively of the endless ribbon he did not wish it to be supposed that he gave it any undue preference over other and still more beautiful forms. He had merely sought to show how one very curious, beautiful and characteristic kind of decoration was produced, and to render simple and easy that which without explanation looked like an insoluble puzzle.

MUNICIPAL BUILDINGS, NEW YORK.

THE Advisory Board of Architects, consisting of Professor William R. Ware, N. Le Brun and Mr. E. H. Kendall, have presented a report to the Municipal Building Commission on the designs sent in for the new buildings. They say:—

We have the honour to report that the 134 sets of drawings submitted in competition for the municipal building have been examined by us, and those of them which seemed most commendable, whether in plan and arrangement or in external appearance, about thirty in number, have been carefully studied.

The six numbered 13, 23, 28, 35, 107 and 113 seem to us upon the whole the best, whether in respect of external appearance or of practical convenience.

But no one of them is perfectly satisfactory, and whichever design may be finally selected by the Commission, it will have to undergo considerable modification before it can meet their reasonable requirements.

Four of these exhibited steep roofs and follow in general the type of civic building of which the most notable example is the Hôtel de Ville, Paris. One of these has the whole upper storey in the roof, three have it partly in the roof; of the other two, one exhibits four full storeys above the basement, the roof being arranged flat. This design shows a high tower. Two of the six place the principal entrance nearly at the level of the ground; three set it up fifteen or twenty steps, with an equal number of steps on the inside to reach the level of the first storey, and one places it on the level of the first storey, which is reached by external flights of thirty steps.

In four of these designs the rooms and offices on the front and rear of the central mass of buildings are divided by a corridor 12 or 15 feet wide, which runs the whole length from east to west. In two of them the corridor is replaced by a central hall with narrow corridor and galleries on either side opening into it. In the remaining one is a similar arrangement in plan, but the wide central area is not roofed and forms a couple of internal courts for light and air.

In five of the designs the Governor's room is set in the middle of the front in the second storey; in the other, also in the middle of the second storey, but at the rear.

In two of these designs the council-chamber is set in the middle of the eastern front, upon Centre Street; in two, at the northern end of the eastern front; in one in the main front, but at the side of the centre, and in one also in the main building, but at the centre of its rear or northern face.

The main staircase, in three of the designs, is opposite the main entrance; in three there are two staircases placed symmetrically to the right and left of the central hall.

All the designs show a considerable extent of corridors lighted by borrowed light. In a building of this extent and elaborateness this can hardly be avoided, and though some of the drawings show more windows in the partitions than others, so that these corridors seem to be lighted, this is an unimportant distinction and not necessarily a ground of choice between them. Whatever means of lighting corridors is the best can be as well used in one design as in another.

Of more importance is the lighting of the rooms, and preference has been given to the plans in which the rooms are comparatively shallow. From this point of view it is better to have the corridors in the middle of the building or wing than along one wall, for, though not so well lighted itself, the rooms it divides are of a better shape.

It is not to be expected that any one of these designs, just as it stands, would be satisfactory from every point of view. The purpose of competition will have been answered if any one of them is found to be acceptable as a whole and is susceptible of such modifications as further study and conference with the city authorities will make entirely satisfactory. This is presumably the case with any one of the six designs herewith submitted.

Colour in Architecture.

SIR,—When, as of old, shall we see the glory and the charm of colour in our external architecture?

About a year ago a dozen leading men joined together in writing a book claiming modern architecture as an art, yet I believe that not a word was said about colour, perhaps for the very simple reason that nothing can be said of what has no existence; but I make bold to say that if this beautiful and never-wanting characteristic of ancient architecture could have been claimed by one or more of these eloquent writers as distinguishing the art of these days—well, the book need not have been written. Architecture with colour is, or may be, a fine art; without it, only a science, a practical art, a business or a profession.

The last half-century has witnessed the advanced education of our travellers and explorers as compared with those of the days of Stuart and Revett, who lived when purity or uniform whiteness was considered to be architectural beauty *par excellence*; but since then proofs have been published over and over again in the glowing works of Victor Place, Layard, Penrose, Pulgher, Texier, Stothard, Ongania and Mallay, that once upon a time, and for centuries of time, there was scarcely such a thing as architecture—external or internal—without rich colours. Harmony was secured and vulgarity avoided by the fearless use of at least two colours associated with black and white. People in those days would have been as surprised to see a monotone building of any more importance than a labourer's cottage as to see a leopard without his spots, a tiger without his stripes, the trees all grey, or that for some unaccountable reason the allwise Creator had changed "polychrome moths, humming-birds, gold-fish, roses and violets into one uniform tint." So essential was colour in the opinion of the Athenians that they treated the beautiful marble of Pentelicus in their temples very liberally with it. If, then, the above architects still find any difficulty in convincing the British public (as we suppose they have, or they would not have written the book) that they are artists first, and practical or professional men afterwards—that they really understand architecture as a fine art, that it is something more than a business—let them at once take vigorous measures, by establishing a society of painter-architects or otherwise, so that our thoroughfares shall, as soon as may be, display the ancient, necessary and lovely art of external polychromy. I am aware that men who never had a brush in their hands, or who by nature have no eye for colour, tell us that our dull and changeable climate is opposed to this idea. I venture to say—for the mere purpose of argument, for the sun and cloud effects of Britain are beloved of the artist—that paucity of sunshine is a reason not for the monotonous treatment of architectural façades, but for the boldest polychromatic effect, *e.g.* like that adopted in ancient times in the changeable and stormy regions of Auvergne and the Puy de Dôme, illustrated by M. Mallay; in Bavaria, where Charlemagne founded the abbey of Lorsch, with its external walls, as shown by Moeller, glowing with coloured mosaic; and in Munich, where colour is at this day a striking characteristic of modern external architecture. Besides, if the question of durability must be raised, have we not everlasting colours of all tints in the numerous porphyries, granites and serpentines of the United Kingdom, and means of working them in the most economical manner, which only want using with a student's knowledge and with artistic feeling, instead of in the present manner of a builder's apprentice of tender years? Indeed, science is daily revealing to us how wonderfully nature's works are invested and adorned with the loveliness of colour. It is everywhere. Take a ton of coal—of cannel coal. Pure and simple, it is not a beautiful object, but what lovely hues are latent within it. All tints of mauve and magenta were discovered by Perkin thirty-six years ago, and Roscoe has since extracted yellows, reds, blues, greens, violets, besides a number of browns and an infinity of blendings of all shades, with the result that a ton of coal thus chemically treated is worth 100*l.* sterling. As architects we may, if wise, take a hint from this, for perhaps our work, similarly converted from monotony to polychromy, might command improved terms equivalent to a fine art architecture. Certain it is that all architecture, worthy of the name, has its basis in nature; therefore it is undeniable that colour must form part of it, as we know it did in all ancient styles, and until it is again adopted as one of its characteristics, no less important than light and shadow, modern architecture will fail to rank as a fine art. But seeing what Englishmen do with the brush I do not despair of the event, which will be a golden wedding indeed. Then will the architectural room at the Academy become thronged instead of, as now, avoided; then will the nursing mother of all the arts take, as of right, her long

vacated seat—her cathedra—and be appreciated and beloved of the people for her own sake, instead of, as at present, parading in borrowed plumes and exciting contempt.

January 29, 1894.

HERMES.

GENERAL.

The French Commission on Theatres have decided that the directors of the Opera House, Paris, are to be allowed the use of a gallery in the Palais de l'Industrie, in which to prepare scenery to take the place of the canvases consumed in the Rue Richer.

A Prize of 1,000 marks will be henceforth offered annually by the Emperor of Germany to promote the study of ancient Greek art. The first subject will be a restoration of the head of one of the female figures from Pergamos.

The Recent Admissions to the Royal Academy Architectural School are Messrs. W. A. Brown, F. D. Clapham, S. E. Cook, A. R. Hamilton, W. Hawke, J. Kirkland, W. Mackinnon, E. J. Richmond.

An Estimate has been prepared for the construction of a new chamber for the French deputies, which amounts to 4,500,000 francs. The existing *salle* will be used for conferences.

Herr Robert Koldewey, architect, of Hamburg, has been nominated as doctor in philosophy by the University of Freiburg, in recognition of his inquiries into the history of Greek and Oriental architecture.

M. Pierre Cavelier, the sculptor, and for many years professor in the Ecole des Beaux-Arts, has died in Paris in his eightieth year. He was a pupil of David d'Angers, and in turn taught several of the principal French sculptors.

The Restoration of Swansea Church is to be undertaken at a cost of 25,000*l.* from plans by Sir A. W. Blomfield & Son.

The Guardians of the Walsall Union are not likely to appoint a professional assessor in the competition for the infirmary buildings.

The Painting known as *Le Roi s'amuse*, which was a too characteristic work of the late Jules Garnier, has been accidentally torn in shreds while being stored in St. Louis.

The Premiated Designs for the Rossville Asylum, New South Wales, have been despatched to Mr. C. H. Howell, in London, for report. The local judges were the Government architect, the president of the Colonial Society of Architects and a medical doctor.

An Exhibition of Japanese lacquer and metal-work will be open at the Burlington Fine Arts Club until March 31.

The Fourteenth Exhibition of Paintings in Toynbee Hall, Whitechapel, will be held during the three weeks of the Easter holidays. Pictures will be received up to March 16.

Gray's Inn Chapel was reopened on last Sunday after restoration, which was carried out under the direction of Mr. C. H. Shoppee.

Mr. T. Taylor Scott has prepared plans for the improvement of Fisher Street Presbyterian Church, Carlisle, which have been adopted.

Mr. Gourlay Steell, R.S.A., the animal painter, died on Wednesday. He was a brother of Sir John Steell, the sculptor.

Mr. J. C. Brooks has presented to the Newcastle Society of Antiquaries his collection of portraits and autograph letters in twenty cases. They include portraits and autographs of sovereigns from Henry VII. to Victoria (excepting Mary and Edward VI.), most of the Anglican archbishops and bishops, of Sir Godfrey Kneller, Hogarth, Pope and Wellington, the presidents of the United States, including Washington, &c.

A New Ward is to be added to the Halifax Infirmary at the cost of the Rawson family, at an outlay of about 5,000*l.*

Mr. C. Lonsdale read a paper on "Some Trees and Their Uses" at the last meeting of the Carlisle Architectural, Engineering and Surveying Association.

Josef Israels, the Dutch painter, has received from the Queen Regent the Order of Orange-Nassau, on occasion of his seventieth birthday on the 27th ult.

The Ancient Curfew Tower at Barking is now falling into decay, and it is proposed to restore it.

The Annual Report of the Liverpool Art Club has been issued, showing a membership of 213, improved financial circumstances, and stating that the work done has been most satisfactory.

Mr. Basil Champneys will read a paper on "The Relation of the Ideal to the Practical in Architecture," at the meeting of the Liverpool Architectural Society on Monday, the 5th inst.

Mr. W. Henman presided at the meeting of the Midland Arts Club, Birmingham, on Tuesday. The election of officers for 1894 resulted in the appointment of Major C. J. Hart, president; Messrs. W. J. Wainwright, A.R.W.S., W. J. Morgan and W. Doubleday, vice-presidents; Mr. F. H. Stead, treasurer; Mr. W. H. Vernon, hon. sec.; and Mr. H. Cheadle, hon. curator.

The Architect.

THE WEEK.

AMONG the recent purchases of the London School Board is the Old Palace site in St. Leonards Street, Bromley-by-Bow, for the erection of a new school. The Works Committee are informed that the building which was on this site was formerly an Elizabethan mansion of ancient structure, and contained among other interesting relics a fine carved oak chimneypiece, standing the whole height of the room. The old materials of the building, which would under ordinary circumstances have realised only a small sum, were sold in this instance for the sum of 256*l.* A letter has been received from the Society for the Protection of Ancient Buildings, drawing special attention to the great historic interest attaching to various parts of the building. The chimneypiece referred to above is now in the possession of Mr. BINNS, of Brompton Road, who has given the architect of the Board the refusal of it for 150*l.* The committee are of opinion that this chimneypiece should be repurchased, and should be placed in one of the halls of the new school to be erected on the site, thus carrying out the principle contained in the following resolution, which was passed by the Works Committee on March 14, 1892:—"That it be an instruction to the architect, in planning schools upon sites having historic interest, to insert a tablet recording the circumstances connected with the site in some convenient situation, the wording of the proposed tablet to be submitted to the Works Committee for their approval."

THE Bolton Town Council on Wednesday approved of a wise resolution of the Streets Committee. It appears that some 'cute architect contrived to gain access to the plans which had been deposited with the Corporation. He made a copy of one which was employed as evidence in a lawsuit against the people for whom it had been prepared. It was denied by all the officials that permission was given to make a copy. There was a suggestion given that under the circumstances the copying was a criminal act, and every honest architect will regret that some steps were not taken to expose if not punish the guilty party. The Town Clerk considered the copying was only a breach of faith. The Streets Committee decided, and their resolution was endorsed by the Council, that henceforth plans must not be inspected without the consent of a proper authority. We hope the officials elsewhere will adopt a similar precaution.

BUILDING exchanges have become an indispensable institution in the United States, and Mr. R. J. BENNETT could not therefore have selected a more apposite subject for the paper he read before the architectural section of the Philosophical Society of Glasgow on Monday. He said that these exchanges had been founded in the belief that more intimate social relations would tend to check the bitterness of rivalry and keep the eagerness of competition within reasonable limits, while at the same time enabling the members to gain knowledge from the experience of others. The exchange at Philadelphia was selected as representative of those which were found in the principal American cities, and was described at length. The corporation of the exchange was composed of employers in trades that have to do with the construction and finishing of buildings; and the exchange was also intended for the use of architects, surveyors and dealers in all necessary materials. In Glasgow, Mr. BENNETT said, they had long felt the need of such an exchange, owing to the difficulties that often arose when one employer wanted to see another as to the work in which they were both engaged. Such an institution would raise the status of the various trades connected with it, and though it might take a year or two to get into working order, he believed that it would soon prove of immense advantage. He stated that in America the architect completed his plans of the building to be erected, the surveyor or measurer took off the quantities, and then the plans and specifications were sent to the secretary of the exchange with names of builders selected, if more than one was invited, to contract. That in-

formation was imparted to all the contractors. As architects there as well as in this country had a habit of altering the plans during construction, the secretary took the precaution to photograph them. The offers were opened by the architect in presence of the offerers, and the lowest, being found to be correctly figured, he generally got the job, provided he was a member of the exchange. Another benefit that the exchange conferred was that payments were made at regular intervals, fixed at the time when the contracts were entered into, and that the measurer was kept up to the mark and not allowed to lag behind. The architect also was protected, for if he ever found out that the specifications were not being complied with, he had only to inform the secretary of the exchange and the matter was at once investigated by the directors and put right. It would thus be seen that the exchange would soon put an end to shoddy work and shoddy-work prices, and the public would have more confidence in the tradesmen they employed, while a better feeling would be established between architects, surveyors and tradesmen.

BUILDERS, and especially contractors for painting, would appear to have broken an Act of Parliament with immunity for over forty years. This strange fact was discovered by Dr. THOMAS, the coroner for the Paddington district. At an inquest held on the 2nd inst. upon the body of a labourer who fell from a window-sill while engaged in removing a ladder, the coroner pointed out that ordering a man to stand on a window-sill was illegal. Section 28 of 10 and 11 Vict., c. 89, enacted that "every occupier of any house or other building, or other person who orders or permits any person in his service to stand on the sill of any window, or upon any house or building within the said limits, is liable, unless the window be in the sunk or basement storey, to a penalty not exceeding 40*s.*, or, in the discretion of the justices before whom he is convicted, to be committed to prison for a period not exceeding fourteen days, and any constable by virtue of this Act shall take into custody without warrant, and forthwith bring before a justice any person who within his view commits any such offence." The coroner could not decide whether the Act applied to all England, to London alone, or to the provinces, but there was no doubt that the prohibition was on the statute-book. The builder who had employed the man said he could not understand how work was to be done under such conditions, and as the Act has been allowed to fall into desuetude, it would appear as if the authorities were also of that opinion.

SOME explanation of the connection between the place-names of the Angles and dwellings was given a few evenings ago by the Rev. H. KINGSFORD in Worcester. The termination "ton" or "tun" was frequently found. The "ton" was first a single dwelling, a farmhouse it might be, and such was the meaning of the word still in the north. When the Angles dispossessed the Romano-British occupants of the country, each man had first to build himself a rough shanty or dwelling. He had to secure himself against wild animals and against the men he had dispossessed. To do that he threw up a mound round his house, and where the earth for the mound came from there would be a ditch or dyke, on which stakes would be placed. From the points or "tines" of his stockade or brushwood hedge came, some said, the name "ton" or "tun"—a place protected by "tines." Perhaps it was called after his own name or some name in the old country, or by a name describing the natural features of the place, or its relative position to some other "ton." Then he would want a secure place for his crops. He would make another "ton," the "bere-ton," or the "bar-ton." Further, he would want a place to tend his cattle—a home-pasture. So he made a "tining"—an enclosed "ing" or meadow. The Angles must have been, judging from their place-names, an unimaginative if aggressive race. They were not unlike the stolid Dutch and German settlers at the Cape and in the Transvaal. There was little variety in their place-names. Over and over again they found Northtown (Norton), Southtown (Sutton), Easttown (Easton or Aston), Westtown (Weston), though one or other of these names in a particular district or tithing might have passed away with the thing itself.

RISKS IN QUARRYING.

AS geology is the healthiest of all scientific pursuits, it is allowable to conclude that workmen who are engaged in quarrying do not labour under as many insubstantial conditions as the men employed in the majority of trades. It is found by a comparison of statistics that the death-rate of slate and stone quarrymen "is precisely the same as that of the medical man, and is lower than that of cabmen, bargemen, carters, law-clerks, butchers, hairdressers, bookbinders, plumbers, glassmakers and others." At the present time there is, however, a belief that by some exertion of authority every calling could be cleared from inconvenience, and the quarrymen may be excused if they demand arrangements which would enable them to live longer than medical men. FREDERICK THE GREAT could not understand why his youngest soldiers should have any fear about coming close to the enemy, for their hesitation indicated a desire to live for ever, which he considered to be unphilosophical. In our time, on the contrary, the unfittest have an ambition to survive as long as the fittest. The quarrymen, who are very useful members of society, were only acting like their fellow citizens when they clamoured for an official inquiry into the "conditions under which the quarrying of stone, limestone, slate and clay is conducted, with the object of diminishing any proved dangers to the life and health of the workpeople engaged therein."

The said workpeople are sufficiently numerous to possess a voting power that is not to be despised. According to the census returns they numbered in England and Wales 102,369 in 1881, and 105,796 in 1891. The increase is insignificant, but we may be allowed to remark that it indicates one of the mysteries which are always found in statistics. It might be supposed that as in the decade in question brick buildings and terra-cotta ornamentation were in unusual favour, there would be a large increase in the number of "clay works, including brickmakers." It so happens that, on the contrary, the number of workers under that head has decreased from 54,919 to 49,584, while the stone quarriers have increased from 28,870 to 36,813. More curious still is the fact that the plaster and cement workers, in spite of the decline in the adoption of cement fronts for houses, have increased from 3,680 to 5,636.

The Quarry Committee, having visited a great many districts, believe they have gained a general idea of the conditions under which quarrying is being carried on at the present time. They have, therefore, lost no time before drawing up a code of special rules, which are designed to prevent accidents and to mitigate their effects. We have as strong a desire as any of the professional philanthropists to see risks to life or health diminished in all trades, but everybody who has had acquaintance with quarrying will have no hesitation in saying that in this country at least the dangers arise from the carelessness of the men, and as long as that exists (or while the human race remains as it is), remedial measures can be no more effective than those which might be proposed for the benefit of boys and babies. Familiarity breeds contempt, and in no place is the proverb more strongly exemplified than in an ordinary quarry. The men have become so accustomed to overcoming the cohesion of rocks, they only realise the possibility of death or maiming as a remote contingency. In mines the case is different. There the danger arises from an invisible enemy, and by taking precautions, which can be insisted on by managers and overseers, it can fortunately be minimised. The quarryman has no fear of firedamp; his enemy is colossal, but palpable, and the flaws and other weak points in it only make him despise it. If there is anything to be feared in quarrying operations it might be supposed to be blasting; but there is a class of men—and, we imagine, hardly a quarry is without representatives of them—who are so foolhardy in dealing with powder as to appear irrational. They cannot be convinced that the force in powder may be latent. If it will not "go off" they imagine it can be tamped with impunity, and it does not always happen that they are made cautious by an accident.

The evidence relating to Welsh quarries which has been selected to accompany the report of the Quarry Committee will, to the initiated, confirm what we have said, although many tender-hearted people who are not acquainted with

the way in which stone is obtained may imagine that the witnesses have spoken about a sort of daily martyrdom. The truth is, that until recently the quarryman was far more happy and contented than any of the workmen in towns. He has been operated on by agitators, and he has come to the conclusion that he must have grievances. What they are is not clear to him, but at least his pride will be satisfied if the Government will interfere. An extract from the evidence of one of the quarrymen will suggest the indefinite character of what is sought:—

Are you satisfied that everything that can be done to prevent accidents is done, or is there anything you can suggest?—We want more care and more authority to command obedience to the rules. We also want experienced men, as the quality of the rocks differs so much.

Are your officials experienced men?—Yes, they are practical men.

Then what do you mean by saying that you want experienced men?—The great drawback is that the most experienced men do not take any notice of any man's bargain but their own.

But you said you wanted experienced men, and you say that the officials are experienced; what more do you want?—We want one to look after them all.

Do you mean a Government inspector?—I think that would be the right thing, if sufficient authority were vested in him to compel obedience to the rules.

It might be supposed that the men would realise that most (accidents when not arising from their own carelessness) are due to causes which cannot be foreseen. Rocks are subject to actions which take place within the beds, and cannot always be safeguarded or prevented by the closest examination of the exterior. If a Government inspector were stationed in every quarry, however small, he could not always anticipate the slipping of stone any more than he could prevent one man from allowing a stone to fall on his neighbour. Yet a man who has been working for forty-five years, thirty-two in one quarry, like many of his fellows, considers, although he has gone scathless, that the only chance for safety is by placing all the quarries under Government officers. In his evidence he states:—

You say you want the quarries under Government control?—Yes.

What reason have you for that?—Because there is not sufficient supervision. We do not approve of the method of working the quarry.

Who are the persons who do not approve of the mode of working the quarry?—We as workmen.

And do you suppose that a Government official would show you a better way of working than the owners and the men themselves?—I do not know that. It is an old method, and rather difficult to improve upon.

Do you mean to say you do not approve of the mode of working, and yet you say it is difficult to improve upon?—There is a better method, but I do not know what the expense of adopting it would be.

You propose that the quarry should be worked under Government management?—Yes.

Do you believe the Government management would find those ways out better than the owners themselves?—If they gathered all the rubbish from one sink to a certain place, to a kind of incline, it would be better.

Instead of the system now in force?—Yes.

You say that no one examines the places to see if they are dangerous?—No, not regularly.

In comparing Government inspection with the inspection of the workman and employer, you say the employer's official goes round once a day, and that the workman is there every day; which inspection is best, the inspection of the workman who is constantly there, and the official who visits the place once a day, or the Government inspector who would come periodically?—I do not know what work the official would do. The workman goes to his work in the morning, and works until late, and has no time to look about him.

The Government must be flattered by such confidence in officialdom. But ordinary people, who have to pay for such control, would hardly care to hand over their business to the civil or military experts of the Science and Art Department, that would probably monopolise the quarries like other things. If men were being constantly maimed through the indifference or the niggardliness of quarry owners, there might be reason for the Government to interfere. But, according to their own account, accidents rarely occur. One witness said his finger was once slightly cut, but however we may sympathise with such catastrophes, it is hardly necessary to revolutionise business in order to obviate them.

It may be granted that more safety would be insured if the men could be persuaded or forced to be less foolhardy. The manager of a slate company pointed out one way of meeting the case when he said, "It appears to me that what is wanted is a rule binding the men to take necessary precaution, and empowering the employer to prosecute any workman found disregarding it, as a collier is prosecuted for

wilfully taking matches into a mine." He also remarked that "if a rule is passed which puts any liability upon the employer for the wilful act of the men, it would work great injustice." It would be necessary to increase largely the number of stipendiary magistrates if every neglect of a rule were to be followed by a prosecution. The men are too much accustomed to their own ways to tolerate a rigorous control of that kind.

It will be said that the death-rate among quarrymen is about 12 per cent. higher than the mortality of "all males" in this country, and that circumstance is proof of the existence of evils which are probably remediable. Again, quarrymen are much above the average in mortality from phthisis and diseases of the respiratory organs, being nearly three times in excess of fishermen. The numbers are 198 for fishermen, 337 for carpenters and joiners, 453 for builders, masons and bricklayers, 462 for wool-workers, 543 for cotton-spinners, with 582 for quarrymen. The cause to which the abnormal mortality is ascribed is the inhalation of stone dust, which operates to a more terrible extent among potters, for their death-rate from lung diseases ascends to 1,118. There is a worse figure for the Cornish miners, viz. 1,148. The Sheffield trades are commonly supposed to have an unenviable position in statistics of that sort, but as for knife and scissor-making the number is 760, and for file-making 783, it is evident that quarrying is worse. It must be also acknowledged that alcoholism, liver diseases, nervous diseases, &c., are not prevalent among them, and according to Dr. OGLE, the late superintendent of statistics, "the mortality figures tend to show that the quarrymen are a set of strong men, who live a healthy life, with the exception of the inhalation of dust and the liability to accident."

If the conclusion be correct it is much to be regretted; but it is hard to see how Government officers could prevent the inhalation of minute particles of stone or compel them from operating injuriously on the respiratory organs. The use of respirators or the practice of breathing through the nose might diminish the evil, and quarrymen could make the experiment without compulsion. Science may some day discover some other means of preserving men against the consequences of following dangerous trades, but unless we go back to the savage or golden age we must put up with them. Every application of materials in manufactures brings misery with it. No committee can devise means of neutralising an evil which is inseparable from quarrying. If the high death-rate were due to accidents there would be some reason for interference.

It does not follow that the evil is to be allowed to grow. Something can be done, but it must be by the quarrymen themselves. Their indifference to consequences is not confined to the quarries. When we find a doctor saying he has had more cases which could be attributed to exposure at funerals than to working at the quarries, it becomes plain that the men care little about the effects of the weather. They will not take the trouble to change wet clothes, and they sometimes sleep in them. One of the doctors said that where the men were provided with oil suits they would not use them. The houses of the quarrymen, especially in Wales, are guarded against the admission of air. The food is also of a kind which does not promote vigour, but predisposes towards disease. In no part of England is instruction in the conditions of health more needed, and until it is imparted a high death-rate will prevail in the slate district.

The Committee in their wisdom have recommended that refectories should be provided and places for drying clothes, that the hospital accommodation should be increased, that instruction should be given in ambulance work and to the wives and daughters in nursing and cookery, also that means of recreation should be facilitated. All the proposals may have their advantage, but they will convince the men that the quarry-owners have been neglecting their duties to their employés.

More remarkable are the proposed precautions to insure the safety of the men. Accidents are rare, and in nearly every case they are caused by a neglect of established rules on the part of the employed. The Committee, however, recommend clearance of loose ground or material, additional width in "galleries," wide and clear spaces on both sides of tramways, and the introduction of fencing wherever

there is room for it. In blasting wooden rammers are to be substituted for steel. An efficient system of signals is to be established, to notify when blasting is about to commence and when it is completed. We agree with the proposals that "after firing a charge of any explosive, no further charge is to be introduced into the hole, or into any rent, until after the lapse of twenty minutes," and that "if a shot has apparently missed fire, no person shall be allowed to go near until after the lapse of half an hour." But as the responsibility is cast upon the owners alone, we cannot see how in large quarries the arrangement will work. It would be necessary to have an overseer watching every hole, and the keeping men idle for an indefinite time during every day. The advantages would be infinitesimal. If operations in quarries were carried out by little girls, it would be prudent to watch over them; but as with men there are few risks, we can only consider the recommendations as exemplifying Lord MELBOURNE's apprehensions about the danger of a policy which insisted on "something being done" at any cost.

CONSTANT TROYON.*

IF slanderous and baseless accusations (like those of CHARLES KINGSLEY) had compelled CONSTANT TROYON to write a sort of autobiography, it would bear a resemblance in one way to the "Apologia pro Vita Sua." The Oxford divine seemed to take pleasure in convincing himself that he owed his powers to the influence of other men, most of whom were intellectually his inferiors. One taught him, he says, to weigh his words and to be cautious in statements; another was supposed to open his mind to teach him to think and use his reason. From others he perceived the importance of certain doctrines and practices. If a friend were sympathetic and left him to himself, that also produced a developing effect. TROYON was no less modest and was always willing to ascribe his skill as derived from the suggestions of his friends, or if they were disposed to take the credit for his success, he raised no objection. He went so far as to believe that he acquired more from his pupils than he had taught them. To CAMILLE ROQUEPLAN he was held to be indebted for the principle that the *ensemble* of a picture must not be forgotten when working out details. THEODORE ROUSSEAU likewise operated on him. PAUL HÛET's description of TURNER's and CONSTABLE's experiments was also believed to aid in the growth of his genius. M. CHARROPIN has recorded that, if it were not for the incessant war he waged with him, TROYON would never have introduced cattle in his landscapes. If all the legends are true, there never was a painter who underwent so many transformations as CONSTANT TROYON.

The explanation is that TROYON was a great genius who was not endowed with self-confidence. He was a silent man, especially about the various theories which arose in his mind. He was able to realise many ways of expressing what he thought about nature, but how was one of them to gain preference? A far less gifted artist, with one or two very clear notions about what he ought to do, could easily arrive at a decision, and by continual repetition he would convince people that his limitation was a style. TROYON had, so to speak, the gift of tongues, and as he was never sure which was the most suitable on an occasion, he was glad to have the advice of his friends. There is a chapter in M. SALMON's "Souvenirs d'un Sculpteur" (which we lately reviewed) which gives a revelation of TROYON's peculiarities. At the time in question he was in the lowest spirits, as he well might be, for a dealer had refused to give him a hundred francs for a painting, and another would not accept one in exchange for a canvas. As TROYON had then passed his fortieth year, he concluded that he had been on a wrong path throughout his life, and his only chance was to begin again. He proposed to serve as a pupil with DUPRÉ if his friend would accept him. DUPRÉ humoured the hypochondriac. He ordered TROYON to prepare his palette, and it soon assumed the appearance of a circle of precious stones. DUPRÉ scraped off one brilliant spot after another until no more than the colours

* *Constant Troyon.* Par A. Hustin. Ouvrage accompagné de 42 gravures. Paris : G. Pierson et Cie.

of the spectrum, with some ivory black and bistre, were visible. DUPRÉ ordered him to paint with the revised palette, but if he had insisted on monochrome painting, TROYON would have complied. In the next exhibition the artist's new manner was supposed to be perfection; amateurs and dealers contested for his pictures, and TROYON's earlier works, which were scorned year after year, were accepted without misgiving. M. CHARLES BLANC gives another version of the origin of the sudden success of the artist. In 1849 LOUIS NAPOLEON, whose *coup d'état* was like MACBETH's in being "fantastic," visited the Salon. M. BLANC, who was deputed to attend him, took some trouble to point out the merits of TROYON's pictures, but without convincing the President. However, when the name of the artist a few days afterwards was returned among those which ought to figure on the roll of the Legion of Honour, LOUIS NAPOLEON good-humouredly concluded that his want of ability to appreciate TROYON's works must arise from some deficiency, and the ribbon was awarded to the artist. Whether the cause of the unexpected success was due to the operation of DUPRÉ's palette knife or to the praise expressed by CHARLES BLANC, the conclusion must be drawn that French dealers and amateurs are as whimsical as those of other lands, and that a painter's merits are as likely to be overlooked in Paris as in London.

If continuous labour merited reward, TROYON was entitled to it. Few of his contemporaries could present such a record of toil amidst neglect. He was born in 1810 at Sèvres, where his father and mother were employed in the royal pottery. The family was very poor, and in the course of a few years the mother was left a widow. Young TROYON grew up amidst works of art, and in his childhood he began the studies that were requisite to prepare him to take his father's place among the pottery decorators. He was a diligent student, but from the first he appears to have felt doubts about the claim of any style to be an adequate revelation of nature. The country around Sèvres is still beautiful, and in those days it was less of a Parisian suburb. In the mornings young TROYON endeavoured to represent bits of it, but he found he was hampered by his decorative studies. The legendary herald painter, who was enraged by the difference between his own lions and those he beheld for the first time in the Tower of London, satisfied himself by concluding that nature was in error. TROYON was less confident about the superiority of the flowers, trees and landscapes which he prepared to adorn pottery. He received some instructions from a landscapist, but he was no more able to reconcile the style that was then in favour with nature than his own decorative work. With all his doubts about the best way of rendering scenery, three of his views about Sèvres were accepted as suitable for the Salon of 1833.

TROYON painted a good many nooks and corners of the same district in succeeding years. Then he went further afield and became acquainted with landscape of a wilder sort. His pictures were duly hung, but when in 1841 he is found to have sent in a *Tobit and the Angel*, made up of conventional rocks, trees and streams, quite in the Italian style, it becomes evident that TROYON was nervous about putting on canvas what he saw, and that Academic rules kept him in thrall. Fortunately for him, he was welcomed among the artists who were in revolt against old world recipes, and who had made the forest of Fontainebleau a place of inspiration as well as a refuge. By 1844 his contributions to the Salon had become less artificial. But he was not entirely free from fear about the dangers of innovation. He could paint animals with at least as much power as was to be seen in his trees, and his friends wondered why he did not make a combination of the two elements. That was his own desire, but the respected lawgivers of art had laid down that a picture must lend itself to classification or catalogue making, and therefore should above all things have a definite determination or unity. Did not CLAUDE profess to paint only landscapes and to give away his figures as if they had no part in the pictures? Did not NICOLAS POUSSIN paint figure-pieces alone, for although he carried home pieces of rocks and trees and was most careful with his backgrounds, they could be no more than fortuitous landscapes? Why should a man who had a mother to support and other burthens, and who was not a favourite with the public, jeopardise himself by producing pictures of

so uncertain a character that some experts would call them landscapes while others would say they were "animaux"? TROYON was undecided, and to escape from apprehensions and temptations went to Holland, in order to discover if the Dutchmen, who loved animals as well as fields, had found any way of combining them without sacrifice of their qualities. He returned with the conviction that it was best to follow nature, and if he found himself delighted with country scenes to which additional animation was imparted by animals, why should not a record of it please other men?

The public were pleased by the innovation, and were indifferent to the difficulties which were imposed on the classifiers. The general belief was expressed by EDMOND ABOUT when he wrote:—"The most admirable of all our landscapists is a painter of animals. His manner is large, his ideas simple, a profound sentiment of nature animates all his works. His is a colour that we know, for we have seen it in the country." Fortune came to the artist with both hands full, as if to make compensation for long years of poverty. "I am told," said ABOUT, "that M. TROYON has in the course of the year sold pictures to the amount of a hundred thousand francs. Was it too large a sum to receive? Certainly not." It may appear nowadays that 4,000*l.* is too insignificant a sum to enable a man to be considered as a popular painter, but it must be remembered that ABOUT was writing of a time that is forty years back, and of Paris. For ten years TROYON's talent appeared to be growing. In 1859 two of his pictures, the *Departure for the Market* and the *Return to the Farm*, a morning scene and an evening, revealed his genius at its best. Afterwards there was a gradual decline in his handling, and towards the close of his life his vision seems to have become distorted, although he was unconscious of any change. He died in 1865.

TROYON appeared to have always before his mind's eye "les délices de la campagne." His pictures might be evidence that France was the loveliest and most fertile of pastoral countries. His trees are luxuriant, his cows and sheep well fed, his peasants happy. If compared with MILLET, he must be considered as over imaginative, if not an idealist. TROYON had to suffer in his best years from that hope deferred which maketh the heart sick, and we may even suppose that his disappointments strained his brain, but he avoided expressing his sorrow on canvas. His pictures suggest a man who could only see the sunny side of things, and was too happy to think about the misery that was visible near every field. TROYON possessed that joyousness of spirit, when in contact with nature out of doors, which is supposed to have been the especial prerogative of primitive times. His extraordinary skill in chiaroscuro never seems to have induced him to treat sombre subjects; he employed it mainly to increase the brilliancy of sunshine. Indeed, his natural gifts for the expression of phenomena were so strong, his best works do not seem to be laboured. TROYON judiciously kept within bounds where he could revel in nature as a faun.

It is not easy to write a biography of so quiet a man, who may be said to have had only one way of uttering his thoughts. TROYON was not talkative and he detested writing. He avoided adventures, and none arose in his journeys from his studio in Paris to his mother's house in Sèvres, or the district where he had decided to set up his easel. M. HUSTIN perceived that TROYON, even in his biography, should not be severed from painting, and he accordingly describes the artist at work, his processes and the results. A very elaborate account is given of the sales of TROYON's pictures and drawings, and there are faithful reproductions of the paintings or of masterly etchings from them.

EXCAVATIONS IN EGYPT.

DURING this winter two pieces of archaeological work are being carried on in Egypt under English direction. At Deir el Bahri, near Thebes, says a correspondent of the *Manchester Guardian*, M. Naville, on behalf of the Egypt Exploration Fund, is uncovering the great temple of Queen Hatshepsu; while at Coptos, thirty miles further north, excavations in which Manchester is specially interested have been begun by Professor Flinders Petrie. Coptos—or, as it is now written, Kofo—was from the earliest times a commercial city of great importance. Situated as it is at the end of the great

trade route across the Eastern desert to the quarries of Hamamat and to the Red Sea, it must have been the starting-point of all the many expeditions sent to bring great stones from Hamamat, and those which marched across to Kossair, there to make their ships for the voyage to Punt. It is mentioned in an inscription so early as the sixth dynasty. It is known to have contained a large foreign population and its prosperity lasted until the time of Diocletian, when it revolted and was besieged and destroyed. Of its later history little is known; Keneh became the terminus of the Red Sea trade. Now "the holy city of Kebtu" has become the Arab Koft, a miserable town ignored even by the postal steamer; in the modern town there is nothing of interest. The ruins lie to the south-east. Here, over a space half a mile in each direction, the ground is covered with crumbling walls of unbaked brick; some are thin, others 15 feet thick and 30 feet in height. Between them the ground is covered with a thick layer of broken pottery of late Roman date, which crackles continually under one's feet. This strange accumulation is due to the labours of the Sebakhin, who are rapidly denuding most ancient sites in the country. They take the soil from the ruins, which has been found to possess some value as a manure, pass it through a sieve and carry it away in sacks to scatter it over the soil. It is with the fragments of pottery thrown from the sieve that the whole area of the city is now covered. The rate at which the ancient ruins are being removed is very rapid. In Koft most of the Roman wall which surrounded the town has disappeared, and the whole level has been lowered 30 feet. So the process will go on until the ground is lowered to water level, when palms will be planted and cultivation will spread over the whole site and nothing will be left of Coptos but a few pieces of sculpture scattered among the museums of Europe.

But as yet there is something which has still the appearance of a town; the streets are cumbered with heaps of fallen bricks, and only the stoutest of the house walls are left, but the main lines of building are clear; the city wall can still be traced, and in the centre of the town the temple area forms a clear space on which private buildings have never been raised. It is in this temple area that work has been begun; no building is left above ground, and the temple for whose remnants search is made is known to have been a recent one. But there is always the hope of finding reworked stones—stones perhaps of the temple of the sixth or the eleventh dynasty, utilised by later builders in foundations or in pavements. This hope has already been brilliantly realised. Half of a stela has been found representing the wife and daughter of Rameses VI. Of this king, one of the sons of Rameses III., very little is known, and this monument is valuable as giving the name of his wife, "Gold and Lapis Lazuli." Another stela, removed at some unknown period from the cemetery and worked into the temple pavement, is of the eleventh dynasty, and, like the famous Antef stela, not only represents the deceased person and his wife, but their dog is seated under their chair, and its name is given. This prominence of dogs is characteristic of the eleventh dynasty, the great period of sport in Egypt. Professor Petrie suggests, with great probability, that this taste for hunting arose in the times of the princes of the ninth and tenth dynasties, who ruled, not over the whole country, but over little strips, perhaps twenty miles long, of the Nile Valley. The cares of government could not absorb their whole time, foreign war was impossible for them, and they would naturally turn their attention to antelope-hunting and the desert.

In the bed of clean sand on which the temple of Coptos was built Professor Petrie has just discovered parts of a primitive statue of the very greatest interest. They consist of the head and legs of an idol of Khem, the local god of Coptos, which must be attributed to a period long before the oldest art hitherto known in Egypt. The head is a rounded block, with roughly-hewn ears and a beard, but no face; the legs consist of a pillar 6 feet long, with the division between the legs indicated by a deep groove; the knees are shown roughly, but the feet are missing. The side of one leg is covered with sculptures in low relief, which are quite as nearly related to the rock carvings as to the tomb sculptures of the fourth dynasty. There is the unexplained symbol of Khem—the dish with a double barb at each side; there are two large seashells; there is a cow and a hyæna upon the mountains, and an elephant. This elephant alone shows that the sculptures are of a very early period; it is not known in Egypt in historic times, and only occurs in the hieroglyphs in the name of Assuan, Abu, afterwards Elephantine. No sign of its presence so far north as Coptos has been hitherto observed. This statue, we may safely conclude, was the primeval idol of Khem, perhaps originally a natural block with some rough resemblance to a man. Under one of the great kings, perhaps Khufu, it was doubtless replaced by a more satisfactory work of art, and lay in the temple area neglected until the builders of some later temple buried it in the sand bed in which it has now been found. The whole statue must have stood 15 feet high, and must have needed some prop to sustain it. This will explain the band shown in all the representations of Khem, attached to his head and

falling to the ground behind. The black face characteristic of the god may also be explained if we suppose that this idol had an ebony face attached to the flat stone surface now seen. The body of the statue will probably be found as more of the sand is cleared. Then we may restore in its completeness the oldest work of art in Egypt, an idol that was of unknown, untold age when Sueseru died and the new King Khufu began to build the Great Pyramid.

SURVEYORS' INSTITUTION.

THE following candidates who presented themselves at the preliminary examination of the Surveyors' Institution, held concurrently in London and Manchester on the 24th and 25th ult., have satisfied the examiners:—Adams, Ernest Victor; Addiscott, Henry Hugh; Arno, Samuel; Baines, John Cecil; Banks, Herbert Richard; Bickford, Joseph Grant; Bradwell, Gervase Hulbert; Chadwick, Spencer Dyson; Colbourne, Robert Bertram; Cox, Walter Theodore; Daniel, Henry Wilkinson; Drew, Walter Hubert; Driffeld, Thomas Henry; Ellis, Louis Boissevain; Fair, Arthur Edward; Funnell, Horace Frederick; Gale, Arthur Witherby; Goadby, Howard; Hickman, Arthur Murhall; Holden, Orton; Hyam, Lionel Alfred; Hyam, William Percy; Jackson, Frederic Arthur; John, Henry Bell; Jones, Leonard Reginald; Kaye, Herbert; Kerr, John Murray; Kibblewhite, Henry James Treleven; Kingsford, Percy Hamilton; Lake, Cuthbert Joseph; Lakin-Smith, Ernest; Lee, Ernest Edward Arthur; Lee, Henry; Mallinson, Charles Herbert; Martin, Herbert; Matthews, Robert St. John; Mitcheson, Harry; Molyneux, Frank Eustace; Mortimer, Claude Alick; Oliveri, Felix; Osborn, George; Prior, Henry; Richardson, James; Rickards, Robert Hillier Traherne Anson; Sanders, Cyril Sturgis; Scoble, Herbert Thomas; Simmons, James Edward; Sly, William; Smith, Charles Gordon; Stokes, Hugh Charles; Straker, Howard; Thompson, Claude William George Hugh; Toller, Henry James (passed at head of list); Town, Henry Anandale; Towse, John Stanley; Tregelles, John Allen, jun.; Turner, George John; Walton, Edgar Thomas; Wheatley, Stephen Gladstone; White, Henry Ernest; White, Walter Ernest Coates; Wigram, Henry Joseph; Wilkinson, Frank; Wilkinson, Percy Newton; Wood, John Edward; Wooldridge, Henry Walter; Young, William.

JAPANESE BUILDING.

A MEETING of the Japan Society was held last week, when Mr. F. T. Piggott, vice-chairman of the Council, read a paper entitled a "Note on the Form of Japanese Temple Roofs." He remarked that the curves in the roofs of Japanese temples were about the most difficult things a man could draw. How the Japanese builder succeeded in erecting the roofs passed his comprehension. All the temple roofs, however, were evidently derived from tents, and this led to the interesting question whether the Japanese ever lived in tents. With regard to the "Key Pattern" in Japan, which formed the second subject of Mr. Piggott's address, he remarked that there was no doubt that symbolism played a large part in its formation. There was a remarkable affinity between the development of the Greek key pattern and the Japanese. In the discussion which followed it was pointed out that there was a distinct tendency to avoid the arch in the designs of Japanese builders, although they would pile beams upon beams. One speaker observed that it was a pretty and sentimental idea that the places of worship were first tents or small tabernacles, and gradually, in the same shape, assumed the character of large and permanent temples.

TESSERÆ.

Perpendicular Mouldings.

IN the mouldings of this style a debasing influence will at once be perceived in the comparatively meagre save-trouble method of working them. Large and coarse members, with little of minute and delicate detail, wide and shallow hollows occupying spaces which, in early work, would have been filled with groups of separate mouldings; hard wiry edges in place of rounded and softened forms, and general shallowness of cutting, are all conspicuous characteristics. Add to these that their general arrangement on the chamfer plane, which is a marked feature of the Perpendicular period, gives a flatness which is displeasing to the eye in comparison with the rectangularly recessed grouping of the two preceding styles. At the same time, there is such a mass of really high art in the work of this period that the student must be careful not to slur it over in indulging any predilection he may have formed for earlier work. The mouldings of this style frequently die into a basement composed of the simple uncut chamfer plane, in which case the outer edges of each moulding, of course, coin-

cide with it, since it is only by cutting channels that the mouldings are developed from it. Three peculiarities are so common in Perpendicular mouldings that their absence almost forms the exception to general usage. These are:—(1) A wide shallow casement or hollow, usually occupying the centre of the group, and equal to about one-third of the width; (2) the constant use of bowtells, or beads of three-quarters of a circle, resembling small shafts and often used as such; (3) the frequency of the double ogee and some varieties of it peculiar to the period. The casement alluded to may undoubtedly be regarded as an elongation or extension of the decorated three-quarter hollow, by which width is gained at the sacrifice of depth. Accordingly, it is generally a mark of Early Perpendicular work when the casement is deep and narrow, of late when wide and shallow, and of debased when it is, as it were, so stretched as to become almost or quite a flat surface, sunken just a little below the chamfer plane or external line of the group.

The Study of Old Masters.

An obstacle to the advantage to be derived from the works of the old masters arises from the belief that all has been done that can be done. We are prone to consider the art as an enclosure in which we can only travel in a circle, rather than as a vantage ground from which fresh discoveries in nature may be made. It is easy to add capricious and eccentric novelties of style to what exists; but to present some genuine quality of nature for the first time, or some new combination of what is already known to art, is the great difficulty, and yet it might be oftener and more easily accomplished than it is, if we would allow the art to lead us to nature, rather than erect it into a barrier against all in nature that is not already admitted within its confines. He who believes that nature is not exhausted will, if he truly loves her, find that she is not. It is this faith in her abundance that has caused every revival of art from its slumbers. It was this faith that inspired Rubens and Rembrandt to restore the glories of the Flemish and Dutch schools; not by attempting their exact revival, but by opening new views of nature and creating each a style of his own, which, in spite of many and great faults, has placed them for ever among the most illustrious benefactors of painting. It was the same faith that inspired Hogarth, notwithstanding the most discouraging circumstances that ever genius was surrounded by, to create a species of art unknown to the world before him, and to carry it at once to a perfection precluding all imitation; and it was the same faith in the boundless stores of nature that enabled Reynolds to give a fresh charm to portrait after all that had been done for it by Holbein, Raphael, Titian, Rubens, Vandyke, Velasquez and Rembrandt. It is easy to delude ourselves into the belief that we love art or that we love nature, but the genuine love of both ought certainly to produce such effects as have been noticed, for the great painters mentioned have all achieved their separate triumphs by that unerring instinct of genius which looks to art only as the interpreter of nature, and not as a thing in itself perfect and completed.

Broken Colouring.

In passing through the streets our eyes are attracted by the splendid tints of the coloured liquids in the shop windows of the apothecaries. To a careless observer each bottle seems to contain one colour only, and that the most brilliant of its kind; but, on examination, we find that every mass of colour is made up of a great variety of tints caused by reflection and refraction, and that these are perpetually changing with the change of passing objects; now, in these varieties lies the secret of the delight given to the eye. What is true of these bottles is true of every object, in a greater or less degree, as it is capable of receiving reflections and refractions, the appearance of all things being in some sort modified by surrounding objects. Reynolds occasionally made up tableaux of his most important compositions. When he painted his *Dido on the Funeral Pile*, he put together billets of wood, covered them in part with the rich objects he has introduced into the picture, and placed his model on it, in the attitude and dress of the expiring queen. This arose from no want of imagination, nor with the intention of imitating all the minute details of the objects he thus puts together; but because he knew that a degree of general truth and harmony of light and shade and colour could thus be best obtained, and accidental beauties of combination would, by this means, be suggested which might not otherwise occur to him. In his "Discourses" he remarks on a similar practice by Gainsborough; and should such practices appear to consume time unnecessarily, it can be replied that far more time is often lost in endeavouring to guess at effects, which such contrivances show us at once. Wilkie, in his earlier practice, often made small models of the rooms that formed the scenes of his pictures, with the proper doors and windows, and placed the general forms of his groups and furniture within them, and he had no reason afterwards to regret this as any waste of time, for it contributed to the excellence of his art. When these principles are understood it will be seen at once how it is that nature, though some of her combinations are more beautiful

than others, at no time offends us by those discords we find in badly-coloured pictures; and that we are never reminded by her hues of red, blue or yellow paint. It has always been felt that harmony is the result of breaking of positive colour, and those who have not carefully examined how, and why, and in what degree nature breaks her colours have no other resource left to avoid harshness than to *dull* every tint. They do not observe that, while in some places nature breaks and subdues colour by reflections, in others she doubles and often more than doubles their brilliancy both by reflections and refractions. It becomes, therefore, of great consequence to imitate the appearance of every object with reference to those that surround it. Yet how contrary is, and always has been, the practice of most painters—for they perpetually copy living models in their studios to which landscape backgrounds are added. Queen Elizabeth has been much misunderstood in the saying attributed to her that she would be "painted without shadow." If she even used the expression, she meant, what she said at another time, that she would be painted in "*an open garden light*"—for she saw that there was a great difference between such effect and the effects in pictures. But as the painters of her time could not paint objects as seen in the open air, they painted her literally without shadow. There are portraits by Gainsborough that would perhaps have satisfied her, for some of them really appear as if painted out of doors, and on some of the small figures of De Hooze the effects of open daylight are shown in perfection.

The Supreme Period of Greek Art.

In no other place or time on our globe have so many distinguished and highly-trained intelligences existed within so short a period as Athens can exhibit during the interval between 480 and 380 A.C. Statesmen, generals, orators, historians, such as Herodotus, Thucydides and Xenophon; philosophers like Anaxagoras, Plato, Socrates; dramatists, like Sophocles, Euripides and Aristophanes; artists, such as Ictinus, Mnesicles, Phidias, Polygnotus, Alcamenes and Myron were chief jewels in this precious crown. Among such spirits as these, of whom most, as contemporaries, were in personal contact with each other, how vivid must have been the reciprocal action, both in urging each individual onward and in raising the general tone of all. To what heights of multifarious intellectual cultivation must the human species in Athens have been elevated during that period. Let us now especially contemplate for a moment the position of the architect and of the plastic artist in that age, so auspicious to the ascent of the highest point ever yet reached by human capacities. The kindness of nature had bestowed in abundance the noblest materials in the marbles of Pentelicus and Paros. Mining and commerce brought them brass, gold and ivory. For models of the nude figure, the palaestra afforded incomparable studies in the most beautifully-trained bodies of all ages, from early youth to robust manhood, in varied and voluble motion. For draped figures, in every street, in every square, at rest and in every kind of movement, the richest store of subjects offered themselves to the artist in beautiful picturesque costume. His general mental education was admirably furthered by intercourse with men such as Sophocles and others of those already named. Finally, his moral self-respect could not fail to be infinitely raised in tone by the consciousness that the Hellenes bowed in reverence before the images of gods which he had fashioned; that it was he who bestowed on man the highest of known honours by the production of the iconic statue. A kindred feeling must in like manner have possessed the dramatists when the noblest and richest men of Athens contested the honour of rehearsing the choruses of their plays, and of displaying them at enormous cost, with splendid costumes, while the most select of the highly-cultivated Greeks listened in rapture at the words which they had put into the mouths of their gods, heroes and choruses. Here, too, during this most flourishing epoch, poetry still moves in advance of the plastic art, and both again mutually reflect each other in their chief productions. The sublime *Æschylus* has his counterpart in Phidias, the sculptor of the lofty Zeus—by whose image, as the ancients expressed it, he added a certain new dignity to religion—an image which it was counted by any of the Hellenes a misfortune not to have seen once in their lives; the sculptor, too, of the grave and pensive Pallas—and after Phidias, in Polycletus, the sculptor of the proud and majestic Juno. To the graceful and pathetic Sophocles corresponds Scopas, the sculptor of Niobe, and of the Venus of Milos, the noblest conception of that goddess. The passionate, touching and more sensual Euripides is reflected by the elegant and voluptuous Praxiteles, the sculptor of Venus as the ideal of amorous enchantment, as also of the Eros. But now, when with Lysippus, in his representation of Alexander, the plastic art of the Hellenes gradually descended from gods and heroes to the most consummate exhibition of merely human forms, it kept its place, under Alexander's successors, even while in the service of domineering Rome, until the days of Hadrian, although in a slow decline, yet still at a considerable pitch of

excellence, and thus flourished, we may say, throughout a period of six centuries. This long continuance is chiefly attributable to the delicate tact of the Greeks, which taught them to avoid deviating essentially from any ideal which had once been embodied to perfection, without falling the while into merely servile and spiritless copying. The most ingenious artists, indeed, well know how to make their own individuality sufficiently prominent by an infinite variety of delicate modifications, while strictly adhering to the general character of their standard. In this very circumstance lies one of the most engaging attractions of Hellenic art to its admirers. Hereby, at all events, the universal eagerness for works of plastic art in those ages of Greek antiquity could be qualified in a manner at once becoming and complete—so that all the masterpieces of sculpture, on every scale, from the Colossus down to the smallest coin, and in every material, from gold and silver to baked clay and wood, as well as the finest works and designs of the great painters, were preserved in innumerable repetitions, from the decoration of earthenware vases to the fugitive wall-paintings of the humblest dwellings, even in such a petty town as Pompeii. To this last-named circumstance we owe the preservation to our days of so vast a treasure of the genuine inventions of Greek art.

Novelty in Gardening.

As writers and readers multiply in a language, every plain and easy mode of expression which it affords becomes trite and common by frequent repetition; and certain degrees of vicious refinement and affectation become absolutely necessary to exalt the style above the familiar vulgarity of common colloquial speech; and as this common colloquial speech is constantly extending its usurpations and vulgarising refinement, refinement can only maintain its character and keep out of its reach by constantly retreating from it, and becoming more refined and consequently more affected and constrained; this will be found to be the progress of all highly polished languages. In no art has the passion for novelty had more influence than in that of landscape gardening, or embellishing and improving grounds, of which it appears hitherto to have been almost the sole principle. Whenever this art has been practised in countries only partially and imperfectly cultivated, as in the ancient Persian and Roman empires, and in the modern kingdoms and states of Europe till lately, it always appeared to delight in a profuse display of labour and expense, and in deviating as much as possible from ordinary nature. Rivers, springs, groves, lawns and forests were to be seen everywhere, and the country was covered with fine trees, which exhibited every variety of natural form; but canals, fountains, quincunxes and parterres were only to be seen where art and industry had formed them, and trees cut into the shapes of pyramids and colonnades, men and animals, were new and unusual objects, and such as were only to be found in highly dressed gardens. Novelty, contrast and surprise are naturally so pleasing that every person was delighted with objects of this kind; and as the word beauty is always applied indiscriminately to every visible object that is in any way pleasing, no one hesitated in calling them beautiful. A great writer, Montesquieu, has, indeed, gone still further, and so completely sacrificed both his feelings and his philosophy to the fashion of the day that, in investigating the subject he discovers that surprise, arising from novelty and contrast, is the genuine principle of beauty; and that consequently the Boromean island, in which all these tricks of art are contrasted with wild uncultivated mountains surrounding an extensive lake, is the most beautiful spot on the globe. Another great writer (Burke) afterwards discovered that surprise or astonishment was the genuine principle, not of the beautiful, but of the sublime, which, according to him, is as diametrically opposite to beauty as pain is to pleasure. When Montesquieu and Burke thus differ upon a subject of common sense and feeling, which each had made the particular object of his investigation, who shall hope to escape error in any theoretical inquiry?

Michel Angelo and Ancient Sculpture.

The great artists of antiquity, though they exalt the characters of their gods and heroes above those of ordinary nature, yet, when exhibited in action, they put their limbs and bodies into such postures as such actions would spontaneously produce in common life. Jupiter wields his thunderbolt, Neptune his trident, and Minerva her spear, exactly as we should; but in the figures of Michel Angelo, all is directly reversed. The characters, though remote from ordinary or individual nature, are oftener below than above it in dignity of expression; but then their attitude and gestures are such as ordinary nature never does display under any circumstances, except such as influence it in a painter's or sculptor's study or academy. Even in representing sleep he could not employ a natural or easy posture, but has put Adam into one in which all the narcotic powers of opium could scarcely have enabled him to rest. It was not, however, to conceal any want of industry or science that

Michel Angelo ran into this error, but from an eager and injudicious desire to display knowledge where he should have consulted feeling and expressed sentiment. Though not to be compared even with a third-rate artist of ancient Greece in knowledge of the structure and pathology of the human body, he appears to have known more than any of his contemporaries, and when he made his knowledge subservient to his art, and not his art to his knowledge, he produced some compositions of real excellence. Such are almost all those which he designed for others to execute; such as the *Raising of Lazarus*, the *Descent from the Cross* and the *Entombing of Christ*, in which he lowered the tone of his invention to meet the capacities of the colourists, Sebastian del Piombo and Daniel di Volterra, and thus, through mere condescension, became natural, easy and truly sublime. Where he puts forth all his might, and sacrifices just expression to what is called grandeur of form and outline, he seems to counteract his own ends; for form, considered in the abstract, is neither grand nor mean, but owes all its power of exciting sentiments either of the one kind or the other to the association of ideas. We have learned by habitual observation that certain forms of the limbs and body are adapted to great exertions, and certain forms of the features to great expression, or the expression of great character and lofty sentiment; whence such forms excite grand and elevated ideas of the objects in which they appear. In the abstract forms themselves there is, however, no more of grandeur than there is in so many mathematical lines of similar figure and dimension, for though we extend our ideas of grandeur of character to the forms of inanimate objects, it is still upon the principle of association and sympathy.

Ancient Greek Vases.

It was in the last century that excavations in the cemeteries of Etruria brought first to light large numbers of ancient vases painted with scenes from the mythology and the daily life of Greece. At first they were called Etruscan vases, in spite of the fact that not only their art and their subject, but also their inscriptions, were purely Greek. It is only in late years that the fact has been discovered that they were importations from Greek factories, coming in the earlier period from Corinth or Chalcis, and after a time principally from Athens. We may congratulate ourselves on the fortunate circumstance that the wealthy Lucumones of Etruria thought it in good taste to adorn their houses and to fill their graves with the delightful vessels. Our gain is inestimable. It is true that Greek vases have a language of their own, and probably even well-informed and artistic visitors pass through the vase-rooms of our museums without feeling much interest in their contents. But the language is well worth learning. There is no class of ancient monuments which has risen so rapidly of late years in the estimation of archæologists. The students who take the pains to understand Greek vases soon discover not only that their art is, within the limits which it studiously observes, most admirable, but also that they carry with them more of the flavour of ancient life than even sculpture or coins. They not only give us abundant information as to the beliefs, the cults and the customs of Greece, but they put us at once, if only they have escaped restoration in modern Italian workshops, on terms of friendship with the potter who moulded and the painter who decorated them. Clay, with its marvellous durability, preserves for us not only the ultimate design of the worker, but his first sketch, his second thoughts, his mistakes and carelessness, his happy inspirations, and the obstacles which interfered with their realisation. A vase bears the same relation to a sculptured relief which a diary bears to a formal historical treatise. It is more local, temporary and personal, and at the same time vases are among our most serious documents in matters of mythology and mythography. Every year they are used more and more for comparison with the plots of the tragedies of Æschylus and Euripides and the lyric tales of Pindar. Writers now apply the test of vases, as they are perfectly justified in doing, in order to determine the comparative antiquity of various versions of Attic myths and their popularity among the people. How far brighter and fresher is this source of knowledge than the musty, pedantic pages of an Apollodorus or a Hyginus.

Bacon and Gray's Inn Gardens.

In the 40 Eliz., at a pension of the Bench, "the summe of 7*l.* 1*s.* 4*d.* laid out for planting elm trees" in these gardens was allowed to Mr. Bacon (afterwards Lord Verulam and Lord Chancellor). On November 14, in the following year, there was an order made for a supply of more young elms; and it was ordered "that a new rayle and quickset hedges" should be set upon the upper long walk, at the discretion of Mr. Bacon and Mr. Wilbraham; the cost of which, as appeared by Bacon's account, allowed April 20, 42 Eliz., was 6*o*l. 6*s.* 8*d.* Mr. Bacon erected a summer-house on a small mount on the terrace, in which, if the conjecture may be allowed, it is probable he frequently mused upon the subjects of those great works which have rendered his name immortal.

NOTES AND COMMENTS.

THE designs sent in for the new municipal buildings in New York present offices which would cost a far larger sum of money than was contemplated. The newspapers in consequence are almost unanimous in condemning the action of the architects who have aided the Commission as an advisory committee. The Architectural League of New York have held a meeting to express confidence in that committee, when the following theory of the principle of competition designs was enunciated:—"Competition drawings can under no circumstances be more than elaborate sketches; the object of a competition is fully accomplished if a plan is selected which in its general features of design, both in ground plans and elevations, conforms with the instructions given and offers a project which, with careful study and without any radical departure from the original scheme of the design, may result in the construction of a thoroughly satisfactory building." As several designs in a competition are always likely to bear that sort of approximation to the contemplated satisfactory building, opportunities would be given by the adoption of the theory for the exercise of that sort of diplomacy which is familiar in America.

IN the annual report of the Institute of Fine Arts, Glasgow, it is again announced that the Council have resolved to hold in the galleries during next summer and autumn an exhibition to illustrate the history and progress of Glasgow from the earliest times until the middle of this century. An influential committee, composed partly of members of Council and partly of outside experts interested in the history and archaeology of Glasgow, will organise the exhibition. The Council appeal to all members who have Glasgow relics in their possession to lend their treasures to the Institute, and so aid in its success. The exhibition will be one that will appeal strongly to all who take an interest in the story of the development of the city. The Council have been informed that the late Mr. D. E. OUTRAM, once chairman, had bequeathed 5,000*l.* to the Institute. The membership is 717, of whom five are lady members and ninety-one artists. After many years of struggle the position of the Institute is becoming every year more assured, and its importance in the world of art more and more recognised. Art in Britain owes much to the Institute. It rests with the members and the general public to do their utmost to further its material prosperity, and so aid in increasing its working power and extending the sphere of its influence.

ABOUT a league from Metz will be found the remains of the aqueduct which at one time was supposed to have been constructed by the Roman legions in the time of DRUSUS, whose monument is at Mayence. Of late the work is supposed to date from the time of CONSTANTINE THE GREAT. The aqueduct was employed for the water supply of Metz (Divodurum). The part that has survived is in the valley at Jouy, but it is not one continuous part. Near the village are six arches, and at a distance are ten others. The spans are not uniform. The material employed was stone, which was cut to the size of the ordinary Roman bricks. The piers are rather flat, and vary in width. The aqueduct was carried over the Moselle, but that portion has been removed. While the French possessed Lorraine the aqueduct received less attention than it deserved; from its simplicity it was undervalued. The Germans have, however, resolved to preserve so important a memorial of the Roman invasion, and, under the direction of Herr TORNOW, a careful restoration has been in progress during the past two years. The safety of the aqueduct is therefore secured.

A MEETING of the Jewish Historical Society was held on Sunday, when the Chief Rabbi read a paper on MANASSEH BEN ISRAEL, the learned Portuguese Jew of Amsterdam, who conferred with CROMWELL about the return of his people to England, and if he failed with the officials, was rewarded with a pension of 100*l.* a year, payable quarterly. When a mere boy MANASSEH attracted crowds to hear him preach. He wrote in ten languages, was versed in theology, classics and medicine, and printed his own books. He established the first Hebrew printing-press in Amster-

dam. One of his most intimate friends was REMBRANDT, who took up his residence near the Jewish quarter, so that he might make a study of Oriental types of countenance. In 1636 REMBRANDT etched a portrait of his friend, which disclosed the kindness and intelligence of the Jewish divine, and fully corresponded to a description of him given by THOMAS POCKOCK. In 1655 REMBRANDT sketched four small etchings to illustrate one of MANASSEH's theological works. The paper suggests that if some enthusiastic Jew would investigate the traditions which may have survived among his people in Amsterdam, the darkness which surrounds REMBRANDT's relations with their ancestors might be removed.

So many town councils and local authorities have discovered that, owing to the competition between architects it is not risky to act illiberally towards one of the profession, we need not wonder if in Rochdale it is sought to play a similar game with painters. It is so rare to have the chance, perhaps the Rochdale Council will be envied by other bodies. In the Town Hall was a painting of the *Signing of Magna Charta*, which was damaged by the fire which occurred some years ago. A claim for 360*l.* was sent in to the insurance company on account of the picture; but all that was paid was 339*l.* 10*s.* Mr. HENRY HOLIDAY was asked to repaint the work, and he agreed to do it for 210*l.*, which left a substantial profit to the Corporation. The artist, however, introduced additional figures, for which he asked to be paid 50*l.* as an extra; the Council gave him one-half that sum. Mr. HOLIDAY, we suppose, was not satisfied with his treatment, and claimed 38*l.*, thus making the extra work amount to 63*l.* By a large majority the Council decided to pay no more money. It is not denied that the commission has been creditably executed, but we suppose the Council wish to have the satisfaction of gaining at least 100*l.* by their arrangement. As the General Purposes Committee have sanctioned Mr. HOLIDAY's claim, the action of the Council becomes more shabby.

It would be a novelty to hear a learned judge speak in praise of the Courts of Justice in the Strand. The fall of a fragment of Mr. Justice LAWRENCE's Court one day last week enabled his lordship to indulge in the prophecy that some day the whole building would tumble down. Mr. J. M. KNIGHT, who was giving evidence at the time, expressed confidence that he was not to be overcome by falling masonry, and declined to leave the witness-box. While the Strand building has no friends, the new Birmingham Courts appear to the judicial mind to be a model of convenience. This was shown by the advice offered to the Cardiff Town Council. New courts will shortly be undertaken in that town, and as soon as the project was mentioned to Mr. Justice HENN COLLINS, his lordship offered various suggestions. Mr. Justice WILLS recommended that the architect who was selected for the work should study the Birmingham Courts, which his lordship as well as other judges regarded as the best in the country. The safest course to adopt would be for the Cardiff Corporation to give the commission to Mr. ASTON WEBB.

A MEETING has been held by the North-East London Property Owners' Association, at which it was resolved "That this Association looks with dismay at the proposed Bill 'To consolidate and amend the enactments relating to Streets and Buildings in London,' introduced by the London County Council, and considers some of its provisions unreasonable and confiscatory." Wholesale condemnation of that sort cannot have much weight with Parliament. If the Association condescended to give some indication of the provisions that are so obnoxious, it would show a better knowledge of tactics. The Bill deserves to be carefully considered by every inhabitant of London. As copies are expensive, a handy abstract has been prepared by Mr. H. C. JONES, clerk to the Board of Works for the St. Giles's District, with the aid of Mr. GEORGE WALLACE, surveyor to that authority. It is better adapted for general use than the Bill, for it gives the sense of the clauses in a more pithy form. Moreover, it shows the relation of the Bill to the existing Acts and the extent of the new legislation which is sought by the County Council.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

The following gentlemen were elected members, viz. Messrs. C. H. Havers and J. H. K. Loas.

Mr. Fellowes Prynn was nominated to fill a vacancy on the committee, caused by the resignation of Mr. H. O. Cresswell, the election to take place at the next ordinary meeting.

Party Walls and Party Structures.

Mr. WOODTHORPE said:—It is with considerable diffidence I approach this subject to-night, one so full of interest to many of us, and one that contains so many points and questions upon which there seems to be very considerable difference of opinion among architects, surveyors, and lawyers (including even judges). The subject is such a very wide one that I have found it absolutely impossible to give in this paper anything like a full account of the many cases that are well worthy of consideration and likely to arise. My chief reason for choosing this subject was, that I thought it would be one likely to raise a good discussion; and it is most essential on questions of this kind to have as many different opinions as possible. It is also necessary for every architect practising in London to know something about this question and the necessary procedure thereon. Remembering that the majority of my listeners are probably either engaged in practice in London or likely to be so engaged in the future, I have treated the question mainly from a London point of view, and propose to divide the paper under five heads, as follows:—

1. The ancient statutes made from time to time, now repealed.

2. What is a party wall? (Illustrated by cases.)

3. The statutes and enactments now in force regulating party structures in London, mainly those that treat of the rights of building and adjoining owners, at the same time giving notes of some of the many superior court decisions which affect the subject.

4. The usual procedure.

5. The Bill to consolidate and amend the enactments relating to streets and buildings in London to be introduced by the London County Council as a private Bill in this next session of Parliament, so far as it affects the rights of building and adjoining owners.

I. Some of the Ancient Statutes.

I think it might be interesting to some of you to hear a few of the earliest enactments that affected this question, so, by way of introduction, I propose to take you back to the first record that I have been able to trace of any enactment concerning party walls:—

In the year 1189, in the time of Henry FitzAlwyn, the first mayor of the city:—"One great thing done in the time of this first mayor was about settling laws and orders for buildings in the City. And there still remains in the books of the chamber the order how to proceed in the assize concerning buildings between neighbours. It was provided and ordained by the discreeter men of the City, to appease contentions which might arise among neighbours in the City, upon inclosure between land and land; that twelve men, aldermen of the City, should be chosen in full hustenge, and there sworn that they would faithfully perform it, and come at the mayor's summons, unless hindered by some reasonable cause, and to be present with the mayor for executing the foresaid business. By these sworn men, orders were taken about party walls and about building them 16 'foot,' at least, in height and 3 'foot' in breadth, and to build them of stone for security against fire; and, concerning gutters, to receive and convey the water from their houses—all to be at common cost. Also concerning digging pits for water; concerning making windows 'upon' the neighbours; concerning putting corbels, *i.e.* girders or beams, into the neighbour's wall," &c. Note the curious meaning here of corbels, and also the expression "windows upon neighbours," meaning, I take it, ancient lights. It does not seem that this enactment, as to having party walls of stone 3 "foot" in breadth and 16 "foot" high for security against fire, was very strictly enforced, otherwise we should not hear of the divisions of timber that existed before the Fire of London.

The next records I can find of enactments concerning buildings were in the reign of Elizabeth, and contained in a strict proclamation to prevent overcrowding of buildings, and to abate the "embattling" of houses, yet to small effect; but there is no mention of any party division walls, though there were commissions granted "for the suppressing of hedges, ditches, and other such enclosures, to the hindrance of artillery, though the owners of the land were tenants in fee simple." There was also a proclamation in the second year of James I., in 1605, forbidding all increase of new buildings within the City and one mile thereof, and likewise commanding all persons henceforward to build their forefronts and windows either of brick or stone, as well for decency as by reason all great and well-grown woods were much spent and wasted (as timber for shipping waxed scarce). But this also had little effect. From this time began the new reformation of building, although it does not appear to have had much effect in preventing the spread of fire, and it seems apparent that any enactments that were in force to divide neighbouring buildings by walls had been allowed, by not being enforced, to lapse, as I can trace nothing else on the subject until after the Fire of London, though there was another Act in the year 1656 against overcrowding buildings outside the City, part of which I quote.

In the year 1656 an Act was made for the preventing of the multiplicity of buildings in and about the suburbs within ten miles thereof. The preamble sets forth how these new buildings, outhouses and cottages were found to be mischievous and inconvenient and a great annoyance and nuisance. This enacted that for every dwelling-house, outhouse, &c., erected at any place within ten miles of the wall of the City and not having four acres of land at least there should be paid one year's rent at the full and improved rack'd rent. And all that should after this build any house or cottage within ten miles should forfeit the entire sum of 100*l.* and 20*l.* per month so long as such house should be continued. After the fire in 1666 there was a long Act of Parliament for rebuilding the City; to carry out the enactments the Lord Mayor and Court of Aldermen nominated and appointed discreet and intelligent persons in the art of building to be surveyors or supervisors, to whom an oath was administered for the true and impartial execution of their office. This Act set forth that: "There shall be party walls and party piers set out equally, on either builder's ground, to be built upon by the first beginner of such building, and that no man be permitted to build on the said party wall, or on his own continuous ground, until he hath fully reimbursed the said first builder the full moiety of the charges of the said party wall and piers, together with interest at 6 per cent., to be accounted from the beginning of the said first building." The party walls by this Act were made thicker than the external walls. This Act also provided "That the surveyors shall take care for the equal setting out of all party walls and piers, and no person be permitted to build until that be done, and the builder was required to pay to the Chamber of London 6*s.* 8*d.* before the foundation was laid." At the same time the Common Council made regulations against fire. Some of these are very quaint. I will read one:—"That every alderman who hath passed the office of Shrievalty provide twenty-four buckets and one hand squirt of brass, and those who have not been sheriffs twelve buckets and a hand squirt, to be kept in their respective dwellings; and every other person being a subsidy man to keep in their houses a certain number of buckets according to their quality, and every man in case of alarm of fire had to turn out to his door with a bucket full of water ready to hand.

The next Act dealing with party walls was in the sixth year of Queen Anne, and made the regulations more stringent; and in the following year, the seventh of Queen Anne, a further Act was passed enacting that "the party walls were to be wholly of brick or stone, except door-cases, windows, lintels," &c., and be built "9 inches on each man's ground," and giving the first builder power to pull down the old wall, whether it was of brick, stone, or timber, and build a new wall, the owner of the next house paying for same at the rate of 5*l.* per rod. Next we come to the Act of the eleventh year of George I., in which it is provided that "if any person refuse or neglect to build his share of a party wall after due notice given him, his next neighbour may build it for him and oblige the person so neglecting it to pay the charges of rebuilding."

A three months' notice is required by this Act when the parties cannot or will not agree, and each party, after notice, was required to appoint two workmen (instead of, as now, one surveyor), to say whether the wall was a sufficient or sound wall; but it was sometimes found difficult to get the workmen to agree, and so in a further Act in the thirty-third year of George II. provision was made for a fifth "able workman" to be called in. However, this method was not found to work well.

A further Act was passed in the sixth year of George III., which enacted "that any person who shall build next adjoining thereto and make use of the party wall thereof, shall pay to the person or persons who hath the property in such wall

one-half of the value of such wall or of so much thereof as such person shall make use of, to be estimated and determined by two indifferent persons."

I might remark here that it seems to me a matter of regret that this provision has not been handed down to us and included in the present Act.

A further Act was passed in the twelfth year of George III. to consolidate the previous Acts as to party walls. It enacted that they should be still built half on each owner's soil, but their thickness was to be "according to the cost of the houses." This seems rather a curious regulation. The next Act was in the fourteenth year of George III. and repealed the last Act. In this Act buildings were divided into seven classes, and iron doors were first required to openings in party walls. This Act was repealed in 1844.

Now we come to the 1844 Act, the last one no longer in force. I cannot help thinking there are several enactments of this Act that had been better inserted in the 1855 Act; for instance, in section xxviii. (that dealt with damage arising from the erection of an external wall against a party wall), the building owner had certain rights to excavate the ground against the party wall, but only on condition that he underpinned the party wall; and in section xxxi. the building owner had a right to raise the party and the external walls and chimneys; but if at any time the adjoining owner wished to make use of any portion of the part so raised, it was lawful for the owner of the premises so first raised to recover the cost of a proportionate part of the portion so used together with such parts of the chimney-stacks. This seems a very fair and necessary regulation, and was contained in many of the old enactments, but for some reason or other omitted from the present Act. This Act of 1844 assigned to the official referees and district surveyors the parts now taken by the one, two or three surveyors.

In certain cases it also allowed "reasonable compensation" for any loss which the adjoining owner suffered by reason of the work of the building owner. It also gave a right to the adjoining owner of land abutting on other premises for further protecting his interest, where the building owner opened windows abutting on the adjoining owner's ground; to serve notice on the building owner calling on him to stop up these windows; if the building owner failed to comply, then the adjoining owner had the right to brick them up himself, and recover the costs of same. I have always understood from architects who practised under this Act that except in some few instances it worked fairly well, and the official referees formed an excellent tribunal, which I hope some day to see restored in the form of a special court. It has been inserted in the proposed Bill.

2. What is a Party Wall?

The definition of party wall given in the Metropolitan Buildings Act, as you all know, is as follows:—

"Party wall" shall apply to every wall used, or built in order to be used, as a separation of any building from any other building, with a view to the same being occupied by different persons. The first point that strikes one about this definition is that if it gives an adjoining owner a right of user of a wall that has been erected by the building owner by his placing a building against such wall, if it is allowed to remain, he, the adjoining owner, acquires a right of enclosure, and the building owner will find it very difficult to get of this right. An acquired right of this kind cannot be too carefully guarded against in the first instance; for by the judgment of *Angus v. Dalton*, which is a House of Lords case, "after twenty years' uninterrupted user of support, if it be open and not surreptitious, by the Prescription Act the owner of the dominant tenement is given the indefeasible right of support for his building from the land and building of the servient tenement."

I will explain shortly a case by an illustration. A has a house, bounded on one side by an external wall, *xx*, built entirely on A's land, and in this wall A has windows above the ground-floor which have existed for over twenty years. B one day erects a lean-to building that does not affect any lights or injure in any way A's wall *xx*. After twenty years B acquires a right of user and enclosure in A's wall, and therefore practically he acquires a small slice of land. This really might be the effect of the doctrine in the case of *Angus v. Dalton*. A's only remedy, it seems to me, in the first instance, being either to restrain the adjoining owner by an injunction (which would be difficult to obtain, as the wall has not been interfered with or in any way damaged), or to pull down his own wall (which of course would be absurd) so as to prevent the right being obtained.

Several cases similar to this have come to my knowledge, and the losing, practically, a slice of land might not, perhaps, be A's only hardship. Suppose, for instance, A wishes to pull down his building and rebuild. Section xvii. of the Metropolitan Buildings Act says, "And every party wall shall be carried up above any part of any roof opposite thereto and within four feet from such party wall;" and section xiii., "But no opening shall be made in any party wall except in accordance with the rules of this Act."

If these sections are to be read literally, A will be debarred from having any windows in his own wall, as now it has become a party wall under the definition in the statute. This is a case that I am inclined to think sometimes arises in this way. A, perhaps, is a neighbourly man, and on good terms with his neighbour, and is not to his knowledge in any way interfered with by the lean-to put up by B, nor does he understand the rights he may lose, and probably does not even know that B has not a wall of his own inside under his roof, and the difficulties do not arise until A wishes to take down his building and rebuild.

Now the question we have to consider in respect of this wall is, first, Has the upper part above the lean-to, namely, that part that encloses A's building, become a party-wall? It certainly does not separate two buildings at this point, and is entirely built by A on his own land. I think that the well-known case of *Weston v. Arnold*, though a Bristol case, must apply to a case of this sort in the Metropolis. In that case it was held that where a wall for a few feet from the ground was the dividing wall between two houses, and above that was the outside wall of one of them, the lower part might be a "party wall," and the upper part was not. A wall might be a party wall within the meaning of the Bristol Improvement Acts, 1840 and 1847, for part of its length or height, and an external wall for the remainder of its length or height.

There is another case, namely, that of *Knight v. Pursell*, and it was there held that "so far as the buildings extended on both sides of the wall it was a party wall within this Act," namely, the Metropolitan Buildings Act. Now, how are we to answer the question, Is the upper part above the lean-to a party wall? I think in the face of the Bristol case, which, though a local case, interpreted Acts which contained provisions somewhat similar to the clauses in the Metropolitan Buildings Act, namely, that there should be no openings in the party walls except under certain conditions, and in the face of *Knight v. Pursell*, and after reading the definitions of party wall, I should say, No; the upper part is not a party wall, but an external wall—that is, of course, from 15 inches above the top of the lean-to upwards. The second question is, Can A have his windows again?

I think so, certainly. The Bristol case of *Weston v. Arnold* again helps us here.

A wall in Bristol separating buildings, but having in it, above the buildings, windows enjoying rights of light, was condemned as a party wall under the local Acts, on proceedings taken by the owner of the light, and ordered to be rebuilt. The Acts contain provisions that there shall be no openings in party walls of new or re-erected buildings, except iron doors for communication between the separate buildings. It was held that the Acts did not apply to these windows, and that the owner of the lights could maintain a suit to restrain the erection of a building that would interfere with them; also in *Crofts v. Haldane*, and this is a London case. It was there held that the right to raise a party structure does not authorise the raising of a structure so as to obstruct ancient lights in the adjoining premises, and Mr. Justice Blackburn said, "There is a series of enactments in Part iii. of the Act (*i.e.* the 1855 Building Act) which do, for obviously good reasons, enable the building owner to deal with party structures in a way in which he would have no right at common law; but there is not one word in them to indicate an intention that he shall be at liberty to raise a wall so as to interfere with a neighbour's right to light, any more than there is to take his land."

This view also seems to me to agree with the definition of party wall, namely, a wall used as a separation of any building from any other building. I do not think anyone could say that that portion of the wall *xx*, some 40 feet above the lean-to building, was a separation between two buildings. Either we must accept in London the Bristol case or sections xiii., xvii.; and definition of party wall cannot always be complied with literally without great injustice.

I will give another example, while we are considering this question, of what is a party wall. *Y¹ Y²* is a party wall separating two buildings belonging to E and D, and supported on girders, stanchions and piers. F is a public passage at ground floor, E has a shop front between *Y²* and *Y³* next public passage; D takes his building down, and wishes to erect a higher building. The party wall *Y¹ Y²* is insufficient in thickness and strength for the greater height and weight, and the stanchions and foundations that are in E's building are insufficient in strength for carrying the greater weight to be placed on them. E objects to have his ground floor or shop front or his basement interfered with at all. D has a right to take down the party wall if insufficient, but of course he must go through the proper procedure; but has he a right to go into E's premises and build up sufficient piers and stanchions to carry the extra weight he proposes to place on them? I think not, without E's consent, and probably E would not allow him to do so without adequate compensation, as I do not think it could be maintained that the lower part is a part of the party wall, though there is certainly a right of support thereon.

This is a very difficult case, and one which I do not think

the Act provides for, and the only way in my opinion to arrive at a satisfactory settlement would be to place the whole matter, including the easement of support from the external part below first floor, before the third surveyor, and for the two surveyors to abide by his decision on the whole case, and to agree to sign the award; but even then the award might not be altogether in accordance with the Act, and if either D or E did not agree to it, it might be upset.

While we are on the question of what is a party wall, I shall read what Mr. Justice Fry said in the case of *Watson v. Gray*, which was a Middlesbrough case:—"As to the meaning of 'party wall' in a conveyance, it has a meaning 'rather popular than legal.'" He goes on to say the word "party wall" may be used in four different senses:—

1. A wall of which the two adjoining owners are tenants in common; this is the most common and the primary meaning of the term.

2. A wall divided longitudinally into two strips, one belonging to each of the adjoining owners.

3. A wall which belongs entirely to one of the adjoining owners, but is subject to an easement in the other to have it maintained as a dividing wall between the tenements.

4. A wall divided longitudinally into two moieties, each moiety being subject to a cross easement in favour of the owner of the other moiety.

As this case was a Middlesbrough case, and does not affect us here in London very much, except so far as party fence-walls are concerned, I do not intend to go very deeply into it, but if anyone wishes to see the case he will find it fully reported in Professor Banister Fletcher's book. Shortly it was this:—The plaintiff occupied a house; the defendant occupied another house adjoining. The yards adjoined at the rear. The plaintiff erected a shed against the wall, and raised the wall between the yards. The defendant knocked down with a hammer the raised portion of the wall. The plaintiff then brought an action for damages.

Mr. Justice Fry said:—"I am of opinion that the wall in this case belongs to the plaintiff and defendant as tenants in common; either tenant might have wished to train fruit trees there, or to amuse himself by running along the top of the wall," so the defendant was quite within his rights in knocking the raised portion of the wall down.

Mr. Beadel, in his able paper on the subject read before the Surveyors' Institution, gives the apt illustration of the showman Barnum, which I shall quote here. The showman Barnum and his partner had an elephant used for exhibition purposes; the partner not handing over to Barnum his half share of the profits thus arising, Barnum threatened if he did not do so that he would shoot "his half" of the elephant. There he was wrong, as he could not kill his half without injuring his partner's half, and, therefore, wronging him. So it is with a party wall; the owner on one side, if he damages the wall, though on his own side, injures the enclosing wall of his neighbour's house, and therefore it is only right and necessary that he should be restrained by enactments from doing any injury to what is really part of his neighbour's house.

(To be continued.)

At the conclusion of the paper, after remarks from Mr. J. Douglass Mathews, Mr. H. Lovegrove, Mr. Bernard Dicksee, Mr. White, Mr. Blashill, Mr. H. C. Clarke, Mr. Cole, Mr. Huntley Gordon and Mr. C. H. Bedells, a vote of thanks was passed by acclamation to Mr. Woodthorpe.

LEEDS ARCHITECTURAL SOCIETY.

AT the meeting of this Society, held on Monday in the Law Institute, Albion Place, Leeds, and presided over by Mr. G. B. Bulmer, a paper entitled "Notes on Some Bavarian Towns" was read by Mr. E. Guy Dawber. Sketches and photographs of streets, buildings, &c., were shown on the screen, and served to illustrate the lecture. Mr. Dawber took his audience through some of the quaint old towns around Wurzburg. For the artist as well as the architect, he said, there could not be a richer field. The houses in Rothenburg, although plain on the outside, had courtyards of great interest. The churches were exceedingly quaint, and the interiors of some were magnificent. At Wurzburg the bridge spanning the river was a feature of special interest. On it were rows of stately statues. The glory of Aschaffenburg was the palace standing on a noble terrace overlooking the river. Frankfort contained some beautiful examples of slate-hung houses. He remarked that the small slates used are, perhaps, preferable to the large ones of England, and that the slates used here are often greatly out of scale with the walls underneath them. A vote of thanks to Mr. Dawber was accorded on the motion of Mr. Dodgshun, seconded by Mr. C. Hall. In responding, Mr. Dawber said Rothenburg was simply a museum of beautiful architectural specimens. For an architect it was a perfect place.

ADAM ARCHITECTURE IN LONDON.*

By PERCY FITZGERALD, M.A., F.S.A.

(Concluded from last week.)

DESCENDING from general principles, we now come to his particular works. His first really important enterprise was the daring and ambitious scheme of the Adelphi—that is, the raising on the low-lying shore of the river a large and handsome quarter which should be on a level with the Strand.

My friend Mr. Wheatley has described this enterprise in an interesting monograph, and has dwelt particularly on the enormous underground structures which support the streets. These vaultings and arches are quite cyclopean in their character. The very areas of the terrace are like houses, and a couple of storeys in depth. The design of the terrace itself, thus raised in the air with its side streets, is really imposing. We at once recognise that the inspiration came from the palace at Spalato. Most of us will recall the fine effect when it overhung the river, from which it is now removed a long way. The houses which were occupied by Garrick and other persons of consideration are fine and spacious, and the rooms beautifully proportioned.

The Adam buildings have suffered so much from alterations and additions, that it is difficult now to form a correct idea of their original appearance. The pilasters and ornamental work are usually painted over, thus destroying the original natural tone of the stucco and the effective contrast between it and the brick. In this quarter of the Adelphi we have even a shop designed by him—Mr. Attenborough's.

In St. James's Street we often pass by without notice a rather uninteresting building, Boodle's Club, but where the great central window clearly proclaims its purpose—a large chamber within where the members could assemble. Mr. Fergusson bestows almost extravagant praise on the University Buildings in Edinburgh, which he commends for their perfect good sense and sincerity of expression. "The centre is bold and well marked and ornamental, without any feature so gigantic as to overpower the other portions." The wings are properly subordinate, and the arch at the bottom supplies a little piquancy. The cornice, he objects, is rather too slight. But on the whole, he says, "there are few buildings so truthful and so well balanced in design, or so satisfactory."

It will be interesting now to see what Adam has done in the case of a private mansion. In St. James's Square, on the club-house side, is found one of the most pleasing and effective of his works, the residence of Lady Williams-Wynn. Here he seems to have been allowed a free hand, and the result is most satisfactory. This stately house is at once solid and ornamental. We have his "large" style, and at the same time all those special ornamental graces in trifles of which he was a master. There are arches over the rectangular windows on every storey which, as the house is of stone, suggests strength. They really do duty in the way of support. The area windows have very marked arches a foot deep, which is fitting, as they have to bear the whole weight of the mansion. The arches of the parlour storey are less pronounced, as they have less weight to carry; those of the drawing-room still less; while the top storey, having no weight to carry, has no arches. This treatment gives, as in the case of Gosford House, an animation and life to the face of the house. Then there is the doorway with its graceful fanlight and expanding steps. Adam excelled in fanlights, though modern owners invariably remove them and substitute plate-glass. Instead of bold mouldings on his doors, Adam was partial to a sort of fluted pattern, which supplied richness of detail. The original knockers even of his design are here. Note also the fan-like flowing line of the stair-railings and the balconies, which have a logical purpose, simply as a support to rest on as you look out of the windows. I pass over the fine original stair, the beautiful chambers with their graceful alcoves crossed by columns, the charming little dressing-rooms and circular or hexagonal chambers. The whole is a masterpiece that will give pleasure to any one of true taste.

The Adams built a vast number of these stately mansions or palaces for the nobility. The most important of these was Scarsdale House—almost a palace—and which Dr. Johnson said would serve admirably for a court of justice. It is of a rather conventional pattern, and shows little of his peculiarities. Luton Hoo, which he built for Lord Bute, and which now belongs to the Danish Minister's wife, is rather conventional, though there is a pleasing piquancy in the semicircular portico.

But we find the most favourite—almost stereotyped—Adam type in Lansdowne House, Berkeley Square; that is, an ordinary square mansion with wings, decorated merely with a pediment and pillars and with wings added, originally built for

* A paper read before the Applied Art Section of the Society of Arts on Tuesday, January 30, and published in the *Society of Arts Journal*.

Lord Bute, a valuable patron, who then built two palaces from the designs of the same architect. Of this type, also, is Kenwood, Lord Mansfield's place at Highgate. They are what might be called good, workmanlike patterns.

At the bottom of Stratford Place is a house of similar pattern, very pleasing, from its correct proportion and its elegant colonnade. This harmonises with the place itself. The whole was built for Lord Aldborough, for whom he also built a more magnificent house in Dublin, one wing of which was a theatre, the other a chapel. It is now used as a barrack.

Adam's touch was always light and elegant, and was shown even in altering or remodelling existing structures. There was an ugly building in Whitehall—the old Admiralty—with an ungainly portico, the columns of which are out of all proportion, and for this he supplied a screen, which most of us will notice as we pass by every day. I was always puzzled at the praises lavished on this work, which was extolled as a great classical work. Its three openings seemed unmeaning enough. Examining it closely, I found that the pillars had been removed to make these side entrances, and that the architecture had been completely spoiled by the alterations, which destroyed its character as a screen. The old picture of the structure shows how different it looks when it was a real screen. But this is not all. The original design with its decorations seems really an elaborate and most effective one, and its present condition is a good instance of the way architects suffer from official interference with their designs; for all the ornamentation was suppressed.

I will give some other specimens of his delicate touch as applied to trifles. He built a bank for Mr. Coutts, the banker, in this quarter of the Adelphi. It was desired that he should connect the buildings by a bridge which crossed the street. We know what flimsy things these usually are—glass passages, ungraceful and uncomfortable to look at or to cross. Adam felt that, in the case of a bank, solidity and an air of solid security were the proper associations, and his bridge accordingly has an air of perfect propriety, and is almost Venetian in character. The eye rests on it with perfect satisfaction. The adjoining buildings have the same correctness, and even picturesqueness, expressing exactly, with their circular windows, the notion of the strong-room of a bank. In such matters as stabling, coach-houses and yards he always shows the same simplicity and effective design.

In Mansfield Street, out of Portland Place, is to be seen a little back yard with a coach-house that was inconveniently close to the back drawing-room. Not much can be made of a back yard, but with a few touches he made it an object pleasing to view. The whole is pleasing; the curves very graceful. Close beside Inigo Jones's Banqueting Hall, in Whitehall, stands the old, dilapidated United Service Institution. I have discovered that this was the joint work of two eminent architects, Sir John Vanbrugh, the builder of Blenheim and Castle Howard, and of Adam, who supplied the two rather insignificant wings. Here he certainly failed, just as he did at Finsbury Square, which is certainly a rather deplorable piece of work.

Sometimes to add an attraction to the front of an old house he would design a little lodge and railing. These ornaments were always effective. Other architects deal with such things in a rather ambitious way, and make Greek temples in miniature, like the Park lodges—just as Goldsmith said of Johnson, that if he were to write a fable on the little fishes he would make them talk like whales. There is a specimen of this class of work in front of the War Office, which shows power of expression, and another in front of Ashburnham House. Another of his *hors d'œuvres* was a showy gateway which he designed for Sion House, at Isleworth. We know the usual pattern of the nobleman's gateway; the lodge, the piers, the heavy railings and the rest. His theory was that the passer-by was entitled to such a display for his entertainment, even though it were a little theatrical.

The Adams were great contractors and concerned in many building speculations, such as the familiar Portland Place and the adjoining streets, Fitzroy Square, Finsbury Square, George Street, Westminster, and other streets. As Mr. Papworth, the curator of the Soane Museum, has pointed out to me, the money for some of these ventures was found by that eminent miser, Mr. John Elwes. No one can form an idea of the original appearance of Portland Place; it has been so much altered, storeys having been added to almost every house, the pilasters painted over, the pediments even removed. The interior spacious chambers remain, with their fine chimney-pieces and stucco ornaments. They were disposed in architectural blocks, the central ones being the most marked and most prominent. No. 25, now occupied by Captain Blake, Adam built for himself, and no doubt he made it as attractive as possible. Even as it stands, there is a pleasant correctness and reserve in the treatment.

Fitzroy Square, which I dare say few Londoners have visited, and some do not know, is a picturesque and architectural monument, worthy of Bath itself, which is saying much. The two sides are of stone, garnished with his favourite stucco

friezes, which harmonise admirably. But it is now in a forlorn and dilapidated condition. It was a favourite principle of his to treat a row of houses like this as though it were one long, single building. It has been objected to on æsthetic grounds that this treatment is an architectural fiction or deception, as it is really only a number of houses grouped together. But it may be said that when a whole terrace of houses is thus erected at the same time, it is really one great mansion, for they are under one roof, and each has not its own four walls, but is separated from its neighbour merely by a party wall. It is, in fact, one great house partitioned off into compartments. In Portland Place we find one of his pleasing mansions, Foley House, the back of which has an almost theatrical grace. There is something of the Italian villa here.

Adam also exhibited his talents in theatre-building, always attractive to an architect, and designed the New Drury Lane Theatre for Garrick—a sensible and expressive bit of work conceived in a Classical spirit. The interior showed all the regular and correct Adam ornamentation, and can be recognised at once as his work. It was engraved by Bartolozzi, and the figures on the stage are portraits of the manager and his wife. I believe there are only two instances of his having designed a church, that of Mistley, in Essex—and this is not a very successful work—and that of St. George, in Edinburgh. The ecclesiastical style was, perhaps, not in his way. He also designed tombs, some of which are in Westminster Abbey.

But while thus contributing to the beauty of the street and the country, the architect was even more brilliantly successful in his arrangement of interiors. He wished to offer a complete contrast to the style then prevailing—to the flat ceilings and enormous, ponderous cornices, huge monumental chimney-pieces—which were called tabernacles, all in imitation of the treatment of rooms in palaces. They were dark and gloomy chambers, heavy in treatment, of which we can see specimens in Grosvenor and Portman Squares. Nothing could be more original and imposing than his grand suites of rooms, staircases and lobbies. We may, however, wonder how he got so much out of the limited space. From this nice sense of proportion, they always suggest the idea of grandeur and size. In his mansions he introduced the fine arched, not coved, ceilings profusely decorated, and he would separate a chamber from a lobby by an opening supported by pillars. There were also oval and circular rooms.

Most striking are the original curves of the ceilings, the arched recesses at the side, the pillared vista at the end, the chimney-piece, the urn and the chaste reserve of the frieze in such abundance of decoration. My friend, Mr. Sala, says justly that a lovelier room does not exist than the circular breakfast-room at Lansdowne House.

Such was the house of Lord Derby which was unnecessarily pulled down many years ago, and a modern mansion erected in its stead. But even a greater surprise would be the result if we visited the library of Sion House, the Duke of Northumberland's mansion at Isleworth, when this splendid elaborately decorated apartment would greet us. The luxuriance of the decoration here is quite astonishing. Here, again, we have perfect wealth of decoration, and yet it scarcely seems overcharged. It will be noted that the shelves make part of the construction, being sunk in the wall, which is fitting enough, as the "motive" of the room is books. The shelves or book-cases, therefore, should not be treated as pieces of furniture.

In the decoration of the ceilings Adam displayed an amazing fertility of grace and fancy. It is said, however, that here he was largely indebted to Pergolesi, an Italian he brought from Italy, and who has published his own designs in a handsome volume. But on comparing these I find a greater formality and less freedom than characterise Adam's work. These ceilings were wrought in his favourite stucco, in light relief, and tinted in pale colours. These designs Adam styles "grotesque" in the strict meaning of the word—that is, such as were discovered in the old Roman grottoes. They are of the same type as that used in Raphael's Loggia in the Vatican. This tinting and colouring of the raised work does not seem to me very successful. I have seen in old mansions beautiful designs of this pattern flowing over the wall, half Pompeian, half grotesque. Indeed it is a difficult matter to know how to treat it. I have also seen some rooms elaborately gilt which produced an air of heaviness and emphasised the details too much. In the Soane Museum some thirty or more volumes of Adam's designs are preserved. I suppose there are some thousands of these drawings, some of them beautifully finished, and proving the astonishing power of the architect.

It is difficult to trace the origin of the decorative details in which he showed such a lavish profusion of invention. There is at times something Eastern in the complexity of the patterns. His borders leave a suggestion of the shawl pattern or Turkey carpet. He was fond of the repetition of a spade-shaped motive. Yet, notwithstanding this multiplicity of detail, there is nothing niggling, and breadth and richness of effect is secured without confusion. No one understands better that

canon of decoration which produces the effect of detail by broad touches without the aid of details.

In a striking passage Mr. Ruskin has explained this. He is praising one of Turner's exquisite vignettes in Rogers's "Italy," a little picture only a couple of inches square, representing the Doge's Palace at Venice, and he points out the rich effect of the carvings on the arches; but on using a magnifying glass we find that there is no attempt at representing carvings or details, but that the effect of such is conveyed by a number of artful strokes, dots and the like. This proves that the exact simulation of details does not produce the effect of detail.

Adam kept this principle well in view, and his decorations, when seen at a distance, seem to take more effective shape and do not become confused. The border which runs round the top of the hall of the Society of Arts has this effect.

The favourite garland, which he so regularly employed as a decoration, was not the common realistic imitation, but the refined abstraction of a garland. He sought merely the elegant repetition of the form—the refined form of the garland—the flowing, drooping, and rising of the line which is so pleasing to the eye. Even in his houses of an unpretending class, built for "jobbing" purposes, he did not omit to add his favourite graces and decorations. Thus a narrow hall he would set off by a rather elegant frieze, the details of which wore his favourite bull's head and rosettes, disposed alternately.

Adam had a fine eye for circular and oval forms, and there are refinements in these that would escape less delicate natures. Some of his oval medallions show a most refined feeling. Considering the affinity there is between the Adam style and that of Wedgwood, it is curious that we find no suggestion of any relation between the two men. One would have thought that artists so devoted to beautiful form and contours, in vases and other directions, must have been brought into contact; but I doubt if Wedgwood could have found any legitimate place in Adam's system. Adam was too conscientious to allow his chimneypieces to be mere frameworks for Wedgwood plaques and medallions, which would have diverted the attention from the general effect.

We find, however, from Miss Gerard's recent life of Angelica Kauffmann, that that artist's work, as well as Cipriani's and Zucchi's, were often found in company with Adam's. I doubt if even this co-operation is harmonious; and the delicate tracery and light tints seem to contrast too violently with the dark heavy tones of a centre painted in oils.

In such decorative adornment as ceilings and chimney-pieces and doors, our architect seemed to expend all his graces. An Adam door is a beautifully proportioned thing on which the eye rests with pleasure. They are nearly always double—what the French call *portes à deux battants*—which are always the true proportion. A single door is too broad in proportion to its height, and too great a burden to be balanced on hinges. They were usually of mahogany, with fluted or fluted work instead of mouldings, and of the finest workmanship. A friend of my own was decorating his house at the West-end, when his builder told him of some of these doors, which belonged to an Adam house that had just been demolished. He secured them. I never enter that mansion without being inspired by the sight of them, which have really a dignified and ennobling effect. With arches over them and a graceful entablature, they become most effective ornaments. The balance between height and breadth is perfect.

It will be noted what grace and originality is shown in the treatment of even the door-handles and door-furniture, which are truly elegant. The keyhole and handle are united by a graceful garland.

An Adam chimneypiece is a very choice and *recherché* thing; it finds its way to the dealers' shops, and now fetches high prices. The proprietor building a new house carefully removes the old chimneypieces. They are really exquisite works of art. Adam treated them constructively much as one would a doorway or a window. It forms really an entrance to the fireplace, and as an opening is made in the wall, there must be a construction to support the mass above. Nor did he adopt the false principle of making the top do duty as a broad shelf to carry all manner of articles. The top was merely broad enough to furnish a cornice, hence the effect is quite architectural. They were usually made of the finest statuary marble, and the carving is exquisite. I have seen some specimens in noblemen's houses, with inlaid marbles, lapis-lazuli, and set off by gilt ormolu that were astonishing.

I find in Adam's notes that for one house in Portland Place he made separate designs for every chimneypiece, even for that of the garret, nearly thirty in number. The same originally extended to his fireplaces, the ironwork of which is in perfect harmony with the rest.

I must now hurry on to another department which further displays the genius of these astonishing men. As I have said, they not only built the house, decorated it from top to bottom, but they furnished it entirely. It might be said, indeed, that they were the Maple & Co. of the era, only displaying more careful art than does that popular firm. In the house that I

described in St. James's Square, they supplied designs for everything—chairs, tables, mirrors, girandoles, wine-coolers, tea-caddies, knife-boxes, carpets, hangings, room-papers, all the silver, even to the cruet-stands, and it must be said every one of these articles is distinguished by an elegance of design that is surprising. Their room-papers were charming, both for tint and pattern, and I am glad to say there is a firm in Marylebone, Messrs. Woollams, who have reproduced many of the forms. The silver is designed rather after the Wedgwood-Bentley pattern, vases of classical shape, the work very slightly raised. We know what little design is usually expended on what is called door furniture—handles, plates, keyholes, &c.—yet even the garrets are furnished in this respect with his elegant designs.

Adam furniture is now much esteemed and sought, and is as much admired as sought. It is truly elegant in design and construction, and has much of the lightness, combined with strength, which distinguishes French makers, such as Reisner. His chairs—often graceful, oval designs—were intended as a protest against the broad, sinuous and somewhat coarse lines of the Chippendale chair. The Empire furniture often suggests the Adam in its outlines, and naturally enough, as it came from the same source. Much of Adam's art was in designing his furniture for the room, and even for the place in the room, it was to occupy. Thus his mantelpiece mirror, with the attendant girandoles, made part of the decorations of the fireplace. When he came to combine a mirror with a console table he was equally logical. Nothing can exceed the airy grace of these console tables, with their delicate limbs. He would combine, too, with his table and mirror, tripod candelabra.

His elegant fancy seemed to revel in these fanciful arrangements, and his imagination never seemed to fail him. In his designs for ironwork we find the same sense of propriety and gracefulness. There is a reserve and perfect sense of the capabilities of the material. His railings, balconies and lamps all show this correct and appropriate feeling. The balconies are delicate and geometrical in the details; they scarcely suggest the notion of cast-iron. They can be seen in abundance all over London. He had two or three favourite patterns for his balconies, all simple in design and suitable to the material, and contrasting with the tortuous and florid attempts of our time. He was equally successful in his area railings. Instead of the meagre top rail, pierced with holes, in which the vertical rails were fixed, he used a sort of ribbon with a pattern, which was better for the construction, and more romantically effective. On these railings were reared the standards for lamps and the extinguishers, a picturesque addition to the ornamentation of a house. These were in pure and correct taste, somewhat Greek in pattern.

Another article in which Adam displayed his ingenious variety of fancy was knockers. Though knockers have practically "gone out," we find the Adam knocker retained in many instances, a tribute, no doubt, to their artistic merit. He has many patterns of these, and showed himself conscientious in designing for each separate occasion. In this he resembled that admirable and versatile architect, whose loss we have to lament, Mr. Sedding, whose every effort shows the same spirit of thoughtfulness and fancy. He has a little "trade knocker," as it might be called, in the shape of a lion's head, full of expression. It suggests Stevens's, the sculptor's, little lion on the railing outside the British Museum; a sketch, but so quaint and spirited that artists often come and model it.

Of all the furniture found in modern drawing-rooms, perhaps the least art is expended upon the pianoforte. It pretends to be no more than a ponderous case of machinery. Adam designed a harpsichord, in coloured woods, for no less a personage than the Empress of Russia, and he made a rather elegant thing of it. Our architect even condescended to such things as sedan-chairs, and designed one for Queen Charlotte.

Such, then, is a review of Adam's work—imperfect, no doubt—but prompted by sincere admiration and diligent searchings.

THE STUDY OF IRISH ARCHÆOLOGY.

THE first meeting of the Waterford and South-Eastern Archæological Society was held on Thursday in last week, when the president (the Most Rev. Dr. Sheehan, Bishop of Waterford and Lismore) delivered the following address:—Archæology is properly defined to be the science which deduces the knowledge of past times from their existing remains. The term has, however, a much wider meaning in the title and work of our Society. It embraces for us men and things that have passed away, leaving only memories behind, as well as those which still exist in their ruins. While we have, therefore, nothing to do here with the concerns of to-day or yesterday, for they have their own societies, those which are conversant with contemporary literature, the progress of modern science, the present state of legal and medical knowledge and such like, we, on the other hand, include in our scope everything from the past that may interest or instruct us.

We seek to know what manner of men those who came before us from the beginning in the south-eastern counties were, and what manner of life they led, what they thought and did, what they said and wrote. We seek to trace their descent from Celt or Dane or Norman progenitor as well as their intermarriage one with the other. We push our way into the domain of history too. The archaeologist, in one sense, must precede the historian if history is ever to be written, as men of every civilised land have come to think it should. There was a time, indeed, and that not long since, when the historian thought it unbecoming the dignity of his art to write about anything less important than the large public actions of nations and their rulers. For such their history was little better than the record, more or less skilfully put together, of sieges and battles, of the rise and fall of dynasties, and the births, deaths and marriages of the royal and princely personages who composed them. The student of the past seeks a great deal more to-day, and it is fast becoming freed for him in all other countries.

We must not be behindhand; nor can we forget that this corner of Ireland has its own local history, which the ordinary historian will not describe for us, and could not if he would, and yet for many of us the events recorded there are just as important as most of those which form the staple of what is known as Irish history. Every county, every barony in every county had its own men of light and leading in their day. They are altogether forgotten for the most part, and where they are remembered it is only by their names and one or two leading facts in their lives. It is for the people in each district of the country to revive the memories of such men, where there is anything in them to revive. There are many historic spots and historic buildings; there are, for instance, many places in which battles were fought, not such as decided the fate of the nation, but that transferred power, very great if not altogether supreme within its own sphere, from sept to sept, from family to family, from the native to the stranger, and from the stranger back again to the native. There are graveyards to be found in almost every parish, where the dead of the parish sleep—many who left after them no story; the few who in their day had the making of the country's history. There are the raths and the cromlechs and the ogham stones. Some are still sealed books, others have, in the hands of earnest, skilful investigators, thrown a bright light upon chronology and family history.

But far beyond any of these we have in greater or less abundance in every county two classes of ruins possessing an attractiveness all their own to the lovers of antiquities—old castles and ecclesiastical buildings, such as old churches and monasteries. The number of Irishmen who are so dead to the stirring memories of the past as to go past these unheeded is small indeed, but a love of country, high and holy, has invested them for the Irish antiquarian with an interest that is as delightful as it is absorbing. Every stone in the ivy-clad ruins is dear to him. He examines them with care. He gathers up the fragments wherever he can find them. He cares to know by what Irish chieftain they were raised and what particular purpose they were destined to serve, the sieges through which they passed, the fate which attended them when they came into the hands of the conqueror. The church may be one of those great piles with massive wall and strong-set arch and delicate tracery of window and doorway, like that which stands not far away at Cashel; or perhaps it may be the small rural chapel, like that at Tubria, without any work of beauty upon it or even ordinary skill, as we should regard it, but only bare, decayed walls now, for the weak roof fell in long ago. Grass and weeds are tall and thick on the untrodden floor. High or lowly—it matters not to the true antiquarian—each has its spell for him. More attractive still, because more extensive and beautiful, are the old monasteries. We in Waterford possess, I believe, only two monastic ruins of any importance—one in the city, and another in the county, on the Blackwater, but Wexford and Wicklow have several, and in Tipperary Holy Cross stands almost without a rival in Ireland. The monks who prayed and chanted within those walls and their names are forgotten for centuries. "The loud hosannah no longer rolls" along the arches there, and the bats and the wild birds have built their nests in the sanctuary, but there is no one, no matter who or what he may be, that does not feel himself touched by the genius of the place as he faces the ruined cloisters and wanders over the desolate chapels. In an age when time and money are unsparingly given with the applause of Christian peoples to the preservation of Pagan monuments in countries thousands of miles away, it were certainly not creditable that Irishmen should permit the few traces of past glory that still remain to them to sink into the utter oblivion that now covers the once great monastery and school of Lismore.

There are besides existing remains four different sources from which a knowledge of the past may be derived by our archaeologists—printed books, manuscripts, newspapers and traditions. The number of printed books available for our

purpose is unfortunately very small. The Irish were the last people in Europe, it is said, to use a printing-press. Before the middle of the last century but little attention was paid to the history and antiquities of the country. Of the books published on these subjects before or since that date many have been lost to us. Still a sufficient number must remain to be of material help to the diligent student. Indeed, there are few of us who have not at some time or another heard of a book found in some neglected corner, stowed away in an attic, or lying forgotten on the shelves of a bookcase, that contained information of an interesting, if not important, character about places, persons or events connected with the locality.

If our national literature be poor in printed books it is surpassingly rich in manuscripts. Few persons who have not given special attention to this branch of the subject are, I believe, at all aware of the extent and variety of this manuscript literature. Time and its vicissitudes have dealt hardly with our ancient records. Not to go far back, Keating, when he wrote his History of Ireland in the woods and glens of Tipperary, about the year 1630, had many which have long since disappeared, and the author of the "Annals of the Four Masters," writing about the same date, had a still greater number which have shared a similar fate. Those that remain, however, may be counted by hundreds and probably by thousands. The author of the article on "Ireland" in the recently published edition of "Chambers's Encyclopædia," speaks of a M. de Jubainville who has counted 953 in the libraries of England and Ireland. How many are to be found in the Burgundian Library at Brussels, in the Spanish national archives at Limancas, as well as in the libraries of France, Italy, Germany and Switzerland, we cannot tell, though it is certain there are many. Dr. Douglas Hyde, in a lecture lately delivered in Dublin, stated that the number of existing Irish manuscripts written between the eleventh and seventeenth centuries would fill a thousand octavo volumes. O'Curry does not hesitate to say that the materials for writing the history of Erin are perhaps more abundant than the ancient and contemporary records of any other European country. These older manuscripts embrace every branch of knowledge possessed by the civilised world at the time they were written—the Greek and Roman classics, the writings of the Fathers of the Church, Pagan mythology, history, grammar, poetry, law and medicine. By far the greater part has never been as much as examined. It was so at least when O'Curry wrote his classic work on Irish manuscripts, five-and-thirty years ago. Something has been done since then, not merely by Irishmen, but, strangely enough, a good deal more by foreigners, and especially by German scholars, towards unlocking these treasures.

There are not wanting signs that we are on the eve of witnessing still greater and more successful efforts at home in the same direction. Irishmen are beginning to awake to the thought that they have a literature that is worth preserving, that much more remains to them as their inheritance from the days when Ireland was the "Island of Scholars" than those vague memories which have served to minister to patriotic pride in the rounded oratorical periods and the stirring cadences of the poets. The causes which have tended to turn the attention of capable men amongst us in other directions are fast disappearing, and, what is better than all, an earnest and it would seem a well-considered movement is being organised for the purpose of obtaining a thorough knowledge of Gaelic, without which all efforts, no matter how earnest, well meant and widespread they may be, are clearly foredoomed to failure.

The value of popular tradition for archaeological purposes has been almost altogether overlooked in Ireland. Three or four novelists of the last and second last generations just tapped the source and drew a little for the moment's need and then turned it off, leaving a rich supply behind for those industrious enough to draw it before it comes to be dried up for ever. No one who has enjoyed familiar intercourse with the Irish peasantry, particularly with those of remote districts, can have failed to observe that there exists among them an abounding store of such traditions; nor is that store less varied than abounding. It has preserved to us the tales and stories of our ancestors, the knowledge of their customs and manners, their amusements, their ballads, their songs, their superstitions, and the thousand and one things that go to make up the private and domestic life of a people. No one need be told of the interest that naturally attaches to such subjects; besides, they form a part, and that no mean one, of history, as it is understood, and rightly understood, to-day, and so we find that at this moment every nation in Europe is busy in the preservation of its folk-lore.

I should wish to put in a special plea for the collection of our old Irish airs. I suppose I show myself very much behind the times in expressing a liking for them beyond many others that I know of, but I cannot help having this liking, nor can I help thinking that, no matter what may be said to the contrary, they have for every Irishman a charm that no amount of

popular neglect or fashionable disdain will ever kill. There is not, I believe, a feeling in the Irish nature that they have not power to evoke, not a chord in any Irish heart that they may not touch, not a passion that they may not sway. And this is true not of one class, not of one phase of existence only. It is all the same for the grey-haired old man and the child that sits on his knee, for the student and the farm labourer, for my lady and her maid. In the hall and in the hut, in joy and in sorrow, in success and in failure, to welcome the wanderer home or to mourn the dead, by the banks of the Shannon or the Mississippi, on the Indian hillside or in the cities spread beneath the Southern Cross, it has the same magic power to reach, to hold, to stir.

THE LATE GOURLAY STEELL, R.S.A.

WE regret, says the *Scotsman*, to announce the death of Mr. Gourlay Steell, one of the oldest and best known members of the Royal Scottish Academy, and Her Majesty's animal painter for Scotland. Mr. Steell, who was seventy-five years of age, has of late been a victim to asthma, and for several winters past has had to take the greatest care of himself. During the recent severe weather he had suffered considerably, but was engaged on a picture which he had hoped to finish before the sending-in day for the annual exhibition. It was entitled *Lochaber no More*, and showed a Highland interior with the bagpipes lying on a wooden table, a Scotch terrier on the floor, with a doleful expression, and a small portion of a box-bed in the right corner, suggesting that the occupant would no more play his favourite instrument. The subject is a pathetic one, and is doubly so in the light of what has occurred. The brush dropped from the hand of the painter before the picture was finished, and before the paint was dry the artist had been called away for ever. Mr. Steell had evidently caught cold, and this developing into pneumonia within the last few days, cut him off rather unexpectedly.

Born in 1819 in Edinburgh, and educated there, Mr. Gourlay Steell was the son of John Steell, a well-known wood-carver of his day, some of whose public works still remain to testify to his artistic tastes and skilful hand. Mr. Steell's older brother was the late Sir John Steell, the well-known sculptor, and it was in their father's atelier that both the lads developed their artistic instincts. His early art training Mr. Gourlay Steell received in the school of the Board of Manufactures under Sir William Allan, the first president of the R.S.A., and in the private studio of Robert Scott Lauder, whom so many of the older generation of Scottish artists can claim as master. At the early age of thirteen Mr. Gourlay Steell exhibited in the Royal Scottish Academy Exhibition, then held in a gallery in Waterloo Place, which is now converted into the Edinburgh and Leith Gas Offices, a model of a greyhound. This was in 1832. In 1835 he exhibited a life-size study of a bloodhound, and from that time to this—well on to sixty years—his name has rarely, if indeed at all, been absent from the catalogue of the exhibition. He had from the first a fondness for animals, and it was as their painter and delineator that he was to make his mark. Going over the list of his exhibited works in the Royal Scottish Academy, it is surprising to find how many of them are portraits of horses and dogs, or of Highland cattle in the field or in the byre. Mr. Gourlay Steell was an admirable draughtsman; he had studied the horse and the dog to some purpose, and could draw them with great facility and vitality. He thoroughly understood their nature also, and could hit off their characteristics with singular truthfulness of expression. His excursions into the Highlands brought him into contact with the picturesque Highland cattle; and, as the frequenters of the exhibition on the Mound know, many of these beautiful animals formed frequent subjects for his brush. Some of these pictures were executed with an expressiveness and power which, as early as 1857, led the Edinburgh papers of the time to speak of him as the Scottish Landseer. A picture of Mr. Steell's which attracted much notice in that year was *Llewellyn* and his brave hound *Gelert*, a replica of which was afterwards painted for the Queen; and a few years later he produced his *Highland Raid*, which was also highly spoken of. In it he depicted the Clan Macgregor defending the cattle they had "raided" against a sudden attack of the Royal troops—a subject which he treated with much spirit. The excellent painting of the cattle and sheep was, of course, a feature in the work. It was bought by the Royal Society for the Promotion of the Fine Arts, and was made the first prize in the art drawing of that year. Mr. Steell, who had been elected an associate in 1846, was in 1859 raised to full membership, and he signalled himself that year by producing a picture of prize West Highlanders, and another having for subject the death of *Old Mortality*—one of many pictures suggested by incidents in the *Waverley Novels*. In these early days Mr. Gourlay Steell did a good deal of book illustrations—drawing his pictures on the wood blocks; and for a dozen or more

years—in the forties and fifties—he was the successful teacher of modelling at the Watt Institute in Adam Square—a position in which he succeeded his father. He had a distinct gift for modelling as well as for painting, and from his hands there came many designs in clay of presentation groups of dogs, horses and cattle, which were afterwards executed in silver by Edinburgh silversmiths who had entrusted him with such commissions. Of teaching he was very fond, and many of his students took good positions in the art world.

Early in his career Mr. Gourlay Steell formed a connection with aristocratic patrons, which he maintained until the close of his life. He was constantly requisitioned to paint some favourite dog or pony belonging to members of the nobility or landed proprietors of Scotland, and his commissions often included their children along with some pet animal. He was in this way known in many of the mansion-houses of the land, and was a favourite wherever he went, for he was a man of most agreeable manner, and, like many of his brother-artists, a good conversationalist. He painted two important hunt-pictures which were engraved, viz. an equestrian picture of Colonel Carrick Buchanan of Drumpellier, accompanied by his huntsmen and squires and the favourites of his pack of foxhounds (exhibited in 1872), and a similar picture of the late Earl of Wemyss, which was presented at a dinner at Coldstream in 1863. He also executed equestrian portraits of the Earl of Eglinton and Winton and of Mr. Andrew Gillon of Wallhouse; and a notable picture of his in 1868 was the late Lord President Inglis and a shooting-party at Glencorse. One of his best-known pictures, painted in 1865, was entitled *A Cottage Bedside at Osborne*, and depicted one of those gracious Royal incidents which have made the name of Her Majesty beloved in every cottage in the land. It shows the Queen seated at the bedside of an old fisherman, reading to him the Scriptures. The picture was engraved, and had an immense sale all over the land. In 1872 Mr. Gourlay Steell had the distinguished honour conferred on him of being appointed animal painter to Her Majesty for Scotland, and in pursuance of his office he painted portraits of many favourite animals belonging to the Queen and Prince Consort that are now in the Royal collection. One of his large pictures, *The Pass of Leny—Cattle Going to Falkirk Tryst*, is also owned by Her Majesty. Latterly Mr. Gourlay Steell has been engaged in executing a number of colossal works in oil, tempera—a medium in which he greatly excelled—and in charcoal, chiefly for the decoration of Highland and other mansions. The subjects were of a sporting character—introducing deer, horses, cattle, sheep and wild animals of the chase. Mr. Gourlay Steell's charcoal studies were always good, executed as they were with great freedom and power, and at Lord Tweedmouth's shooting-lodge at Guisachan some very fine decorative works by Mr. Steell were placed a year or two ago. A later work of note was *A Challenge*, exhibited in the Royal Academy (where he had frequently exhibited) and in the R.S.A. Exhibition; and his last model was a Highland bull, now cast in silver, for the late Lord Seafield. For many years Mr. Gourlay Steell held the office of animal painter to the Highland and Agricultural Society. In 1882, in succession to the late Sir William Fettes Douglas, Mr. Gourlay Steell was elected curator of the National Gallery of Scotland, and in that position took great interest in the national collection of pictures under the care of the Board of Manufactures. With the students and others who copy there on Thursdays and Fridays Mr. Gourlay Steell was a great favourite, always ready as he was to give them a word of encouragement, and on occasion, brush in hand, helping them out of some difficulty. He was a man of excellent taste, and in the course of his life had got together a fine collection of armour and antiquities of various kinds, bits of which occasionally appeared in his pictures.

In his earlier years Mr. Gourlay Steell was in the Yeomanry, and all his life was fond of outdoor exercises. He was a good shot and a keen angler, and had many pleasant stories to tell of both pursuits. One of the outstanding features of his life, however, was his enthusiasm for his art. He was a most industrious artist, and was never happier than when he had the pencil or brush in his hand. The amount of work that came from his hand must have been great. In his day few could excel him in the delineation of animals—dog, horse, or shaggy Highland cattle. He did not belong to what used to be called the "Spiritualist School" of animal painters, in which Landseer was included. In his representation of animals he was eminently true to nature. Their varied characteristics were well known to him; he had studied them in all their aspects—their different expressions of countenance he understood, and could depict with unerring fidelity; but he was not given to reading more humanity into the face of horses or dogs, for example, than they actually possess. As a colourist Mr. Gourlay Steell had his faults. Latterly especially, his colour was sometimes wiry and thin, and his tendency to over elaboration of the background and accessories of his works often detracted from their pictorial character. But it would be manifestly unjust to judge of an

artist by his later day work; and in his prime Mr. Gourlay Steel did credit to that particular branch of art to which he was so much devoted. Personally Mr. Gourlay Steel was one of the most likeable of men. Though exceedingly sensitive in many respects, he had a genial and kindly manner, which made him many friends. From his place in the Academy and National Gallery he will be greatly missed.

Mr. Gourlay Steel, who was twice married, is survived by three sons and a daughter. One of his sons is Mr. D. G. Steel, A.R.S.A.

THE FRENCH "ECOLE DES CHARTES."

A CORRESPONDENT of the *Manchester Guardian* who is enjoying the advantages of study in the Ecole des Chartes gives the following account of the institution:—

The teaching of the Ecole des Chartes has a double aim. It is at once scientific and practical. The student is taught the subjects necessary for a first-hand knowledge of Mediæval French history, and is at the same time trained for the work of a librarian or archivist. The school, which possesses a library of its own, is now housed in a building adjoining the national archives. It is under the control of a director and "Conseil de Perfectionnement," chiefly elected by the Academy of Inscriptions and Belles Lettres. The staff consists of eight professors. The course of study extends over three years. Only twenty pupils can be admitted each year, and every candidate for admission has to present the diploma of Bachelier èt Lettres, and in addition pass an entrance examination in Latin and French history, with a foreign language. During his first year the pupil attends courses on palæography, Romance philology, and bibliography and classification of libraries. Before passing into the second year he must pass an examination in the subjects of the first year, and a similar examination has to be gone through at the end of the second and third years. The second year's course consists of diplomatics, history of French institutions, sources of the history of France and classification of archives. The third year's course consists of the history of the civil and canon law, Mediæval archaeology and a continuation of the course on the sources of the history of France. After passing the examination at the end of the third year the pupil must present a thesis on some subject connected with the studies of the school. If it is accepted he receives the diploma of "Archiviste Paléographe."

The lectures, which are open to anyone who likes to attend them, are given in a not over-large room, with a horseshoe-shaped partition surrounding a table in the middle, round which the pupils sit. The general public sit at the tables outside the screen, to which the pupils also often overflow. The general public, or auditors as they are called, take only a passive part in the work of the classes, though they are supplied with facsimiles, &c., in the courses where these are needed. The course on palæography is conducted by M. Léon Gautier, who strives to communicate to his pupils a sixth sense, which he calls the "sens paléographique." He urges them on in the reading of facsimiles by exclamations of "Allons!" "Marchez!" "Courage!" "Bon!" the last sometimes ironical, after the laborious decipherment of some obvious word by a pupil. He is the embodiment of life, energy, enthusiasm and humour, and truly declares that his heart is still young in spite of his sixty odd years. M. Giry, who is about to bring out a large treatise on the subject, is the professor of diplomatics. He comments on the various Mediæval documents, facsimiles of which are in the hands of his hearers, explaining their nature, pointing out the elements which establish their authenticity and validity, and criticising the abstracts of them made by the pupils. The latter extremely valuable exercise trains the future archivist and historian in disentangling the essentials of a document and preparing inventories of the documents under his charge. Other courses worthy of particular notice are those of M. Paul Meyer, the director of the school on Romance philology, and M. de Lasteyrie on Mediæval archaeology. M. Paul Meyer, whose name is held in honour by philologists everywhere, begins his course by a most interesting sketch of the extent and distribution of the Romance tongues, especially French, before proceeding to the study of the dialects and periods of old French. M. de Lasteyrie begins the history of Mediæval architecture by giving a sketch of the art of building in Roman times, and shows how each change in style was brought about by practical needs. Of the other courses, it may be said that their most valuable feature is the imparting of an extensive and systematic bibliographical knowledge. The student who has followed the three years' course ought to be well equipped for the work of his thesis. The theses very often result in extremely valuable work. We may cite as instances that of M. Bémont in 1876, which has since expanded into the best all-round biography of our English hero, Simon de Montfort, and that of M. Langlois in 1885, "Le Gouvernement de Philippe le Hardi," since expanded into the standard monograph

on the reign of that king. The list of distinguished *alumni* of the school includes M. Paul Meyer, the present director of the school; M. Gaston Paris, the distinguished philologist; M. Himly, the Dean of the Faculty of Letters at Paris; M. d'Arbois de Jubainville; M. L. Delisle, the Administrator-General of the National Library; the late MM. Luce, Mas-Latrie, Boutaric and others. Foreigners can become pupils on passing the same examinations as Frenchmen, but they are not included in the order of merit in the examinations, though they receive the diploma after duly passing through the courses and presenting the thesis.

GENERAL.

Mr. E. Burne-Jones has been created a baronet, being the third English painter who enjoys the distinction. A baronetcy was also offered to Mr. G. F. Watts, but was declined.

Christ Church, Sowerby Bridge, was nearly destroyed by fire on Sunday night, when a fireman was killed. The building was erected in 1819.

Professor W. R. Ware having reported on the designs sent in for the library and museum in Milwaukee, which is to cost half a million of dollars, Messrs. Ferry & Clas, of that city have been appointed architects.

Mr. J. B. Wilson, of Glasgow, has been successful in the competition for the new United Presbyterian Church at Clydebank.

The National Gallery of Scotland has been reopened after being closed for nearly a month for its annual cleaning.

The Society of Engineers meet on Monday, the 12th inst., when the president, Mr. G. A. Goodwin, will deliver his inaugural address.

The Kilmarnock Art Exhibition, which was opened on December 21, has just been closed. It is stated that the sales of pictures amount to 904*l.*, and it is expected that they will exceed 1,000*l.* At last exhibition, three years ago, the sales amounted to 1,193*l.*

The Library Committee of the Edinburgh Architectural Association have issued invitations to a meeting to be held on the 15th inst. in the reference-room of the library, the committee being anxious to make the valuable works on architecture and kindred arts as widely known as possible. Sir T. Clark, Bart., will preside, and addresses will be given by the Lord Provost and Mr. Robertson, president of the Association.

Mr. Wm. Morris will give an address to the students of the Birmingham Municipal School of Art on the 21st inst., and distribute the prizes.

An Anonymous Lady Donor has sent 1,000*l.* to Archdeacon Blakeney towards his appeal for 6,000*l.* to put the Church day schools of Sheffield in a thorough state of efficiency.

The French Government have offered three prizes of 3,000 frs., 1,500 frs. and 1,000 frs. for the best designs for a postage-stamp to supersede M. Sace's allegorical composition.

The New Road west of Thirlmere was formally declared open on Saturday to the public by the Lord Mayor of Manchester. The road has been constructed according to the Act of Parliament which sanctioned the waterworks scheme, and at a cost of 29,000*l.* It is five miles and a half long.

Mr. A. J. Bloor is engaged on a history of the American Institute of Architects, for which he is to receive suitable remuneration from the members.

Messrs. Steel & Balfour, of Glasgow, have been appointed architects for the new Congregational church which is to be erected in Govan.

The "Ancient Company of Marblers or Stonecutters inhabiting within the town of Corfe Castle, in the island of Purbeck" held their annual meeting on Tuesday, for "the enrolment of apprentices, the registration of members' marriages and the discussion of questions affecting the company's rights and privileges." For centuries past only members of the company and sons of members duly bound as apprentices have been allowed to quarry stone or marble in Purbeck.

The Trustees of the late Mr. W. B. Barbour, formerly M.P. for Paisley, have agreed to vote 15,000*l.* for the erection of a new infirmary in the town, also 15,000*l.* for a new local grammar school, and to increase to 15,000*l.* the sum already contributed to the United Presbyterian Church.

The Earl of Chichester has given his consent to the Sussex Archaeological Society's request to be allowed to excavate the galleries and chambers recently discovered beneath the castle at Hastings.

The Architect.

THE WEEK.

THE gale on last Sunday night was destructive for buildings. The most important ancient example that suffered was St. Mary's Church, Shrewsbury. The upper part of the steeple, for a length of about 45 feet, fell on the roof of the nave, destroying the timbers and the greater part of the oak ceiling. The Vicar, in appealing for aid towards the cost of restoration, says that the building stands on the site of a previous Saxon church and has a Norman tower, on which a very lofty spire, reaching to a total height of 222 feet, was placed about A.D. 1440. The nave arcade is Early English, and the oak ceiling was of Perpendicular period. The tower and spire had shown signs of weakness, and workmen were engaged in replacing a part of the top of the spire. A heap of ruins 5 feet or 6 feet high can now be seen in the nave. Had the fall occurred an hour earlier about three hundred worshippers might have lost their lives.

LIFTS have become almost a necessity of life in cities and large towns, but owners of buildings in which they are introduced will do well to insure that lifts are made by firms who have gained reputé by such appliances. The mechanism is not quite so simple as is commonly supposed, and a defect in the materials or workmanship may involve expense that is many times in excess of the cost of the most perfect lift. The case which was decided on Tuesday in Mr. Justice CHARLES'S court exemplified the extent of the risk which is daily incurred. The plaintiff was a commercial traveller, who in last March, in company with two friends, called on the occupant of rooms on the fifth floor of a mansion in Oxford Street. In descending the lift stopped working. The attendant and the plaintiff's companions were able to jump on the landing. The load being lightened the lift again rose, and the plaintiff in his endeavour to escape was crushed, and when rescued was found to be in a precarious condition, although happily his injuries were not of a permanent character. The nerve weakness which followed interfered with his business. For the owners of the building it was contended that the injuries were not serious. The jury assessed the damages at 450*l.*, which was not an excessive sum. It is quite evident from the accident that lifts will have to possess an automatic governing power. The attendant in the mansion was without confidence in the machine, and his flight naturally excited the passengers. The effect of three men suddenly jumping from a lift would strain some parts, and the rebound is easily understood. Contingencies of the kind must always be assumed, for one effect of modern education is to make men readily panic-stricken, especially when in the company of a machine, and therefore provision must be made for safety to an extent which in theory appears to be exorbitant.

WE have mentioned that Mr. W. FRANK CALDERON was about to open a school of animal painting. It is now proposed to combine landscape with that subject, and accordingly Mr. C. E. JOHNSON has joined in the direction. The divisions will be treated alternately. There is no studio in London in which the practical training that is contemplated can be obtained, and the new school should therefore offer many advantages for students. The following artists have undertaken to serve as visitors:—Mr. BRITON RIVIÈRE, R.A., Mr. H. W. B. DAVIS, R.A., Mr. ANDREW GOW, R.A., Mr. HEYWOOD HARDY, Mr. S. E. WALLER, Mr. W. Q. ORCHARDSON, R.A., Mr. J. MACWHIRTER, R.A., Mr. COLIN HUNTER, A.R.A., Mr. DAVID MURRAY, A.R.A., Mr. E. A. WATERLOW, A.R.A. The term will commence April 23 and terminate July 14.

AN undertaking on which a Russian gentleman, M. THEODORE SABACHNIKOFF, has decided will do more to distinguish his country than the gaining of a victory over one of the Asiatic tribes. He has arranged for the publication of all the manuscripts by LEONARDO DA VINCI which are considered genuine. It is a most onerous and costly

task, but one that would be worthy of an imperial or royal amateur. The artist, as is well known, would not follow the everyday practice in writing, and his words run from right to left. In many cases he would appear to have used a peculiar code of words. From their novel character the preparation of facsimiles of many of the manuscripts has been all but impossible. By the agency of photography reproductions can be obtained which will be more perfect than the most careful copying. The first volume has been completed, and is the "Codice sul Volo degli Uccelli," an investigation of the principles of flying, with the object of creating machinery for aerial transit, which was one of the artist's dreams. The reproduction is accompanied by translations in modern Italian and French.

THE late Mr. COMBE, who was printer to the University of Oxford, was smitten with pre-Raphaelitism, and bought several examples of the works of the brotherhood. His widow has bequeathed them to the University. Among the pictures are *The Early Missionaries*, dated 1850, *The Afterglow in Egypt*, *London Bridge on the Night of the Marriage of the Prince of Wales*, and *Festival of St. Swithin*, by Mr. HOLMAN HUNT; several early pictures of Sir JOHN MILLAIS, including *The Return of the Dove to the Ark*, &c.; two oil-paintings and a drawing by BONNINGTON, sketches by DAVID COX and W. HUNT, and ROSSETTI'S *Dante's Celebration of Beatrice's Birthday*. A bust of Mr. COMBE, by the late T. WOOLNER, is also given. One of the conditions of the bequest is that the pictures are to be kept together for twenty years after the death of Mrs. COMBE's last surviving executor.

UNDER the title of "Documents Décoratifs Japonais," a new series of examples for students has been produced by the Librairie de l'Art, Paris. The examples have been faithfully reproduced from drawings of flowers, plants, birds, &c., and are useful not only from their suggestiveness, but as examples of facile draughtsmanship. The whole series will be published at a price that is almost nominal, and will be an ornament for the drawing-room as well as an aid in the studio and workshop.

THE Principal of the Technical School, Sheffield, Professor RIPPER, M.I.M.E., delivered an address on "The Testing of Materials," at the meeting of the Sheffield Society of Architects, on Tuesday. He explained the construction and method of using the testing machine, and afterwards conducted a series of experiments of a practical character, and including tests for cast-iron by tension, crushing and breaking a transverse test-bar. Mild steel and wrought-iron were also subjected to the tensile test. Samples of red deal were broken transversely and crushed. The crushing test was also applied to a sample of the ordinary red brick used in the neighbourhood. Lists of the experiments to be shown were distributed to the members; these gave the usual breaking weights of the various materials and spaces in which to record the results of the experiments witnessed. At the close of the address the Professor drew attention to the facilities afforded by the school for the pursuit of many branches of study necessary to the young architect, and expressed his willingness to meet the requirements of the architectural students by arranging for other classes.

AT this week's meeting of the Society of Antiquaries of Scotland, Mr. WALTER J. KAVE described a series of rubbings of memorial brasses from Yorkshire, which were exhibited to the meeting. The series included a full-size figure of a priest in eucharistic vestments from Wensley, date 1360; a figure of a knight from Aldborough of about the same date; figures of THOMAS DE TOPCLIFFE and his wife, at Topcliffe, near Thirsk, date 1391; of Sir JOHN MAULEVERER and his wife, at Allerton Mauleverer, date 1400; of WILLIAM FITZWILLIAM and his wife, at Spotborough, date 1474; an Archdeacon at Sessay, date 1550; and of THOMAS GASCOIGNE, at Burgh Wallis, date 1554. The varying details of costume and armour over the two centuries embraced in the period between the earliest and latest of the brasses exhibited were pointed out, and the total absence of brasses of the type in Scotland gave interest to the exhibition.

THE JARDIN DES PLANTES.

STYLES may come and styles may go, but whichever is fashionable, the Parisian designer remains faithful to flowers. In spite of all that lawgivers for art have laid down about geometric conventionalism being the one salutary principle for all ornament—a doctrine which he sometimes is compelled to respect, in spite of himself—his best work is sure to be heterodox, for it reveals his belief that the purest delight is to be obtained by employing floral subjects courageously. He is, of course, supported by the gratification of his countrymen and countrywomen, whose passion for flowers, and especially the costliest, is well-known; but it may also be said that he owes much to the associations which arise out of the existence of the Jardin des Plantes within the city. If the large area which is occupied by beds of flowers, conservatories, cages, libraries, offices, museums, lecture halls, &c., were sold to speculators for buildings, and if a new botanic garden were established outside Paris, say at St. Cloud or St. Germain, there can be no doubt that a great change would be produced in the industrial ornament of the French. It might be considered an advantageous change by the advocates of conventionalism, and there would be no lack of grace in the examples; but neither designers nor purchasers would be so well satisfied as they are at present. As the Jardin des Plantes is therefore a factor in French art which is not sufficiently appreciated by strangers, some account of its origin may have its use.

The gardens, as our readers are aware, form a sort of outskirt of the Quartier Latin on the left bank of the river. Where they are placed is not a fashionable quarter of Paris, being near the Halle aux Vins, the Salpêtrière Hospital and the Prison of Mazas. The inmates of dreary boarding-houses in the neighbourhood, like the Maison Vauquer, where BALZAC'S PÈRE GORIOT suffered, find the gardens to be a welcome refuge. They are far quieter than the Luxembourg, and a man who is melancholy through misery will not excite attention, for he will resemble the speculators on the Origin of Species and similar problems who there abound. When the first garden was called into existence in the seventeenth century, there was no intention of making it a refuge or introducing zoology, which for many visitors is the most interesting constituent of the institution. At first it was contemplated to create only a garden of medical Herbs, and it was the forerunner of the Apothecaries' Garden in Chelsea. In the seventeenth century there was a necessity for physicians to be herbalists, and HÉROUARD, who dosed LOUIS XIII., therefore proposed that His Majesty should order the formation of a garden in which that knowledge could be obtained. A model for it was to be found in Montpellier, which was established by HENRI IV. The king agreed; it may be he expected remedies for himself would be discovered. The death of HÉROUARD did not delay the realisation of the project. GUY LA BROSSE, his successor, was, if possible, more eager about the garden. Land was purchased in the Faubourg St. Victor, consisting of about twenty-four acres, and in 1640 the royal garden was inaugurated. During the first year LA BROSSE was able to have a space measuring 292 feet by 227 feet planted. In the catalogue which appeared in 1641, there are mentioned 2,360 plants. LA BROSSE died the same year, and was buried in a chapel in the garden. LOUIS XIII. followed in 1643, and the garden was neglected for a time.

It was not until 1652, when FAGON, a nephew of LA BROSSE and the favourite physician of LOUIS XIV., became superintendent, that progress was renewed. FAGON was no less of the enthusiast than his uncle, and travelled throughout France at his own cost in search of plants. He gained the support of COLBERT, who was able to recognise the advantages of the gardens for others besides students of medicine. The Minister may be said to have secured the co-operation of art in the place. GASTON OF Orleans had employed ROBERT, the painter, to execute a series of drawings on vellum of the plants in the garden of Blois. On the death of the duke in 1660 COLBERT not only was able to persuade LOUIS to purchase the collection of drawings, but to appoint ROBERT as artist to the gardens, which office he held until 1684. Many other able artists succeeded during the next two centuries, and hence it is that the collection of drawings of botanical subjects belonging

to the Jardin des Plantes is the most valuable in the world. About 1671, when a vacancy on the direction occurred, COLBERT arranged that the chief control of the gardens should be held by the surintendant des bâtiments, or in other words, by himself, while the first physician to the king should be intendant. A staff of professors was appointed, the most renowned being TOURNEFORT, who taught botany. He was the first who established a rational system of grouping plants. He filled the chair of botany for about thirty years, and students came from all parts to hear him. In 1708 he was crushed by a waggon in one of the narrow streets of Paris, and died from the injuries he received. TOURNEFORT left his herbarium and collections to the gardens. His successor was a failure, for he retired after giving a few lectures. The chair was next filled by JUSSIEU, whose name is familiar to all botanists. One of his assistants was SEBASTIAN VAILLANT, who is supposed to have anticipated many of the discoveries which gained fame for LINNÆUS. He died in 1722. It is not necessary for us to attempt a continuous history of the gardens. The appointment of BUFFON is, however, too important an event to be passed over in the most cursory account of the institution. When, in 1739, he obtained the direction of the gardens in consequence of the dying request of M. DU FAY, the intendant, he was no more known as a naturalist than was CHRISTOPHER WREN as an architect. Both were students of mathematics and physical science, but had not applied their abilities to one class of objects. What WREN did for architecture was equalled by BUFFON'S success in creating interest in natural history. Under his guidance a new era in the history of the Jardin des Plantes was commenced. He employed his remarkable powers of persuasion to obtain the funds required for increasing the collections, and for the erection of buildings in which they could be properly displayed. He arranged for the public exhibition of all the collections. He had avenues planted, and the grounds were laid out in more artistic style. In his dealings with professors and officers he was most generous. In 1749 BUFFON began the publication of his "Histoire Naturelle," which was destined to fill thirty-six large volumes. It cannot be considered scientific in the modern sense of the word, but the remarkable eloquence compelled people to cultivate an interest in the study. The Jardin des Plantes became a fashionable resort, and it was necessary to assign to DAUBENTON, the naturalist, the duty of attending in the galleries in order that he might answer all the inquiries of the visitors concerning the objects in the collections. The reputation of the place was extended, and from many parts of the world presents for the museums were despatched. There was a danger that the original objects of the gardens would be ignored. An anatomical collection was presented by the Academy of Sciences, the King of POLAND despatched a collection of minerals, the Emperor of RUSSIA gave skeletons of rare animals found in the northern regions, and French missionaries in China contributed the most interesting objects they could obtain. In the last century it was impossible for BUFFON to attain a knowledge of the relations between organised beings. His ambition was not unlike the showman's. He was eager to captivate the attention of the public, and knew he would be most successful by presenting things that were novel and strange. At that time much was sacrificed which, in our day, would be considered as invaluable. When collections were obtained, they were sifted, and what appeared to be most surprising was alone exhibited. The remainder was destroyed or left to moulder, for space was limited, and it was not easy to accommodate anything that was not attractive. With all his defects, it cannot be denied that BUFFON succeeded beyond his predecessors in gaining admiration for his charge. A more exact method was not likely to succeed in that age. BUFFON'S name threw a sort of halo over the collections, for it was considered he was the most philosophic as well as the most eloquent of naturalists. When he died, in 1788, the Marquis of BELLARDIÈRE was appointed chief intendant; but, as France was then on the eve of revolution, his tenure of office was brief. The Constituent Assembly was not likely to regard with favour a garden which was designated as royal. An inquiry into the expenditure was ordered, and it was found that the annual expenditure was about 90,000 francs, which was not

a large sum to pay a staff of professors, officers and workmen. It was, therefore, decided that the intendant's salary must be reduced from 12,000 to 8,000 francs, that several offices were to be suppressed and economy to be sought after in all branches.

It required some courage to undertake a responsible office under the authorities of that stormy time, when the slightest error might be made out high treason. The gentle BERNARDIN SAINT PIERRE, the author of "Paul and Virginia" and the "Indian Cottage," was in 1792 thrust into the directorship. That dreamer, who appeared out of place in France and out of time, was soon by accident enabled to transform the character of the garden. Attached to the palace of Versailles was a menagerie, and after the king's execution the animals were in danger of being starved or shot. They were offered to SAINT PIERRE, but he had no dwelling-places for wild beasts. He courageously addressed a letter to the Government, and advised the setting-up of a menagerie. The police had also seized on three travelling menageries, and it was proposed to utilise them for the edification of the public. After a deliberation that was far longer than those which concerned the taking up arms against the rest of Europe, it was decided that living animals as well as skeletons should be seen in the Jardin des Plantes.

In spite of that conclusion, there was more than a possibility of the dispersion of all the collections. Orders were given that institutions for imparting knowledge which was supposed to be obsolete and dangerous to the Republic should be abolished, and the gardens were by some people considered to be as favourable to royalty as the university; but when it was explained that medicines were derived from the beds and hothouses, while the laboratory provided saltpetre, they were spared. By one of those freaks or reactions which were common at that time, the enemies of the gardens suddenly resolved that the collections should be preserved, and that the establishment should be enlarged. A library was to be set up, to which all books on natural history in the public collections were to be transferred, as well as the duplicate copies in the Bibliothèque Nationale. Twelve courses of public lectures were to be given, the subjects being mineralogy, chemistry, applied chemistry, botany, rural botany, agriculture, zoology (two courses), human anatomy, comparative anatomy, iconography. The last subject suggests that the gardens and collections were turned to account by artists as well as students of the sciences. Among the professors selected for the courses we find some who were celebrated, such as FOURCROY, the chemist; LAMARCK, whose doctrines about the variety of beings have the same tendency as DARWIN'S; PORTAL, the author of the "History of Anatomy"; FAUJAS DE SAINT FOND, the earliest investigator of volcanic phenomena; DESFONTAINES, the author of "Flora Atlantica"; LACÉPÈDE, who was entrusted by BUFFON with the continuation of his "History."

On paper the professorial staff and the affairs of the garden appeared most satisfactory; in reality little could be accomplished. For the war every available *sou* had to be secured, and there was no money to pay salaries or to purchase plants. Precious collections were sent to the gardens, but as the buildings were not dry they could not be removed from the cases. The unfortunate animals were kept on short commons, and some became very ferocious. The professors and officers appealed for aid to keep up the gardens, but the Government were without funds. The financial difficulties were so pressing that an order had to be given authorising the destruction of some animals to provide food for the others.

The attainment of supreme power by BONAPARTE was again for the gardens. CHAPTAL, who was appointed Minister of the Interior in 1800, had been a professor of "chimie végétale" at the Polytechnic School, as well as director of the powder factory at Grenelle. He was competent to realise the utility of the gardens and collections, and endeavoured to improve them. LUCIEN BONAPARTE, when Minister, had decided on the appointment of a controller of the place, who would have the sole responsibility and privilege of corresponding with the Government. The professors, on the other hand, considered that every department must have a responsible director, as it was impossible for one man to understand all

that the collections represented. CHAPTAL adopted the professors' views. He approved also of FOURCROY'S proposal, that illustrated memoirs should be issued regularly, recording the results of the investigations which were conducted in the gardens, an enterprise which was cordially welcomed by lovers of science everywhere. The additions to the collections were valuable. For the collection of minerals formed by WEISS 150,000 francs were paid, a large sum in those days. Foreign States were eager to show their appreciation of BONAPARTE by sending presents to the gardens. Exploring expeditions were sent to distant places to collect specimens. ALEXANDER HUMBOLDT at one time gave plants of 5,600 species, which he had derived from South America. The CUVIERS increased the importance of the collection by explaining the difference between fossil remains and living animals and plants. As long as the Emperor held dominion, the Jardin des Plantes flourished, and by spoliation as well as by purchases and presents the collections surpassed all others. But as NAPOLEON'S power waned the gardens proportionately suffered. The money assigned to conservation and extension was diminished, and owing to the demand for conscripts the students were much reduced in number. On the entry of the Allies in 1814 the gardens were assigned to the Prussian troops, and it must be recorded that not the least injury to any object was inflicted. In the following year, when Paris was again in their power, it was apprehended that the collections must be dispersed, for the spoils taken from foreign museums were reclaimed. It was, however, admitted that natural science was more likely to be served by leaving the collections complete, and the diplomatists and savants agreed to a compromise. As a rule only historic objects, such as precious stones which were taken from the Vatican, and objects which were the property of private individuals, were returned. The Emperor of AUSTRIA, after examining the gardens, sent plants which were needed from his own garden, and he found several imitators. On the whole, the establishment did not suffer by the downfall of the Empire. The gardens were visited by Sir WALTER SCOTT at that period, and he gives an interesting account of them in his Letters, which is applicable to-day. In one he writes:—

I know that nothing in Paris would delight you more than the Jardin des Plantes. This grand botanical garden, of several acres extent, richly stocked with the most varied and curious productions of the vegetable world, is equally interesting to the scientific student and to the idler, who seeks only for shaded walks and interesting and beautiful points of view. The variety of the ground, the disposition of the trees, and the neighbourhood of the Seine, afford the last in considerable variety; while the shade, so grateful in this warm climate, is secured by many a long alley and avenue. The establishment is maintained entirely at the expense of the public. The learned in physics may here have the advantage of a chemical laboratory, of lectures upon botany and natural history by men of approved science, of an anatomical collection and valuable library, composed of works relative to natural history. There is also a menagerie upon a great scale of splendour, as well as of comfort to the animals with which it is tenanted.

The succeeding Governments of France were compelled to keep the establishments on the level that was attained under the Empire. In 1830 we read of a vote of 90,000*l.* to construct new galleries for mineralogy, geology and botany. Land for extensions was also acquired from time to time, additional professorships and studentships were founded, and the aim was to make the collections become illustrative of the advances in science.

At the present time the Jardin des Plantes may still be considered unrivalled as a museum of natural history. For students of botany it is invaluable. The gardens are wisely laid out to suit the needs of students, and on that account strangers are sometimes disappointed, because parts are not picturesque. It is in the museums, however, that the botanical wealth is most apparent. There are innumerable preserved specimens of the flora of all parts of the world. Some are arranged to exhibit the vegetation of different countries, and may be said to have a geographical basis. Others exemplify the theories of famous botanists, and thus possess historical interest. All of them reveal the variety which nature presents, and they exercise so much fascination, we need not wonder that French designers so constantly seek inspiration in the galleries of the Jardin des Plantes.

THE ROYAL SCHOOL OF ART NEEDLEWORK.

ON Wednesday H.R.H. Princess Christian presided at a meeting at the Imperial Institute in support of the Royal School of Art Needlework. The Princess briefly explained the scope of the scheme, and invited Mrs. Dunlop Hopkins to give the meeting an account of a similar school which she successfully founded two years ago in New York City.

Mrs. Hopkins stated that the New York school had already attained three objects. In the first place it offered remunerative employment to women; secondly, it supplied manufacturers with trade designs; and in the third place it was self-supporting. She collected 2,000*l.* to found the school, but the experiment was so successful from the first that she was able to return three-fourths of this sum to the subscribers. There was a balance in hand at the end of the first year's working, and that balance had since been increased. The fee was 10*l.* a year, and there were now 300 students receiving instruction. Work completed in the school had been sent to three exhibitions, and at the World's Fair the students received five gold medals and four diplomas. She described the course of study pursued, dwelling particularly on the importance of that in historic ornament, to which in America students devoted two years or more. At South Kensington there was a similar course, but it was not carried far enough. The instructors of the New York school were the paid designers of the great manufacturers of the city, men who were actually engaged in the factories, and what was wanted in England was a practical ornamental school of design taught by similar instructors.

Thanks were afterwards tendered to Princess Christian and Mrs. Hopkins.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. Macvicar Anderson, president, in the chair.

The PRESIDENT announced that the Council had nominated Sir Frederick Leighton as recipient of the Royal Gold Medal.

The PRESIDENT moved that sanction should be given to the Council to lodge a petition against the Bill the County Council proposed to promote in Parliament in regard to London streets and buildings. He said the Council did not intend to oppose the Bill, but they wished to have a *locus standi*, so as to appear before any select or other committee in Parliament to oppose some details of the Bill which they considered objectionable, and therefore could not agree to.

Mr. TAVERNOR PERRY asked the President if his motion required seconding.

The PRESIDENT said Mr. Perry could second the motion if he liked.

Mr. TAVERNOR PERRY said he would then move that the matter be referred to a special or other meeting of the general body of the Institute, in order to give the Fellows an opportunity of considering the matter and instructing their delegates as to action to be taken before the select committee.

Professor KERR next rose, but the President intervened, saying that the business of the evening was somewhat long, and asked the members to pass his motion.

Mr. WOODTHORPE spoke in support of Mr. Perry's motion, and referred to a report of the Standing Committee, published in the "Journal," which showed that the committee had quite misunderstood the matter.

Mr. FOWLER followed with some remarks.

The PRESIDENT said the matter might be left in the hands of the Council.

Mr. PAYNE said the Fellows of the Institute would evidently have no voice in the matter if the President had his wish.

Other speakers followed.

Professor KERR then said he would second the motion of the President, and the motion was put and carried.

Professor KERR then called attention to the motion of Mr. Perry, which, as he had previously tried to explain, was not to be considered an amendment, but a motion.

The motion of Mr. Tavernor Perry, to the effect that a meeting of the Institute should be convened to discuss the Bill, having been duly seconded, was put by the President to the meeting and carried.

Mosaics and Frescoes.

Mr. HARRISON TOWNSEND read a short paper. He alluded to the high position that England held in regard to decorative and art productions, our reputation for such being acknowledged by other countries. Principles were studied, and craftsmen had loyally carried out the conditions of their art. They had not depended on sensational effects, but had worked under necessary limitations, applying the principles of their art with conscience. Mosaic was used for construction of decorative design by aid of small cubes or tesserae. Mr. Townsend then described different processes and compositions employed

for bedding the tesserae, also the methods of execution of mosaic work, and among these alluded to a not uncommon method of gumming the tesserae upside down on to paper, and then reversing them set in pozzolana cement. Gold tints and colouring he described, saying that a multitude of tints should not be worked from; a box of thirty tints was quite enough. Working in mosaic certain conditions were imposed on the artist, which he alluded to. Joints, for instance, should play their part in the design. Aerial and atmospheric effects were to be avoided. The work should not be smoothed down to one dead level. Impressionism, he also said, was what should be aimed at. He described a treatment in monochrome he said he had carried out in a church, his method of obtaining a certain amount of flat surface for ceiling-decoration, for production of life-sized figures, and the method of execution; the preparation of the plaster-work, rough-rendered plaster serving as the basis, and also the uses of various chemical washes, and fixing solutions which atmospheric conditions or acids could not affect.

Mr. POWELL confined himself to wall and roof decoration in glass mosaic, as he did not propose to speak of floor work or of marble mosaic. He described different materials used for glass mosaic and methods of colouring and chemicals and metals used for producing different colours, processes for glass enamel, and the conditions when plain or fractured-surfaced tesserae should be employed. He mentioned the processes for making the gold tesserae, silver being made in a similar manner. Examples of gold work so made he traced back to the fourth century. Earlier work of the third century found in the catacombs showed that the Romans employed gold in mosaic work. He alluded to different methods of working for curved surfaces and the preparation of models for it, in contradistinction to working on the flat. He several times referred to the mosaic work carried out in St. Paul's Cathedral. He also favoured the plan of working *in situ* rather than executing the work in the studio. Time was saved by the former plan, and the dead level appearance of the second plan avoided. He concluded by some suggestions which he considered required attention if mosaic work were to flourish in this country, and among these suggestions an important one was to design according to the distance the work would have to be viewed by the eye.

A paper by Mr. Salviati was read by the manager to the firm. He said mosaics might be divided into two classes, mosaic work for marqueterie, brooches, table-tops, &c., and the monumental or Byzantine kind, best fitted for architectural decoration. A short review of the rise and development of mosaic was made, the successive steps towards improvement described, and the materials and processes for making enamels mentioned. The author of the paper also alluded to his father's, Dr. Salviati's work, and his efforts to establish schools of training for workers; also to Dr. Salviati's systems of work, methods which he pronounced as most simple and least costly, the process of manufacture being also so quick. The paper concluded by calling attention to the excellent condition of the mosaic work on the Albert Memorial.

Mr. Westlake's paper was read by Mr. Carøe. Mr. Westlake proposed the following questions:—Whether mosaic and fresco works could be revived here; if they could, would they be suitable here; and thirdly, whether our modern methods would not be the best, especially in regard to climate. The modern mosaic work in Russia and France was alluded to, and mosaic work and fresco work considered from the æsthetic point of view. There was no real school of fresco here, neither did he think there was here anything that could be called patronage of it. He was inclined himself to favour the modern methods as regarded mosaic and fresco work.

A vote of thanks was passed by acclamation to the authors and readers of the papers.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the meeting of this Association, Mr. W. W. Robertson, president, in the chair, Mr. J. M. Gray, F.S.A. Scot., curator of the Scottish National Portrait Gallery, read a paper on "Engraving on Metal: its Technical Processes and Artistic Results." After remarking upon the pleasure to be derived from a study of the *technique* of the various processes of art, from a perception of the adaptation of the artist's method to the object which he had in view, the lecturer considered in detail the various processes of engraving on metal and the artistic results which they yielded. The method of line-engraving Mr. Gray styled as *par excellence* the classic mode of engraving, and stated that its highest function lay in translating into black and white by the most careful, finished and accomplished method, the great masterpieces of the painter's art. It was noticed that the early line-engravers were original artists who reproduced their own designs, and special reference was made to the plates engraved by Martin Schongauer, Van Mechlin, Albert Dürer and Lucas van Leyden. In Marc

Antonio they had, however, an early engraver who devoted himself to reproducing another artist's work—the designs, namely, of Raphael. The line-engravers of France and Holland of the seventeenth and eighteenth centuries, and the great school of English line-engravers who reproduced the landscapes of Turner were dealt with, and the technical processes of etching were explained. Etching, he said, was pre-eminently a process for sketches in which the line should be used with the finest selection and be as expressive as possible. Rembrandt was instanced as the great master-etcher, and reference was made to the modern revival of etching as an artistic process in France and England, and to the work of such etchers as Meryon, Flameng, Whistler and Haden. The lecturer stated that the most typical dry point was one rendering vivid and telling contrasts of light and shade, his remarks being illustrated by a reference to plates by Legros, Geddes and Wilkie. Mezzotint was the last method with which the lecturer dealt, a process fitted for realising perfect tonality, and as it worked by spaces, not lines, for rendering the breadth of effect that is attained by the painter's brush. Reference was made to the magnificent renderings of Reynolds's portraits by this process, and to its use by Turner and Constable in reproducing their landscapes.

THE PHŒNICIAN RELICS AT THE BRITISH MUSEUM.

A REARRANGEMENT of great importance has just been made in the British Museum of the valuable historical monuments of the ancient Phœnician peoples which that institution possesses. The second Northern Gallery, which has the inestimable advantage of good overhead lighting, has been devoted to their display, says the *Standard*, and will be a treasure-house for popular instruction when the addition of a concise descriptive guide-book has been published.

In the wall cases on the landing of the north-west staircase before entering this gallery are a considerable series of sculptures and inscriptions, chiefly from excavations at Idalion, in Cyprus, in 1870, by the British consul, Mr. R. Hamilton Lang. The order of their arrangement is on a chronological basis, and they illustrate the Archaic and Hellenistic periods of Cyprian art from about 650 B.C. to 150 B.C. Amongst the most interesting of these objects are numerous heads of the Tyrian Hercules; a marble slab with bilingual Phœnician and Cyprian inscriptions made by Baalramus, son of Ebed-Melek, in honour of the god Resel-Mikal; a group of figures for a tomb, and a limestone stele with bilingual inscriptions, in Greek and Phœnician, of Artemidorus of Sidon. The first room is devoted to Cyprian antiquities, mainly of small sculptures and terra-cottas, showing the effects of Egyptian, Assyrian and Greek influences upon Egyptian art. There are also bilingual Cyprian and Phœnician inscriptions of historical and philological importance, some belonging to the Archaic period and others to the Hellenistic. In the centre of the room is an alabaster monument, from Larnaca, of Sardalus, son of Ebed-Melkarth, grandson of Resefyathan, in honour of his god Eshmun, about 380 B.C.

The second room contains monuments from Phœnicia, or ancient Canaan—the lowland of Palestine—Carthage and Cyprus, as well as from Palmyra and Arabia. The land occupied in very early times by the Phœnicians or Canaanites extended from Lebanon on the north to the Dead Sea on the south, from the river Jordan on the east to the Mediterranean on the west. These ancient inhabitants were probably immigrants, Strabo thinks, from the islands of the Persian Gulf. As early as the time of Abraham there was a settlement on the plain at the foot of the mountains of Lebanon. Herodotus says that the Temple of Hercules, in Tyre, had existed for twenty-three centuries. About 1300 B.C. the Israelites, led by Joshua, invaded the country, and driving the inhabitants from the interior, restricted their occupation to the narrow tracts of coast between Aradus and Askalon. This position, however, gave them the command of the Eastern Mediterranean Sea, and they thus maintained their vast trade with the ancient world. Their chief cities were Tyre and Sidon, both settlements of high antiquity. Their “new city,” Carthage, dates from very many centuries before Christ. In all parts of the earth traces of the Phœnicians remain. Their language is closely allied to the Hebrew, and it has given birth to the Greek and Latin, and eventually the modern European languages. The oldest Phœnician inscription known is that of Mesha, King of Moab, 900 B.C. Amongst the chief objects in this second room is a cast of the Phœnician inscription on the celebrated Moabite Stone, presented by the Museum of the Louvre. This stone was discovered by the Rev. F. Klein, at Dibhan, in August 1868. It is 3 feet 10 inches high, 2 feet in breadth and 14½ inches in thickness. It will be remembered that the Arabs resented its removal, and, after vainly attempting to smash it with hammers, heated it by fire and splintered it into fragments by pouring vinegar on the hot mass. The restoration has been effected through a paper cast previously taken—28 of the frag-

ments of the original having been secured. The inscription consists of 44 lines. Its date is 900 B.C., and it gives account of the war of Mesha, King of Moab, against Omri-Ahab and other kings of Israel. The Moabites were surprised by the Jewish league, and mercilessly routed from city to city until Kir-hareseth. Here, with 700 men who drew swords, King Mesha made a vigorous onslaught upon the King of Edom, but was repulsed. After this he publicly sacrificed his eldest son upon the city wall, in view of the invaders. His troops fighting with fresh courage drove back the victorious armies of the allied Israelite kings. Mesha restored Korchah and its gates, towers, palace, reservoirs, and rebuilt other places, and made a road over the river Arnon. He set up this monument at Kermost; and it is very instructive to compare this inscribed narrative with various passages in the Jewish Book of Kings.

Another monument of interest is the inscription which was cut from the wall of the conduit which filled the Pool of Siloam. It states that the excavators met in the middle of the tunnel, and at 3 cubits apart they worked towards each other by the sound of their picks. The water flowed through from a spring 1,200 cubits away. In the inscription of the sarcophagus of Eshmun-Azar, King of Sidon, B.C. 350, he complains of dying before his time, and forbids men to search his tomb for treasure, for there is none; or to remove his tomb; or to build anything over it. The inscription further states that he, the son of Tabnith, King of Sidon, and Queen Ammestoreth, his mother, the priestess of Ashtoreth, built the Temple of Ashtoreth and Astarte in Sidon, the Temple of Eshmun, the Sacred Grove of Enfidal in the mountain, the Temple of Baal at Sidon, and that of Astarte-Shem-Baal. He, the Lord of Kings, bought at great price the most excellent land of Dir and Joppa, in the territory of Shatan, and joined it to the borders of Sidon for ever. Amongst the other relics of note are the inscription from the Temple of Juno at Carthage; casts of Hebrew square characters from the so-called “Tomb of St. James,” in the Valley of Jehoshaphat; busts from Palmyra—the ancient Todmor built by King Solomon. There is an important series of tombstones, and on the centre tables of the room are seals, scarabs, and other articles engraved with Phœnician devices and inscriptions—many probably the work of engravers settled in Egypt—the period of work extending from 700 to 100 B.C.

GLOUCESTER CATHEDRAL.

TWO years ago, in response to an appeal by the Dean and Chapter, the sum of 6,000*l.* was subscribed for the restoration of the fabric of Gloucester Cathedral. With this money the Norman turret of the south transept has been repaired; the bells have been readjusted and rehung, repaired and strengthened; the south ambulatory of the choir has been repaired as regards roofs, walls, parapets and windows; the north ambulatory is nearly finished; two of the large south windows of the lady chapel have been repaired and reglazed, and other windows restored; the parapets and pinnacles are completed and the roof strengthened. The famous chimes have been renewed and the quaint tunes properly set. A special appeal is now made for the necessary restoration of the lady chapel, and a sum of 650*l.* is already forthcoming. The Dean and Chapter urge that the work of restoration in connection with the lady chapel should be proceeded with as quickly as possible, especially the external parts and the glazing of the windows. The structure has fallen into a shocking state of decay. At present the wet gets in everywhere. The sum of 4,150*l.* is named in the architect's report for the necessary works. It is hoped that the lady chapel may be so repaired and fitted up that it may be used for Divine service, it having been disused for over forty years.

ROMAN ROCHESTER.

DURING the excavations carried out in connection with the rebuilding of Sir Joseph Williamson's Mathematical School at Rochester an interesting archaeological discovery was made. It was found that the Saxon work of the old city wall and Eastgate Tower rested on Roman foundations, and during the progress of the operations Roman remains were opened up to a considerable extent. The Rochester Town Council have now taken steps to preserve for public inspection these interesting works of the Roman and Saxon periods of the history of their ancient city. A strong desire was manifested to continue the investigations and to further open up Roman Rochester, but the Corporation came to the conclusion that they could not fairly and legitimately devote the money of the ratepayers to this purpose. Therefore, whilst they are doing all that is necessary to maintain access to the Eastgate Tower and the other ancient relics, the Corporation have decided to leave any future researches to antiquarian and kindred societies.

TESSERÆ.**Gerrard's Hall, London.**

IT has been too much and too long the custom to view the manners and habits of remote times through a medium highly tinged with the results and conveniences of modern life, and therefore they have been seen under a false aspect: it is only by looking carefully into the dry schedules of the household effects of our remote ancestors, and taking the number of their pots and pans, their beds and tables and other domestic goods, that we can be enabled to judge how meanly they were lodged and how far from luxurious their daily modes of life must necessarily have been. Thus we see in London, as in other towns that are old, the lower storey of the house was usually half underground and almost invariably vaulted over, and this when the superstructure was of wood. It was, indeed, the most common arrangement to have the lower storey only of stone and vaulted, and the upper part of wood. These lower apartments served as store-rooms or warehouses for valuable goods, or for cellars only, according to circumstances. In the decayed town of Winchelsea many of these vaulted chambers remain perfect, although the timber houses which were originally built upon them have entirely disappeared, or have been rebuilt. There are many traces of these vaulted chambers also in London. The fine room in the building, commonly known by the name of Gerrard's Hall, was, in fact, a merchant's warehouse of this kind, and not strictly speaking a hall; that is to say, it was never the hall or living room of the house. It had no fireplace in it and no place for a hearth in the centre, and the manner in which the original staircase descended into it clearly showed that it was always half underground. It was an excellent example of the lower storey of a large merchant's house of this period, but the hall was over this and was apparently of timber, with the gable ends only of stone; these were partly standing in May, 1852. The room called the hall would more properly have been called the cellar, and though a fine room for that purpose, scarcely finer than the cellar of the bishop's palace at Norwich, and other examples, both English and French. It was evidently the lower storey or cellar of the house of a wealthy merchant of the time of Edward I. It was an oblong room vaulted in two parallel divisions, with a range of arches between them, carried on rather slender round pillars, with moulded capitals and bases of early decorated work. The shell of the vault was of small ashlar-work of hard chalk, with ribs on the groins and longitudinal; the ribs had hollow chamfers but no bosses. Its dimensions were 42 feet long by 21 feet wide. The entrance was by a flight of stone steps in one corner, carried upon a half-arch, part of the original work. At the opposite end of the hall was a small doorway opening into a passage in the thickness of the wall, in which there had been a staircase.

The Chandos Portrait of Shakespeare.

This picture has for many years been known as "The Chandos Portrait of Shakespeare." It came into possession of the family of the Duke of Buckingham from Mr. Nicholl, of Minchenden House, Southgate, whose daughter married the Duke of Chandos, who was father of Anna Eliza, Duchess of Buckingham. It is presumed to have been the work of Richard Burbadge, the actor, who originally represented most of the great tragic parts in Shakespeare's plays. Burbadge is known to have had considerable skill in painting, and left behind him, amongst other pictures, his own portrait—still preserved at Dulwich College. Those who compare the Chandos portrait of Shakespeare with the Dulwich portrait of Burbadge will not fail to remark proofs of similarity of style and treatment. Joseph Taylor, the actor, who outlived Burbadge many years, is stated to have been the next owner of the picture, and it has been added that "he left it by will to Sir William Davenant"; but as no will by Taylor has been discovered, and as he was very poor in the later period of his life, it seems much more probable that Davenant obtained it by purchase. There is no doubt that the picture once belonged to Davenant, who, having been born in 1605, died in 1668. If he never saw Shakespeare himself, he knew many who had lived in the greatest familiarity with him, and who must have been acquainted with every feature of his face and with every turn of his expression. It is quite certain also that Sir Godfrey Kneller made a copy of the portrait and gave it to Dryden, for Dryden states it in the verses he sent to the painter in return for the present. Dryden was thirty-seven years old when Davenant died, and must often have heard him speak of Shakespeare and of this portrait. Thomas Betterton, who may be called the last performer of the school of Shakespeare, is said to have bought the picture at Davenant's death; it was therefore Betterton's property when Kneller copied it for Dryden, because Kneller did not visit England until 1674. Davenant would not have prized it, Betterton bought it and Kneller copied it, if the resemblance to Shakespeare had not been accurate. Its resemblance to the engraving on the title-page of the first folio, which must have been selected by Heminge and Condell on

account of the likeness, to which Ben Jonson bears direct testimony, is apparent. The only material differences are the earring, which was not inserted, and the dress, which in Martin Droeshout's engraving is more ornamental and elaborate. The copy made by Kneller for Dryden devolved into the hands of the Earl of Fitzwilliam; and such was the estimation in which the original was held at later periods, that a painting was made from it by Sir Joshua Reynolds for Bishop Newton in 1760. An anonymous copy was presented by Capell to Trinity College, Cambridge, in 1798; and Malone engaged Ozias Humphry to make a drawing of it in crayons in 1783, which is now in the collection of the Garrick Club. Ramberg and several artists employed by engravers also imitated it, but generally with little skill and less fidelity; the enamel by the elder Bone is, however, a beautiful specimen of art. The original passed from Betterton to Mrs. Barry, the famous actress. She sold it to Mr. Robert Keck, of the Temple, for forty guineas, and from him it came to Mr. Nicholl. It afterwards went, as already stated, to Stowe, and at the sale of the Duke of Buckingham's effects in September 1848, it was bought by the Earl of Ellesmere for 355 guineas. Lord Chancellor Ellesmere was acquainted with Shakespeare, and, by an appropriate coincidence, a possessor of the title became the possessor of the portrait. It is painted on canvas and is 22 inches high by 17 inches wide.

Types in Painting and Sculpture.

The qualities which constitute the elements of the formative arts may be reduced to form, colour and light as exhibited in the organic and inorganic world. Of these, form may be said to comprehend the most definite and universally applicable principles, and therefore claims our attention first. The definition of any given fact in the outward world in its relation to the sense of sight is arrived at when that assemblage of qualities which constitutes its distinctness from all other facts is made intelligible. The definition of visible characteristics with this view is accomplished in a great degree by the comparative anatomist, the botanist, and other votaries of science. Such investigators may consequently render more or less service to the artist. But the paths of the two classes of inquirers soon diverge. To the painter such researches are not an end, but a means. On the one hand, his attention is invited by the infinite variety of nature no less than by her order and method, and on the other, his selection of distinguishing facts has a wider application than the mere purpose of recognition or the mere fidelity of representation. He regards the prominent characteristics of objects not as isolated details, but rather in the arrangements and relations. When, therefore, we here speak of characteristic qualities in reference to the productions of nature it is always to be understood that the term comprehends the idea of a whole, and that the prominent qualities are supposed to be considered in their relation to the general appearance. This mode of observation may indeed be considered common to the zoologist and to the artist, but the latter in one sense goes further. What may be called the representation or archetypal form in animals is arrived at not merely by comparing individuals of the same species together, but by comparing them with other creatures, which decidedly but not radically differ from them. There can be little doubt that this was the principle which enabled the Greeks so constantly to arrest the great characteristics of human beauty. Their process in this respect is more especially evident in their representations of what were called divinities. Making every allowance for the powers of gifted artists and the excellence of models, the supernatural yet beautiful treatment of the human form, which some of the finest antique statues present, is only to be explained on the principle above noticed. That form, as the most complete development of its class, can only be so elevated by departing (as far as the verge of possible, or rather conceivable, nature warrants) from the characteristics of inferior animals. It can be so elevated with perfect success, because it is the only instance in which an animal may slightly overpass its own characteristics without encroaching on or too closely resembling those of another.

Roubiliac's Agreements.

The following copy of an agreement is evidence of the care taken by the French sculptor—whose thoughts were said to be conceits and his compositions epigrams—to avoid misunderstandings between himself and his clients in England:—An agreement made the 18th day of April, in the year of our Lord one thousand seven hundred and fifty-nine, between Louis Francis Roubiliac, of St. Martin's Lane, in the parish of St. Martin-in-the-Fields, in the county of Middlesex, statuary, of the one part, and Ann Lynn, of Southwick, in the county of Northampton, widow, of the other part, as follows:—That is to say, that the said Louis Francis Roubiliac, in consideration of the sum of two hundred pounds of good and lawful money of Great Britain to him the said Louis Francis Roubiliac in hand paid at or before the sealing and delivery hereof by the said Ann Lynn, and the receipt whereof is hereby acknowledged

and of the further sum of three hundred pounds of like lawful money to be paid to the said Louis Francis Roubiliac, his executors or administrators, by the said Ann Lynn, her executors or administrators, when the monument hereafter mentioned shall be completed, doth hereby for himself, his executors and administrators, covenant and agree to and with the said Ann Lynn, her executors and administrators, that he the said Louis Francis Roubiliac shall and will make, erect, and set up in and upon the ground purchased by the said Ann Lynn in the parish church of Southwick aforesaid for that purpose a marble monument to the memory of George Lynn, the breadth whereof to be at least seven feet and the height thereof to be at least fourteen feet, and complete the same in a good and workmanlike manner according to a plan drawn thereof, agreed to and signed by the said Louis Francis Roubiliac and the said Ann Lynn: the choice of the colours and quality of the marble for erecting the said monument to be left to the discretion of the said Louis Francis Roubiliac. And the said Ann Lynn for herself, her executors and administrators, in consideration of the above agreement, to be performed by the said Louis Francis Roubiliac, his executors or administrators, doth hereby agree to pay or cause to be paid unto the said Louis Francis Roubiliac, his executors or administrators, the said further sum of three hundred pounds when the said monument shall be so erected and completed according to the said plan thereof. And further, that it is mutually agreed upon by and between the said parties that the said Ann Lynn, her executors and administrators, shall not be liable to pay or be at any further expense above the said sum of five hundred pounds for or on account of engraving or cutting the inscription upon the said monument, packing-cases, carriage of the same, putting up, and iron rails round the said monument, parish fees, and anything done to the foundation where the said monument is to be erected—mending or alterations in the church wall on account of erecting the said monument excepted.—In witness whereof the said parties have hereunto interchangeably set their hands and seals the day and year first above written.

Myths and Greek Art.

A general history of mythic tradition can only result from the separate investigation of the individual myths—it is the sum of these biographies. Many of them we cannot trace to any intelligible origin. The cumbrous learning of the last century failed to prove their derivation from exotic or from esoteric sources—the ingenious sagacity of German criticism will scarcely divine how and when they were first engendered. Each myth is a separate thread—the whole system an intricate network. We cannot subject it to a strict anatomy, lay bare its tissues and trace each fibre to its insertion, but it is possible to learn something of the organic laws as well as of the external circumstances which have influenced its growth. It is possible to compare the popularity of myths by noting the relative frequency of their recurrence in art and literature; to arrange their varieties locally, and in many cases chronologically, and to note the successive predominance of special influences in causing these varieties. With what success such a method of inquiry can be applied to mythology has been shown in the masterly dissertation in Grote's "History of Greece," how it can be further carried out in mythography it is the province of the archæologist to show. His part in the division of labour is to arrange the monuments of Greek art now extant as far as possible in chronological sequence and in geographical relation, and then on the base of this arrangement to enter on the mythical subjects which they represent. His task will then be one of interpretation. He must seek out the motive of each composition, the names and attributes of the beings represented by each figure or symbol. He must gradually master every phrase and idiom of the language of ancient art. He must read the expression of the mental qualities in the external form, he must appreciate that fine delineation of character which the ancients called ethnography. Having acquired the intuitive sagacity which at once recognises mythical affinities and distinctions, he will follow the history of the types by the aid of his chronological and geographical data. Art will be his guide to pursue the myth through all its windings and interpenetrations, its evasions and subterfuges—as his eye pierces through its Protean disguises, his mind will learn to analyse and decompose its subtle combinations. He will discern under the poetic or sculptural garb of the myth the traces of its more ancient hieratic form, half obliterated like the original text of a palimpsest. He will separate off from the primary idea such peculiarities of treatment as are the result of the conditions of art; he will distinguish the purely religious symbol from accessories chosen as a means of expression by the sculptor. He will detect the presence of an exotic element in the myth, and point out the probable sources whence it was derived. He will show how the streams of tradition flowing onward for a time in separate channels had a natural tendency to confluence as time and conquest broke down the barriers which

divided races—how, as the types of the earlier paganism were thus fused and blended, the language of art, expanding with these new ideas, became not figurative merely but transfigurative, more copious but more obscure, full of the barbarous corruptions of a pantheistic age.

Runic Memorials.

From ancient time poetry was highly esteemed and generally cultivated in the North. The mightiest kings and chiefs regarded it as a great honour to be praised by the songs of the bards or skjalds. A chief characteristic of the Danes and their northern kinsmen was a thirst for glory in this life, an honourable name after death, and above all, a high veneration for the gods. It was therefore a common custom to erect runic stones on the graves of well-known men and women. In several runic inscriptions in Denmark the mighty god Thor is invoked to protect the graves. His mark, the "swastika," is sometimes engraved on the stones, together with Odin's mark, the "triskele." In Norway and Sweden, but less frequently in Denmark, the graves were also adorned with high-standing "bautastones" without inscriptions. In Norway and Sweden the people continued, according to old heathen custom, to erect large barrows, in which the deceased chiefs were often buried in fully-equipped ships, with arms and ornaments, and with their favourite animals, chiefly horses and dogs, which were sacrificed to the gods at the burial feast. In certain parts of Sweden, chiefly in the island of Gotland, the images of the mighty gods were often engraved on the runic stones in honour of the deceased. On the top of the Sandastone is represented, in a special panel, the northern triad, Odin with the spear, Thor in the middle, and Frey with a large goose, which bends its neck over him. On other stones are represented Odin with his horse Sleipner, with the ravens Hugin and Munin, and the wolves Gere and Freke. The smaller graves were frequently decorated with surrounding stones, often in the shape of ships, by which doubtless not only ordinary ships were intended, but also Frey's sun-ship, *Skidbladner*, which is also represented on several runic stones in Gotland. Other low, triangular barrows, with sides curved inwards, which shape would otherwise be inexplicable, have evidently been shaped after Odin's mark, the triskele, and others again with straight sides after the triad mark, the triangle. Similar grave-mounds were also constructed in Denmark, but owing to the earlier influence of Christianity in that country they are found less frequently. Burial in ships has not yet been proved to have taken place in Denmark. A favourite burial custom in that country, and one not less imposing, was to bury the chiefs with their carriages and horses, so that they, as is told in the old Sagas, might make their entry with the gods and the Einheriars into the lofty Valhalla, either driving in their carriage or on horseback. Indeed, the carriages and horse-trappings, collar-harnesses, head-gears, bridles, stirrups, &c., which were placed in the graves plainly illustrate the peculiar richness and splendour which must have predominated in the time of the Vikings in Denmark.

Mosaic Glass-Painting.

The mosaic system of glass-painting is admirably adapted to the nature of the material. It is, however, unsuited for mere picturesque effect, owing to the nature of its colouring, which being produced by broad pieces of glass, whose tints can scarcely be varied either in the lights or shadows (the latter being represented by means of the enamel brown) imparts to works executed in this style the flat and hard, though brilliant character, of an ancient oil-painting. The revival of art in the sixteenth century, and the extraordinary effects then achieved in oil-painting, by which the hard and dry illumination of the Middle Ages was transformed into a beautiful picture, glowing with the varied tints of nature, and expressing to the eye, by a nice gradation of colouring, the relative position of near and distant objects, seem to have excited the ambition of the glass-painters. Not content with carrying mosaic glass-painting to the highest pitch of perfection it has hitherto attained, and with borrowing the excellent drawing and composition of the oil and fresco-painters, they strove to render their own art more completely an imitation of nature, and to produce in a transparent material the atmospheric and picturesque effects so successfully exhibited by the reflective surfaces of oil and fresco-paintings. The facility of applying colour to glass with the brush, at the pleasure of the artist, afforded by the discovery of the various enamel colours, about the middle of the sixteenth century, soon led to their extensive employment. It was not, however, until the eighteenth century that they entirely superseded the use of coloured glasses in large works. The introduction of enamels, though it certainly occasioned a great extension of the scale of colour in glass-painting, was not without its disadvantages. The paintings lost in transparency what they gained in variety of tint, and in proportion as their picturesque qualities were increased by the substitution of enamel colouring for coloured glass, their depth of colour sensibly diminished.

NOTES AND COMMENTS.

DEFECTIVE plans give rise to much costly litigation, and when it is remembered that the preparation of them is often entrusted to incompetent hands by solicitors, there need be no surprise at the consequences. We must confess, however, that we are amazed when we find the Corporation of London, that should set an example to men of business in all affairs, exhibiting the carelessness about plans which was revealed this week in the action about the site of Farringdon Market. The property was sold a couple of years back, and was bought by Mr. H. T. TUBBS for 98,100*l.* Attached to the descriptive particulars was a lithographed plan, which included property that could not be considered as belonging to the Corporation under the Act 5 Geo. IV. c. 151, which was the basis of their title. The extraneous portion (which was not possessed by the Corporation until 1864) formed about one-tenth of what was represented. It was one of the conditions that the purchase must be completed by June 24, 1892, and if there was any delay, unless it arose from the wilful default of the Corporation, interest at 5 per cent. was to be paid. In consequence of the duality of the titles it was not possible to make out a conveyance until September 29. The Corporation, however, insisted on the payment of three months' interest, although there could not be any doubt the delay was caused by their oversight. The case was heard before Mr. Justice CHITTY, who gave judgment in favour of the Corporation. The main ground of his lordship's decision was the clause in the conditions of sale about wilful default. It could not be supposed that the Corporation attempted any deception by issuing an incorrect plan, and a man who was not deterred by the clause is bound to abide by it. The judge also said that the purchaser could have inspected the original plans and compared them with the lithograph. With the utmost deference to his lordship, we must say that is a course which not one surveyor or solicitor in a thousand would adopt. The Corporation claimed to be possessed of a title under a special Act, and everybody was led to assume that they were about to transfer all that was comprised in that title, and not a hair's-breadth more of land. An Act of the kind is supposed to confer rights that are unquestionable. Besides, who could imagine that in so important a matter the Corporation would be at fault? The most wonderful part of the transaction is the claiming of interest for an interval when Mr. TUBBS could not be considered as purchaser, and did not enjoy the rights of an owner. Mr. Justice CHITTY's judgments will be invaluable precedents. Knowing that fact, he has to be circumspect and mindful of consequences. His lordship considered that if judgment were given against the Corporation, by considering the error to be a wilful default, it would be difficult hereafter for vendors to have the benefit of exceptions in conditions of sale. But if his lordship could treat the case by itself, we imagine his judgment would be in favour of the purchaser. The moral to be drawn from the action is that in case of sales lithograph plans are never to be trusted, unless there is a guarantee upon them that vendors will accept unrestricted responsibility for their accuracy, and that the phrase "wilful default" should always excite suspicion.

A COPY of a letter from ROBERT BURNS to PETER HILL, the Edinburgh bookseller, has been travelling from journal to journal as a discovery. It relates to the headstone which BURNS had erected at the grave of FERGUSSON, another poet, in the kirkyard of Canongate, Edinburgh, and runs as follows:—"My dear friend,—I send you by the bearer, Mr. CLARK, a particular friend of mine, six pounds and a shilling, which you will dispose of as follows: 5*l.* 10*s.*, per account, I owe to Mr. ROBERT BURN, architect, for erecting the stone over poor FERGUSSON. He was two years in erecting it after I had commissioned him for it; and I have been two years in paying him after he sent me his account; so he and I are quits. He had the *hardiesse* to ask me interest on the sum; but, considering that the money was due by one poet for putting a tombstone over another, he may, with grateful surprise, thank Heaven that ever he saw a farthing of it. My best compliments to Mrs. HILL.

I sent you a mankin by last Friday's fly, which I hope you received.—Yours most sincerely, ROBERT BURNS." As the copy is headed "Burns and the Architect," we suppose it is now assumed that BURNS was exposing an attempt at extortion by an architect. The truth is, the letter (which has been several times printed since the poet's death) is a joke. ROBERT BURN was not an architect, but a partner in the firm of J. & R. BURN, stonecutters and masons. In sending the account for the memorial, he wrote to the poet, "I shall be happy to receive orders of a like nature for as many more of your friends that have gone hence as you please." The charges were evidently at cost price, and BURN was merely humorous when he asked for interest on 5*l.* 10*s.* 6*d.*, or, in other words, did not anticipate prompt payment. In a similar spirit the poet replied. The items in the account were as follows:—"54 feet polished Craighleith stone for a headstone for ROBERT FERGUSSON, at 1*s.*, 2*l.* 14*s.*; 10 feet 8 inches double base moulding at 1*s.* 6*d.*, 16*s.*; four large iron cramps, 2*s.* 10*d.*; two stones to set the base on at 1*s.*, 2*s.*; 320 letters on ditto at 8*s.*, 1*l.* 5*s.* 8*d.*; lead and setting-up ditto, 5*s.*; gravedigger's dues, 5*s.*" If all poets could be as economically entombed there would be fewer uncertainties about the positions of the narrow houses in which they were laid at rest. Fancy being able to have a quatrain by BURNS, to say nothing of a long prose inscription composed by WILLIAM SPOTT, clerk to the managers of the kirk and kirkyard, and the usual tombstone information engraved and leaded over one's remains for 1*l.* 10*s.* 8*d.*

In Italy agriculture is the most important of occupations, for the rural labourers number as many millions as there are thousands of industrial operatives. The quarrying industry is not, however, to be despised. In 1880 the total value of the produce of Italian quarries and kilns was estimated at 85,000,000 lire, and by 1889 it had risen to about 100,000,000 lire, or 4,000,000*l.*, one-fifth of which was contributed by the marble quarries of the Alps (Massa and Carrara). In 1890, 1,089,948 tons of marble, alabaster, granite, slate and various kinds of building stone were quarried in Italy, amounting in value to 27,765,484 lire. In the same year 11,290,229 tons of limestone, sand, gravel, lava and other materials used for building and road-making were produced, of a total value of 17,488,723 lire, and also 164,139 tons of mill-stones, pumice-stone, talc and other substances used for industrial purposes, worth 2,466,103 lire. The produce of the various Italian kilns in 1890 was 5,363,932 tons, valued at 103,010,946 lire. In all, then, the total value amounted to 150,731,256 lire, and exceeded considerably that of previous years. The hours of work in quarries are generally from ten to eleven per diem; the days of work are from 230 to 300 per annum, and wages vary from 60 centimes to 5 lire a day, according to the class of workers.

Two arbitration cases relating to claims for building works against the London School Board have been determined on remarkably economical terms. A year ago Messrs. ATHERTON & LATTA issued a writ to obtain payment of 733*l.* 0*s.* 3*d.*, alleged to be due for work done under the repairs schedule. A claim was also made for interest amounting to 60*l.* on overdue accounts, and for interest at 4 per cent. per annum from the date of the writ. A tender in cash, amounting to 40*l.* 13*s.* 2*d.*, had previously been made to Messrs. ATHERTON & LATTA to settle the account, but had been refused. The matter was referred by the Master to the arbitration of Mr. H. W. D. THEOBALD. It was agreed that neither of the parties should be represented by counsel or solicitors. The arbitrator has awarded to Messrs. ATHERTON & LATTA 325*l.* 18*s.* The costs of the award amount to 28*l.* 10*s.* Another writ was issued by Mr. PRICE (trustee of Messrs. BARLOW & ROBERTS) for the balance of 149*l.* 10*s.* 5*d.*, alleged to be due for repairs. Mr. L'ANSON was appointed arbitrator, and he has awarded to Mr. PRICE the sum of 13*l.*, and has given to the Board the costs of the reference, but has directed that the costs of the award should be borne by the parties in equal shares. The costs of the award amount to 52*l.* 10*s.*

ILLUSTRATIONS.

VICTORIA ASSIZE COURTS, BIRMINGHAM.

A GENERAL view of the Birmingham Courts was published lately in this Journal. We now show on a larger scale the central block of a building that has received general commendation from the Judges who have presided in it.

CHURCH OF THE ENGLISH MARTYRS, STREATHAM HILL.

THIS church, which is being erected, has been designed by Mr. A. E. PURDIE, Talbot House, Crownhill Road, Willesden.

NEW RESIDENCE, SULHAMPTON, BERKS, FOR GENERAL HAWLEY.

THIS house has recently been erected for General HAWLEY, on high ground, the site having been planted, &c., for a house some years ago. The house is built of red brick and half timber, the tiles being dark red. The contractor was Mr. W. H. SIMONDS, and the architect Mr. GEO. W. WEBB, Market Place Chambers, Reading.

BRITANNIA RECEIVING THE HOMAGE OF THE NATIONS.

THE Freemasons' Tavern in Great Queen Street was recently decorated in a costly manner by Mr. J. M. BOEKBINDER. In the great hall, which has so many historic associations with the craft, the wall-space at one end has been adorned with a large painting, of which we give an illustration. Adopting the system introduced by M. PUVIS DE CHAVANNES, the painting suggests to some extent a piece of tapestry, and is therefore not only expressive, but restful. At a time when foreign immigration causes uneasiness among London ratepayers, Britannia cannot offer much welcome to strangers, but when they come in graceful guise as the representatives of the arts and resemble the figures in the painting, they are not likely to be sent away unsatisfied. Masonry, like nature, can make the whole world kin, and the wall-painting is not without its mystic significance.

LONDON STREETS AND BUILDINGS BILL.*

THE subject for our consideration this evening is the Bill promoted by the London County Council to consolidate and amend the law relating to building in the administrative county of London, and is entitled the London Streets and Buildings Bill.

During the year 1891 the late Government prepared a Bill which proposed to consolidate the then existing Acts, and were prepared to incorporate with it such amendments of a minor and non-contentious character as experience in the working of the present Acts had rendered desirable; this Bill had made some progress, and several public bodies had sent in various suggested amendments, among which was a rather formidable array from the London County Council, of which it could not be said that all were of a minor or non-contentious character. But a change in the Government having occurred the Bill was dropped.

The London County Council, however, being desirous of ending the present anomalous state of things, whereby a builder is compelled, if he intends to keep in the right path, to make himself acquainted with something like thirteen separate Acts of Parliament, in addition to two or three sets of by-laws, and finding that the present Government had no time to prepare a Bill, decided to introduce one of their own, which is now before us.

I must assume that my audience is more or less acquainted with the Building Acts now in force, as the limited time at my disposal this evening will not permit me to go through the whole of the Bill, but only to touch on those points which differ from or amend the existing enactments. As to the necessity for consolidation only, I take it there can be no doubt, but it is only on the amendments that differences of opinion are likely to arise.

There appears to me ample evidence in the Bill that the suggestions made by different professional societies have been largely accepted, more especially those made by the Royal Institute of British Architects as to getting into one Bill all matters relating to streets and buildings, including lines of

frontage, sky-signs, &c.; but the London County Council have excluded, and I think wisely, for many reasons the suggestion that matters of drainage should be incorporated.

The Council, I think, have been anxious to make their Bill as complete and concise as the nature of the case would permit, and in my opinion they have succeeded, and the whole has been very carefully drawn and arranged.

The Bill is divided into fifteen parts:—

1. As to the formation and widening of streets.
2. Lines of building frontage.
3. Naming and numbering of streets.
4. Open spaces about buildings and height of buildings.
5. Construction of buildings.
6. Special buildings and temporary owners.
7. Rights of building and adjoining owners.
8. Dangerous and neglected structures.
9. Dangerous and noxious businesses.
10. Dwellings on low-lying lands.
11. Sky-signs.
12. Superintending architects and district surveyors.
13. Powers to make by-laws.
14. Legal proceedings.
15. Miscellaneous provisions, including the definitions.

There are four schedules, the first dealing with the structure and thickness of walls; the second defining what are considered to be fire-resisting materials; the third giving a scale of district surveyors' fees and fees payable to the Council in respect to proceedings under the dangerous structure clauses and the clauses relating to dilapidated and neglected structures or buildings; and the fourth relating to the Acts to be repealed.

We may, I think, pass over Parts 3, 6, 8, 9, 10, 11 and 12, which in the main simply consolidate the existing law, and confine ourselves to the new or amended clauses in the other parts.

Taking Part I, which deals with the formation and widening of streets, we find that the whole of the clauses have been entirely remodelled and simplified.

To anyone who is acquainted with the present regulations they will quite agree with the preamble of the new Bill, which states that "the existing provisions are complicated and in some respects doubtful and insufficient."

The existing law enables you to form a new street by giving four weeks notice to the Council in writing and, provided you comply with the by-laws, you may at the expiration of the time, proceed with your new street.

The Bill proposes to make all new streets subject to the approval of the Council, for which purpose plans and sections must be submitted, with such particulars in relation thereto as may be required, and the decision of the Council is to be given within three months after the receipt of the application, and if the decision is adverse to the applicant, he may, if he think the refusal unreasonable, appeal to the Tribunal of Appeal, of which further mention will be made later on. The time, three months, seems to be somewhat long, and might with advantage be reduced to six weeks.

There are in section 4 seven cases in which it shall be lawful for the Council to decline to sanction the formation of any new street, which cases seem to be fair and reasonable.

The rules as to widening existing roads or passage-ways and converting them into streets are very much simplified, and as heretofore plans must be submitted to the Council for approval, but with this additional advantage, that an applicant may, if he feels himself aggrieved at the Council's decision, appeal to the tribunal before mentioned.

There are in section 6 eight cases in which it shall be lawful for the Council to decline to sanction the widening of an existing way, which appear to me to be also fair and reasonable.

The Council also propose to take powers to enable them, should they deem it expedient in the public interest that any new street or widening of a street should by reason of its length or importance, or in consequence of its forming or being so situate as to be likely to form part of an important line of communication or other sufficient reason, be of a greater width than 40 feet clear, to make it a condition of their sanction that its width be increased to a maximum of 60 feet.

This, I think, is somewhat unfair to the applicant as it stands, as he has to sacrifice perhaps 50 per cent. more of his ground to form the street, simply because a road through it happens to be an important line of communication, which may or may not benefit his land; this is, of course, subject to appeal to the tribunal. But their appeal would, I take it, only decide how far it was for the public convenience, and could not deal with compensation for any sacrifice of ground which such public convenience might entail. There should be in fairness to the applicant a clause inserted to enable the Council, should the convenience of the public demand an extra width of roadway, to purchase such extra land required beyond the 40 feet at its market value.

Section 9 provides that buildings are not to be erected (without the consent of the Council) at a less distance than 20 feet from the centre of the roadway, if for carriage traffic,

* A paper read at St. James's Hall before the Society of Architects, by Mr. Ellis Marsland. Mr. George Baines, F.R.I.B.A., in the chair.

and 10 feet from the centre of the roadway, if for foot traffic only; this corresponds with existing provisions, but a further power is added enabling the Council to increase this distance to 30 feet in case of a carriage-way if, after consultation with the local authority, it is expedient in the public interest so to do.

I think this is also a little unfair to the applicant, unless compensation be granted, as I have previously suggested; as in some cases if the owner set back 30 feet the remainder of the ground might be valueless for his purposes. There is, however, in this case power of appeal to the tribunal, but I query as to whether they could deal with the question of compensation if they deemed it expedient to uphold the Council's decision.

The question of compensation is admitted in section 13, which deals with buildings projecting beyond the general line in a street, should they be destroyed by fire or other casualty, or demolished, pulled down or removed to a greater extent than one-half. In such cases the Council may require the said building to be set back and grant compensation to the owner, the amount of which, if not agreed among the parties, may be referred to the tribunal of appeal.

There is a proviso at the end of this section which, I think, should be known, as it is not in the present Acts. It runs thus:—"Provided that the tribunal in assessing the amount of such compensation shall take into consideration any increased value or improvement which may accrue to the building or other property of the same owner by reason of the setting back of the building." This has a flavour of "betterment."

Section 14 is a new provision giving the Council power in sanctioning plans for a new street (not being within three miles of St. Paul's Cathedral) to require a forecourt not exceeding 5 feet wide on one or both sides of the road; such forecourt may be enclosed in the case of private houses, but in the case of shops, public and refreshment houses, to be left open and dedicated to the public.

I think the forecourt is a good provision, but whether the retail trader will like his shop set back 5 feet from the foot-way is open to question, notwithstanding the compensating advantage the forecourt gives him to display his goods, as he generally prefers, at considerable inconvenience to passengers, to place them on the public way.

A like provision is inserted for existing private houses with forecourts when adapted for shops, &c., to be similarly treated. I have dealt somewhat at length with this division of the Bill, as so many of its provisions are new.

Coming to Part II., which deals with lines of building frontage, we find that—

The present rules are retained, and that no building or structure shall be erected beyond the general line without the consent of the Council, such general line to be defined by a certificate of the superintending architect, subject to revision by the tribunal.

Should the Council grant consent to a building beyond the general line, they propose to make it a condition that land to the extent they may think proper be dedicated to or left open for the public use, and that the building for which consent is given shall only be used for such purposes as may be specified, or shall not be used for any particular purpose, as the case may be, and may generally impose any other condition deemed expedient in the public interest. This is generally now done by the Council, but the right to do it is perhaps open to question. These provisions, however, make it clear.

Passing over Part III., which deals with the naming and numbering of streets, and needs little comment by architects, we pass to Part IV., which contains perhaps the most contentious portions of the Bill, dealing as it does with open spaces about buildings and the height of buildings, and alters the existing law to a very large extent.

Section 29 provides a very useful amendment as to open spaces to be provided in front of buildings which do not front upon a public way. It often happens that blocks of dwellings are placed one behind the other or fronting one another, and an insufficient amount of space is left between the blocks. This section provides that where the blocks are 40 feet high and upwards, 40 feet shall be the minimum amount of space provided in front of them, and if the buildings are less than 40 feet high then the space left is to be equal to the height of the building, but in no case less than 20 feet. I fail to see that this will be any hardship, but will, I think, be rather helpful than otherwise to the architect, as it will provide him with a fixed rule to enable him to overcome the arguments of an exacting and perhaps unscrupulous client who does not so much consider the health and convenience of the tenants as his own profit; and at present an architect is often compelled to crowd blocks of buildings together when his better judgment would lead him to keep them further apart.

The want of a rule such as this has caused large areas of ground from which insanitary dwellings have been removed to be again covered with high blocks of buildings, which will be in a few years, if they have not already so become, little better

from a sanitary point of view than the dwellings which preceded them.

It will be observed that this section applies to domestic buildings only, and not to blocks of offices and warehouses, and disarms to a large extent the opposition which might otherwise be expected.

A question, I think, might be raised on this section as to what was to be considered the front of a building, and this point should be defined, or the clause-redrafted and made to state definitely the spaces between blocks of dwellings, although section 34 may help in the matter, but it would be as well to save as much as possible appeals to the superintending architect.

Section 30 is an attempt to provide an adequate amount of open space in the rear of new buildings. At present the amount of open space required upon rebuilding a dwelling-house upon an old site is 100 square feet, which may be either at the side or in the rear, and need have no relation whatever to any room or window it is supposed to benefit, and need not be at the ground or any fixed level.

When a dwelling-house is erected upon a site not previously occupied by a building the open space in rear is regulated according to the frontage—from a minimum amount of 150 square feet for a dwelling-house having a frontage of 15 feet up to a maximum amount of 450 square feet for a building exceeding a frontage of 30 feet—and such open space is to be provided above the level of the ceiling of the ground-floor storey, and is to extend throughout the entire width.

This does not work well in all cases, for where there is any projecting addition to the building in rear which extends beyond the back front of the main building a very small space suffices to meet the terms of the section from which I have quoted.

It is now proposed to have a minimum of open space amounting to 150 square feet, but that there shall be a distance of at least 10 feet from the back of any building or addition in rear from the boundary of the property or other premises. This space is to be at the ground level in the case of a domestic building, and is to be open except a water-closet and receptacle for ashes, and in the case of a building other than a domestic building, the open space is to be provided 12 feet from the ground. This will insure in most cases more than the minimum of 150 square feet, as will be seen in the case of a building of 15 feet frontage, the whole of which space is obtained irrespective of any space left open alongside any projection from the back front.

In addition to this it is proposed to further increase the open space should the building exceed in height the space formed by a horizontal and diagonal line, which will perhaps be better explained by the diagram. It is proposed to draw a horizontal line at the street level through the centre of the plot of ground to the rear boundary; it is then proposed to draw from a point at the extreme boundary, a diagonal line at an angle of 45 degs., and no part of the new building is to come outside the space so drawn, except dormers, chimneys, gables, turrets or other architectural ornaments, aggregating in all to not more than one third of the width of the real elevation of such building, and when any doubt arises as to the application of this rule the Council's decision to be final.

I must confess I do not like this proposition, as it would tend to cut buildings about too much, and form awkward-shaped rooms and loss of much useful space, and would foster underground rooms, as where an owner found he could not go up he would go down, which is undesirable.

It is a very difficult subject with which to deal adequately, for although an increase of open space in rear is desirable, to make a rule for universal application is by no means easy, for what would be easy and fair in the suburbs, where land was less valuable, would be difficult and unfair where land was more valuable.

I think the method adopted in the model by-laws is as practicable as any, and that is starting with a minimum distance of 10 feet, as the new Bill proposes; this distance is increased according to the height of the building, not perhaps to the extent of the model by-laws; but I would suggest 5 feet additional distance for every 10 feet in height of the main building over 30 feet, and any additions from the main building carried up only to two-thirds the height of the main building.

There are also rules in section 32 which practically mean—when you find the new method does not work apply to the Council.

Provision should also be made to prevent any open space provided in rear being built upon, for which no provision is made in the Bill. *(To be concluded.)*

Mr. Whitworth Wallis, of Birmingham, on Sunday lectured in Manchester on "Sicily and its Art Remains." Two more lectures on the subject will be given.

THE DOMESDAY SURVEY OF WORCESTERSHIRE.

A PAPER was read at the last meeting of the Worcester Diocesan Archæological Society by Mr. Willis Bund, on the Domesday Book and the evidence it supplied about the condition of the county. According to the author, the Domesday was not in any sense a complete survey of the county, but a survey ordered by the king for the purposes of taxation, and only included the land which was subject to taxation, private land, such as the Hams, which were exempt from taxes, being excluded. They must not take the number of people mentioned in the Domesday Book—4,000—as representing the total population of the county. For instance, only one monk was mentioned at Evesham, whereas he would show that there was a large number, and there were only five churches mentioned, while probably there was a very much larger number. The fact was they could only get such details of names and land as were necessary for taxation. He had often heard it argued that because a thing was not mentioned in Domesday it did not exist, but that was an unsafe way of arguing, because unless the mention of a thing was necessary for taxation it was not included. A second point was that the Domesday Book did not give them a list of the parishes in the county. It only gave them a list of the manors in the county, and manors and parishes were by no means the same. The manors in the times of the Domesday were very much larger—they were afterwards subdivided—and consequently it was a matter of extreme difficulty to trace out limits of the land prescribed in Domesday. The modern parish by no means represented the old manor, although the name might be very similar. The history of the formation of manors and parishes was a very important and interesting one, especially at the present time when an attempt was being made to revive the old manorial assemblies in the form of parish councils, but it was one that could not be treated incidentally. The only point now to be insisted on was that Domesday was a manorial not a parochial survey of the country. Another point to be remembered was that the Domesday Hundreds, though in some cases having the same names as the present Hundreds, were by no means identical with them, that in fact they were now much larger, several of the Domesday Hundreds having ceased to exist. But it must be borne in mind that the Domesday Hundreds were made out of manors, the modern Hundreds of parishes, and this would go some way to account for the difference. The taxes that were levied under William and for which the Domesday survey was taken were in the main two geld, or Danegeld, which was a charge on each hide of cultivated land. William levied it at the rate of 2s. a hide. Probably the tax imposed in 1083-84 of that sum did not produce as much as was expected, and one reason for the Domesday survey was that the exact sum that a levy of geld would produce might be known. Hence it was that the survey, after mentioning each manor by name and who held it, then went on to say how many hides there were paying geld. There was also another tax levied on the number of ploughs; hence the mention of the ploughs in each manor, both those of the lord and those of the villein. So that the tax might be made to yield its proper proportion and to prevent an evasion of taxes—a matter that seemed not to have been unknown even in those early days—not merely the actual number of ploughs in use was given, but also the number that ought to be used, and there was but little doubt that the tax was levied not on the ploughs that were used, but on the ploughs that ought to have been used.

The three great Worcestershire abbeys were Pershore, Evesham and Worcester. Their importance measured by their estate was as follows:—Worcester had 19 manors, with 175½ hides paying geld; Evesham had 15 manors, with 140½ hides paying geld; Pershore had six manors, with 95 hides paying geld, so that between them the three had 40 manors, with 411 hides that paid tax. So far the main difference between the three houses appeared to have been in the size of the estates and the amount of the contribution to the Exchequer, but there was one fact that greatly altered the position of the Worcester house, and that was the influence of the bishop. The peculiarity with regard to the Worcester house was that the bishop seemed to have had a very remarkable power over it, and to have selected the best of the lands of the Worcester monastery for himself. He did not appear as the owner or holder from the Crown of any land in Worcestershire. All the land was held by the monastery, but the bishop appeared to have had various rights which were probably greater than those enjoyed by most subjects. Over 300 hides in the Hundred of Oswaldston he had the exclusive right of having all fines, forfeitures, and of holding all courts. He was, therefore, he would not say exactly in the position of king, but of being the source of all the jurisdiction over those 300 hides; and a hide being 100 acres, in a considerable portion of the southern part of the county the bishop was practically supreme. It was a curious point how the bishop could have this control when he was

really not the owner of the lands—the monastery being the owner. He could only give one explanation. In the Celtic, and probably in the Early British Church, the bishop was not what they knew him to be, a diocesan bishop, having control over a certain area, but he was an official of the monastery. That was certainly the case in Ireland; he believed it to be the case in Wales and also in the British Church generally. All the possessions were the possessions of the monastery, which was the religious settlement, and the bishop one of the officers of the monastery. Gradually the bishop came to be the head of the monastery, and the abbot and the bishop came to be the same person, and consequently the bishop, as the head of the monastery, had the management of all its property. In the time of Augustine, when the bishops began to have dioceses and became rulers over a distinct territory, the idea of the monastic bishop died out. But he thought the Bishop of Worcester found himself in a very comfortable position at the head of the monastery, and he was loth to give up the privileges he had exercised. Although the land belonged to the monastery, as it had always done, the bishop made a successful endeavour to retain the privileges which belonged to the head of the monastery, and consequently he retained the right of jurisdiction over a very large area of the county, and other rights and privileges as well. He really got all the advantages of a great landowner without the responsibilities and disadvantages. The monastery paid the taxes; the bishop held the jurisdiction and got the profits from the courts and the fines. The bishop's position was almost unique, and was certainly of considerable profit to him, and, he was going to say, of considerable loss to the monastery, but the whole position of the bishop with regard to the monastery of Worcester was one of very great interest, and would well repay prolonged and careful investigation. Of the nineteen manors the monastery of Worcester held of the Crown, the bishop held eight from the monastery, and the number of hides in the bishop's right that paid taxes was much larger in proportion than in the manors of the monastery. In other words, the bishop had secured the richest and the best manors for himself. It seemed clear that the jurisdiction of the bishop was twofold over the manors he held from the church of Worcester. He exercised ordinary manorial jurisdiction concurrent with that of the Crown; over the 300 hides he exercised an exclusive jurisdiction, independent of that of the crown; and he made good his claim to the satisfaction of the Domesday Commissioners.

In considering the question of the settlement of Worcester it was important to notice that a considerable part of the county was outside the pale of ordinary law, that the king's writ did not run there, and that a person who, so far as Worcestershire went, was no tenant of the Crown, was in all matters and in all causes, ecclesiastical as well as civil, supreme. The speaker then referred to the obligation which there was certainly in the case of Evesham, and probably also that of Worcester, to maintain men-at-arms for the king's service. This placed the defensive force of the country in an entirely new light, when it appeared that the men who composed it were not merely the vassals and tenants, the farm labourers and dependents, mustered for defence when required and then going back to their farm labours, but also trained soldiers who could take the command of the labourers, and whom the religious houses had to maintain for the defence of the country. In this they saw the beginning of the custom that was so zealously prohibited by the later Plantagenets and early Tudors, of private individuals keeping up a force to enable them to attack or to repulse their neighbours' attacks. This fact also gave them another reason for William's apparent harshness in putting into English ecclesiastical offices Norman bishops and abbots. He could not allow any one whose fidelity was doubtful to maintain an armed force. It would, therefore, not appear wonderful that among the steps William took to establish his power in this country was the manipulation of the abbeys and bishoprics. To those who submitted great favour was shown; on those who did not submit William's hand fell heavily. The speaker contrasted the treatment of the Abbot of Winchcombe and the Abbot of Evesham, the former being deprived and imprisoned, while the latter, who submitted and remained true to William, received great favours and increased powers. Mr. Willis Bund showed that the Worcester and Evesham abbots submitted at a very early period, and thereby saved most of their estates. Their example, he said, was followed by the other houses, and it was one of the curious points in the Worcestershire Domesday how little as a rule was lost by the ecclesiastical landowners. What was lost could be explained on other grounds than Crown confiscation. There were great changes. The old men were displaced for new ones, but in mere extent of possessions the religious houses lost little.

Referring to the Sheriff Urso, who was said to have been the chief of the subsequent spoilers of the monastery, the speaker admitted that there were numerous instances that, at first sight, went to prove it, but it was possible that there might

be another side of the question, and that even Urso was not so bad as it was the fashion to make him out. It must be remembered that Urso was sheriff, and that it was his duty as sheriff to seize and take possession of any land that a person had obtained a judgment to recover from another. It was his duty to hold lands in his possession which were disputed, and the probability was that he seized the land and kept it. He seized land of which the ownership was doubtful, and retained it until ownership was proved. Claims to ownership were never admitted, and the time for delivering it up never arose. Evesham lost a lot of land in these disputes. There was a claim by Evesham to Bengeworth, and the claim was referred to a council. The sheriff took possession of the land, and he certainly held Bengeworth for over 200 years, and although we spoke now of the delays of the law it was probable that cases lasted much longer in those remote days. Thus the sheriff got possession of lands, and he retained them, but it was more likely that he got eventual legal possession of them than was generally supposed. In this dispute Evesham was despoiled of a good deal of land by the sheriff. Worcester also lost some land. A great dispute was as to the right of the bishop over the south of the county, and that Abbot Walto disputed. This dispute was referred to a court of the king's barons, and Freeman's History said that in consequence of the decision the sheriff took possession of the land to hand it over to Worcester, but he did not do so. Mr. Willis Bund further remarked that the Domesday only mentioned one monk. It said that there was a monk placed in the church of Evesham to pray for the soul of Earl William. The church of Evesham did not seem to have objected when they got 240 acres of land to support the monk to allow prayers to be said for Earl William, although he had plundered many monasteries. Yet at this time it was clear that the Evesham monastery had at least 100 monks. Probably there were as many at Worcester, and perhaps 50 at Pershore.

A curious point was that Worcester was the largest holder of slaves of any of the monasteries of the county, and certainly one of the largest in the country. The county had 1,520 villeins, of whom Worcester had 216. Worcester had 131 out of the 1,728 bordarii, 116 of the 622 male slaves and 25 of the 101 female slaves. His suggestion was that the slaves came from the expeditions into Wales. When Wales was invaded, any prisoners who were taken were brought back as slaves and put to work on the lands of the monastery. He was aware it was said that the slaves were to a great extent criminals—criminals who had not the money to pay the fines for their offences, which were all condoned for a money payment more or less. He thought the Domesday Book, by showing that Worcester were the great slave-owners of the county, brought before them a feature of history which they would otherwise not get. It was remarkable to find the house of the blessed Dunstan, who had done more than anyone else to do away with slavery in England, was so long a holder of slaves. The number of female slaves was larger than in any other county mentioned in Domesday. In proportion to population Pershore had more bordarii than Worcester and fewer villeins and slaves. That was what they would expect, Pershore being rather in the second line of defence, and very likely having taken less prisoners. Evesham had 156 villeins compared with Worcester 216 and Pershore 115, and 96 bordarii against Worcester 131 and Pershore 113, and 42 slaves against Worcester 131 and Pershore 24. Mr. Willis Bund further remarked upon the large proportion of the total of the slaves in the country which were to be found in the Welsh border counties, Worcestershire having more than other counties, and upon the stimulating effect the slave market at Bristol might have on slave traffic.

PARTY STRUCTURES.*

(Concluded from page 99.)

NOW we come to "Party Structures." I must say a few words on this portion of the subject. The definition in the statute says, "Party structure" shall include party walls, and also partitions, arches, floors and other structures separating buildings, storeys or rooms which belong to different owners, or which are approached by distinct staircases, or separate entrances from without.

Then we have in section xxiv.:—"Every party arch and every arch over any public way or passage, &c., shall be constructed in a certain way. Please note the "and" here. This section and the definition of "party structure" contemplate clearly the construction of party arches.

Next we have the fourth right of the building owner in section lxxxiii.:—"In the case of buildings having rooms or storeys the property of different owners intermixed, the building owner has a right to pull down such of the said rooms or storeys, or any part thereof, as are not built in conformity with

this Act and the two preceding Acts, and to rebuild the same in conformity with this Act"—that is, I understand it, with proper party walls of incombustible materials, in accordance with section xxiv. And the enactment as to the expenses in section lxxxviii., namely, that the expenses "are to be borne jointly, regard being had to the use that each owner makes of such rooms or storeys." Clearly by this it is supposed they still will use such rooms or storeys. But then we have in section xxvii.:—"Every building shall be separated by external or party walls from any adjoining building." I will illustrate an example of a party structure by a case which occurred within my own experience. A was building owner of a house in X street. B was adjoining owner of a house in Y street. A pulls down his house, and finds that B has a room on ground floor that extends right beyond the other portions, i.e. as shown on plan G I K L. This B has owned as long as can be remembered, but there are no deeds to show where the boundaries between the two properties are. Can it be contended that A has a right to put up the party wall at G L, and remove this portion G I K L at ground floor and add it on to his house? I do not think so, any more than that B could have the right to put the party wall at I K. All A has the right and would be called on to do would be to construct the floor over and under ground storey in accordance with section xxiv.—that is, either with arches or an incombustible floor, though this will not be literally in accordance with section xxvii., rule 1. There is clearly an omission in the Act. Either "party wall" should have included "party structure" in the definition, or rule 1 of section xxvii. should be, "Every building shall be separated by external walls or party structures from any adjoining building," as the definition of party structure includes party walls, but it is quite clear that party structures were contemplated by the Act, otherwise they would not be enacted for as they are.

3. The Statutes and Enactments now in Force. The Rights of Building and Adjoining Owners.

Part 3 of the 1855 Buildings Act, section lxxxii. explains that the building owner is the owner of premises adjoining a party structure, who is desirous of executing any work to a party structure; the owner of the premises on the other side being called the adjoining owner. As to who is an owner under the Act, the definition in the statute is as follows:—

"Owner" shall apply to every person in possession or receipt, either of the whole, or of any part of the rents or profits of any land or tenement, or in the occupation of such land or tenement, other than as a tenant from year to year, or for any less term, or as a tenant at will."

There are many Superior Court decisions on this subject, but I only propose to touch upon a few:—In *Hunt v. Harris*, the judges (Chief Justice Erle, Justice Byles and Justice Smith) decided that the owner responsible for the payment of his share of a wall that was rebuilt, after having been condemned as a dangerous structure, was the beneficial owner, who held a long lease of certain premises, and not his underlessees, but it was remarked by Mr. Justice Smith that it was expedient to deal with each case as it arose. In *Filmingham v. Wood*, Mr. Justice Chitty decided that it was necessary to serve party wall notices on every underlessee, whose term was greater than that of a tenant from year to year. It will be seen by these two decisions that it is necessary to serve underlessees with separate notices, though in the case of a dangerous wall which has been condemned, they may not be responsible for the cost of rebuilding. In the case of *Cubitt v. Porter*, it was held that in the absence of evidence of ownership of a party wall, which is included in "party structure," a jury is entitled to find that it is owned by the adjoining proprietors as tenants in common. But in the *Standard Bank of Africa v. Stokes*, whatever the rights at common law in the case of buildings under the Act, such a right no longer exists, but the right depends upon the Act itself. This is a very important decision and shows us how necessary it is to follow out strictly all the enactments. And again, in *Cubitt v. Porter*, the common user of a wall separating lands belonging to different owners is *prima facie* evidence that the wall and the land on which it stands belongs to the owners of those adjoining lands in equal moieties as tenants in common.

The general practice, as far as I know, among architects is to serve notices on the underlessees, and in certain cases to receive contribution from them.

Section lxxxiii. gives the rights of the building owner. Section lxxxviii. enacts how the expenses shall be apportioned.

I think, perhaps, it will be best to read these sections together. The building owner shall have the following rights:—

1. To make good or repair any party structure that is defective or out of repair, and the costs in such case shall be borne by the building owner and adjoining owner in due proportions, regard being had to the use each makes of the structure.

2. To pull down and rebuild where so far defective or out of repair as to be necessary or desirable, and the expense shall be

* A paper read at the Architectural Association on February 2, by Mr. E. Woodthorpe, M.A.

borne jointly, regard being had to the use each makes of the structure.

3. A right to pull down any timber or other partition that is not in conformity with this Act or with the two preceding Acts, and to build a party wall, each owner bearing his due proportion of the cost, regard being had to the use he makes of the structure, and also to the thickness required by each building.

4. In the case of buildings having rooms or storeys, the property of different owners intermixed, a right to pull down such of the said rooms or storeys not in conformity with this Act and the two previous Acts and to make conformable, the cost to be divided, regard being had to the use each owner makes of such rooms or storeys.

5. To pull down irregular arches over passages belonging to other persons, on the same terms as to costs.

6. A right to raise any party structure permitted by this Act to be raised or any external wall built against such party structure on condition of making good all damage to adjoining owners' premises or to internal decorations, and on condition of carrying up to the requisite height all chimneys of the adjoining owner on or against any such party structure or external wall.

The cost of all this is to be borne entirely by the building owner.

It must be remembered that this clause does not give the building owner any right to raise a structure so as to obstruct ancient lights in the adjoining premises (see *Crofts v. Haldare*, before quoted), and of course the wall must be the requisite thickness required by the statutes to allow of the extra height. Under this section the building owner has the right to underpin. The Master of the Rolls (Jessel), in *Standard Bank of Africa v. Stokes*, explained that the word "to raise" meant *inter alia* "to extend, to enlarge," and accordingly this clause allowed the extension of the wall downwards in underpinning.

In the case of *Bradbee v. Christ's Hospital (Governors)* it was held that "the defendant had no right to underpin the party wall, either partially or wholly, unless that could be done without injury to the plaintiff's house, even though it might be doubtful whether the interests of the parties were several or whether they stood in the relation of tenants in common."

I think it necessary to mention shortly a case recently decided, namely, *Williams v. Bull*. Williams, the plaintiff, owned a house. After serving notice on the adjoining owner, Bull, the defendant, Williams pulled down the party wall separating his house from the defendant Bull's house. He then rebuilt the wall partly on his own land and partly on Bull's land, but raised it to nearly double the height at his own expense. In course of time the defendant Bull pulled down his own house and rebuilt it to a greater height, using the upper part of the wall in accordance with a party wall notice. The plaintiff, Williams, then brought a trespass for interfering with the upper part of the wall that he had raised, seeing that the defendant had not paid for it. Mr. Justice Mathews gave his judgment in favour of the defendant.

It is not at all clear to me from the report I saw of the case whether there was any award in either case. I should think not, otherwise it would never have arisen. I shall only make one remark on the case, namely, that it seems to me an unfair decision and contrary to the recognised custom, but I cannot help thinking there was either some other point in the case, or the action should not have been one for trespass but for the sum of money for the share of the wall built by the plaintiff and afterwards used by the defendant. Apply this decision to the first case I illustrated of the lean-to roof, and a great injustice might be perpetrated, but every case must be considered on its own merits.

In excavating ground for building or repairs any carelessness or negligence causing or accelerating the fall of an adjoining house will give a good cause of action (*Dodd v. Holme*).

And a man who orders a work to be executed on his own premises lawful in itself, but from which, in the natural course of things, injurious consequences to his neighbour must be expected to arise, unless means are adopted by which such consequences may be prevented, is bound to see to the doing of that which is necessary to prevent the mischief; and cannot relieve himself of his responsibility by employing someone else to do what is necessary, and so prevent the act he has ordered to be done from becoming wrongful (*Bower v. Peate*).

Then we come to 7. Right of building owner to pull down any party structure of insufficient strength for his purpose and to rebuild the same of sufficient strength on condition of making good all damage, the whole expense, including all the damage, to be borne by the building owner.

8. A right to cut into any party structure on condition of making good all damage, the whole cost, including the damage, to be borne by him.

9. He may cut away any footing, any chimney-breast, jambs, or flues projecting from any party wall, to erect an external wall against such party wall, or for any purpose, on condition of making good all damage; similarly the cost of all this must be borne by the building owner solely.

Of course, in the case of cutting down a chimney-breast,

provided the district surveyor has first certified that it may be done without danger to any adjoining building in accordance with rule 15, section xx.; and, of course, provided that he gives another footing to the wall where cut away, either lower down by underpinning or in his own wall, otherwise he would be causing damage to the wall, and further, it would contravene the first schedule by not having proper projection of footing on either side thereof.

10. The building owner has a right to deal with the wall of an adjoining owner that overhangs his ground, on condition of making good all damage.

11. A right to perform any other necessary works.

But it must be borne in mind that unless either the consent of the adjoining owner or a proper award has been obtained, these works cannot be carried out by the building owner, even though he has given the three months' notice—I mean, if he wishes to act within the law and protect his client from hostile action.

Again referring to the case of the *Standard Bank of Africa v. Stokes*, such a work as underpinning, even though unattended by any danger to the wall, cannot be carried out where a difference has arisen between the building owner and the adjoining owner unless they concur in the appointment of one surveyor, except by an award as provided by section lxxxv., rule 7. A building owner who pulls down a party wall is not bound to protect, by a hoarding or otherwise, the rooms of the adjoining owner during such pulling down and rebuilding (*Thompson v. Hill*); only I must say this is not the usual custom.

Section lxxxiv. deals with the requisitions of the adjoining owner to the building owner to build chimney-jambs, breasts, flues, piers or recesses.

4. The Usual Procedure.

Section lxxxv. gives the rules to be observed with respect to the exercise by building and adjoining owners of their respective rights.

Rule 1 of section lxxxv. says:—No building owner shall, except with consent of adjoining owner, or where structure is dangerous and has been condemned, exercise any right unless he has given three months' notice. If the wall has been condemned as a dangerous structure, it would be lawful for either owner to take down the party wall without the three months' notice, but when it has been taken down the usual procedure will have to be gone through before it can be rebuilt again.

Rule 2 states that the notice must be in writing or printed, and state the nature of the proposed work and the time at which it is proposed to be commenced.

3. That no building owner shall exercise any right to the inconvenience of adjoining owner.

5. Deals with the requisitions of the adjoining owner.

6. If either owner does not consent within fourteen days after the delivery of any notice or requisition, he shall be considered to have dissented, and a difference shall be deemed to have arisen.

7. In all cases not hereby specially provided for the building owner and adjoining owner, unless they concur in the appointment of one surveyor, shall each appoint a surveyor; the two surveyors shall select a third surveyor, and such one or three or any two of them shall settle by their award all matters in dispute, including the costs of award. "Such one surveyor" of course refers to the surveyor appointed by both the building owner and adjoining owner, and not the third surveyor; he, the third surveyor, is not an umpire, but only on an equal footing with the other two, although he generally has to adjudicate between them; but it must be remembered that an award signed only by him as third surveyor is not in accord with this section; either one or both of the other surveyors must sign as well. Whenever possible it is best to have the signatures of all three surveyors. It is also necessary for the two surveyors to select a third surveyor, though it is not imperative to call him in; but it should be clearly stated in the award (which in this case, of course, would be signed by the two surveyors) that he has been selected.

I am inclined to think that if these necessary steps were always taken, as they certainly should be, and a proper award made before any work were done to a party structure, and before, in fact, the structure were touched, an immense amount of difficulty might be saved, and it would be a rare occurrence to have recourse to the law courts. Where litigation has arisen it will almost invariably be found that some link in the chain of this procedure has been omitted.

In the case of the *Standard Bank of Africa v. Stokes* the judge said that "The Act gave the three surveyors power to determine the time and manner of doing any work, and it would be reducing the Act to an absurdity to suppose that the building owner had a right to proceed with the work until they had so determined."

In certain cases not specially provided for here—namely, where a surveyor dies or refuses to act, &c.—section xxi. of the Amendment Act of 1882 gives the necessary procedure in the appointment of another surveyor.

8. The award by such one, three, or any two of them is conclusive, or must be appealed against within fourteen days of delivery.

9. If either owner fails to appoint a surveyor for ten days after notice has been given to make such appointment, the party giving notice may appoint.

Rules 11 and 12 relate what appellant from award is to do.

Section lxxxvi. gives power to building owner to enter premises to effect works (of course only when entitled to do so under an award).

Section lxxxvii. deals with security to be given by building owner if required.

Section lxxxix. Account of expenses must be delivered to adjoining owner within one month of completion.

Section xc. Adjoining owner may appeal against account within one month of its delivery.

Section xci. If adjoining owner does not appeal within one month, building owner can recover as a debt.

Section xcii. Until adjoining owner pays, the building owner is sole possessor of such structure.

Section xciii. Where building owner has incurred expenses, adjoining owner liable as a debt.

Section xciv. is an important one. It enacts that where a building owner fails to do anything, upon condition of doing which his right to execute certain works is hereby limited to avenge or to make good damage within a reasonable time, he incurs a penalty not exceeding 20*l.* for each day during which such failure continues.

Section xcvi. Consent how given on behalf of persons under disability.

Section xcvi. Consent how given on behalf of a person not to be found.

Part IV. deals with payment of expenses by owners.

5. *The proposed Bill to be introduced by the London County Council, so far as it affects the rights of Building and Adjoining Owners.*

A separate evening might very well be set apart for the discussion of this bill, and to-night I shall only have time to touch upon one or two points.

By section xlv., a wall shall be deemed a party wall, though part only of it is actually used as a party wall, in the following cases:—

(a) When a wall is after the commencement of this Act built as a party wall in any part.

(b) Where a wall built before or after the commencement of this Act becomes after the commencement of this Act a party wall in any part.

Practically this means that a person, by erecting surreptitiously a w.c. against his neighbour's wall, converts the whole of it into a party wall, or at any rate for 10 feet above the lower building. Nor is there any provision to prevent any openings above that height being made in a new wall over an adjoining owner's building. This, I think, should be guarded against.

Rights of Building and Adjoining Owners.

Section lxvii. is a new section altogether.

Rule 1 reads:—If the building owner desires to build a party wall on the line of junction he may serve notice thereof on the adjoining owner.

Rule 2.—If the adjoining owner consents to the building of a party wall there (that is, on the line of junction), the wall shall be built half on the ground of each of the two owners.

This might be unfair. Suppose the adjoining owner wants a wall 10 feet high, and the building owner 80 feet high, the wall must either be half on each owner's ground (which would be unfair to the adjoining owner), or there must be two external walls.

Rule 3 is somewhat ambiguous. It reads:—"The expense of the building of the party wall shall be from time to time borne by the two owners in proportion to the superficial extent thereof which they respectively from time to time make use of."

Rule 4 says:—If the adjoining owner does not consent to the building of a party wall, the building owner must build external wall on his own ground.

Rule 5.—If the building owner wishes to build an external wall on his own ground, he may serve notice thereof on the adjoining owner.

Rule 6 reads:—"Where, in either of the cases aforesaid the building owner proceeds to build an external wall on his own ground, he shall have a right at his own expense, at any time after the expiration of one month from the service of the notice, to place on the ground of the adjoining owner the projecting footings of the external wall, with concrete or other solid substructure thereunder, making compensation to the adjoining owner or occupier for any damage occasioned thereby."

This might be hard on the adjoining owner. Suppose adjoining owner has a one-storey building only, building owner might want wall 80 feet high, and could put his footings and concrete right in adjoining owner's room, as sketch.

And further it reads:—"Where an external wall is built against another external wall, or against a party wall, it shall be lawful for the district surveyor to allow the footing of the side next such wall to be omitted." By this it would be lawful to erect a wall 80 feet or more in height without footings, if an external wall 10 feet or even less were against it.

By section lxxv., rule 1.—One month's notice will have to be given for a party fence-wall, and two months' notice served on the adjoining owner and occupier for a party wall or party structure, instead of as now, three.

By Rule 2.—The building owner must hoard in the adjoining owner's building where wall is taken down.

Rule 4.—A notice shall not be any good unless the work is begun within six months after the service thereof. These are good regulations and wanting in the present Act.

Rule 8 of section lxxv. makes it imperative on the two surveyors to select a third to act as "umpire," and an award must be made either by the one surveyor (that is, in the case where building owner and adjoining owner agree to have only one surveyor), or the three surveyors, or by the umpire of them, so that if a difference arises the two surveyors must call in the umpire, and the two cannot make the award without the "umpire," as they can in the present Act.

This, of course, would entail more expense and often occupy more time, as now so often differences are settled by the two surveyors agreeing without having recourse to the third surveyor. I can see one or two difficulties that might arise by this arrangement; suppose the two surveyors did not agree with the umpire as to his costs, they—the two—could not make the award without the umpire, but the umpire would have the power to make the award alone, though the difference might be a very trivial one, and he could put his costs down at anything he liked.

The present arrangement has been found to work well; why alter it?

Section lxxviii. is a new section and deals with a case where a building owner intends to build within 10 feet of, and excavate lower than the adjoining owner's building.

Two months' notice of this shall be given to the adjoining owner. Building owner shall underpin or otherwise strengthen the adjoining owner's wall if required, but the expense of this is not included in the expenses to be borne by the building owner, though by rule 3 the building owner would have to compensate him for any inconvenience, loss or damage.

Rule 2.—If the adjoining owner or occupier gives notice that he disputes the necessity of the underpinning, a difference arises. This section will certainly place a rather hard and, I am inclined to think, unnecessary additional restriction on the building owners. The section dealing with expenses remains nearly as at present, except that two clauses are inserted for party fence-walls. The last clause of this part of the Bill is an important one, and I will read it:—"Nothing in this Act shall authorise any interference with an easement of light or other easements in or relating to a party wall, or take away, abridge or prejudicially affect any right of any person to preserve or restore any light or other thing in or connected with a party wall in case of the party wall being pulled down or rebuilt." This is a good and necessary clause.

OFFICIAL ARCHITECTURE IN AMERICA.*

IT is perhaps as much a political as an æsthetic reflection that, while public architecture in every other country fairly represents the best that the architects can do, in the United States it is very apt to represent the worst. There is at any rate no doubt about the fact. The professional goal of a practitioner of architecture in France—the goal which he sets before himself even at the beginning of his studies, and to which his studies are largely directed—is an appointment to be a Government architect. The centralised system of administration that survives all political changes makes the public architect an official function. Not only would the notion of employing an obscure architect to design a public building be resented by the public, but the execution of such a notion would be quite impossible. An architect must prove his ability according to the tests imposed by a professional education which is itself the care of the State, and also in private practice, before he can be so much as considered when there is a question of designing an important public building. The result is that, whatever may be thought of a new public building in Paris or in the provinces, there is never any doubt that it represents what the official hierarchy and the public alike consider the acme of professional attainment. Throughout continental Europe the rule is the same. In the British Islands, where the popular agreement that the arts will flourish best if the Government leaves them alone is largely the expression of a popular indifference whether they flourish or not, it is still

* An essay by Mr. Montgomery Schuyler, published in the *Engineering Magazine* for February.

true that the public architecture represents the best that the architects can do. From the time of Sir Christopher Wren to that of Sir Gilbert Scott the architects who have stood highest with the cultivated part of the public have been the architects chosen to do the Government work.

Westminster Palace is not an object of unmixed national pride, but Sir Charles Barry was at the head of the profession when it was designed, and, although in the light of what has been learned and done since it is rather a queer example of secular Gothic, it embodies as much of Gothic as was understood at that time among the leading architects, who resented and resisted the revival that was really imposed upon the profession by the public, and of which the origin was in part archaeological and in part ecclesiastical.

Undoubtedly the Gothic revival is not seen at its best in public buildings. It was begun by the Houses of Parliament, and it may be said to have been definitely closed, so far as secular work goes, by the erection of the Law Courts. The world is pretty well agreed that this latter building is a failure, both practically and artistically, and yet it was certainly not a failure for lack of pains—of far more pains than have ever been taken to secure in America a work of official architecture that should be the best that the architects could do. The competition for the Law Courts was a model of liberality and consideration. The invited competitors were the architects most in view, and the architect finally chosen was one of the most eminent of these. Moreover, it was one of the most interesting architectural competitions that has ever been held, and Mr. Burges's design was probably the very finest achievement of the Gothic revival, and had more influence upon the practice of his contemporaries than any modern building actually erected in England, having very evidently supplied the architectural motive for buildings on both sides of the Atlantic. It is noteworthy, however, that Lord Palmerston actually interposed to dictate the style of a public building, against the protest of its architect, and insisted that he would not have Gothic, but would have "something light and airy." It would have been out of the question for such a problem to be decided in any other country than England, always excepting our own, by a layman's freak, and this official freak was especially deplorable because Sir Gilbert Scott, if he had been left to his own devices in the design of the Foreign Office, might very possibly have produced a more worthy monument of the Gothic revival than any that it has left in the shape of a public building. Since the close of the Gothic revival no public building of the first importance has been erected in England.

If such a building were projected, however, an attempt would be made, we may be sure, to make it worthy of the best that the nation could do. There would not be that complete indifference whether it was good or bad that characterises our own productions in this kind. Undoubtedly during the past quarter of a century the Government of the United States has erected more buildings for its own use than the Government of any other country in the world. It has spent more money upon architecture and got less architecture for its money than any nation of past or present times. The waste is appalling when we come to think of what might have been done with this money if the standard of official architecture had been kept up to the standard even of the best private building. If we had had a bureau of public works with a succession of able and responsible architects at the head of it, it would have had by this time a tradition of its own that would have been of immense value to the architecture of the country. For the national building in any town is sure to be a conspicuous building. With the system now firmly established in Congress of log-rolling for building appropriations, and of erecting in villages public buildings suitable, in scale and cost for the cities these villages are expected to become, it is apt to be the most conspicuous building, and the pioneer and model of edifices built of permanent materials. And what models they have been, these public buildings, from the time of Mullett and earlier. With one or two distinguished exceptions the supervising architects have not been men of high professional standing, although they have been quite as eminent as could have been expected from the conditions of their service. Indeed, the status of the supervising architect is a measure of the legislative, and consequently of the popular, appreciation of architecture. That functionary has the spending of far more money than any private practitioner. He has the supervision of ten times as much work as any conscientious private practitioner would consent to be responsible for. Yet his status is that of a clerk and his compensation such as would not tempt an established practitioner, unless such a practitioner were sustained by professional enthusiasm and willing to make sacrifices for his art. Even so his sacrifice would be vain. A busy architect in private practice has far too little time to devote to the art of architecture. The supervising architect of the Treasury, if he discharges the responsibilities his office imposes upon him in other respects, can have none at all.

The increase of these responsibilities with the increase of the public building has put it quite out of the question that the supervising architect could in any proper sense design any of

the buildings he is directed to erect. This was the sufficient motive and justification of the bill providing for the opening of the design of public buildings to competition, a bill to which many architects, having the honour of their profession and the architectural credit of the Government at heart, devoted much unselfish labour. But the measure was shorn of nearly all its purpose and effect by the amendment that was foisted upon it forbidding the Secretary of the Treasury to pay for the services of any of the architects whom he was authorised to select as competitors, except the architect whose design was chosen for execution. Nothing could show a more complete misapprehension of the purpose of the bill than this amendment. It is true that the architects at large are responsible for this misapprehension. So long as men who call themselves architects can be got to do work for nothing and submit their designs as chances in a lottery, so long will men who are unaware that there are architects and architects, and that the work of some is more desirable than the work of others, be unwilling to pay for what it seems to them they can get for nothing. Architects of repute will sometimes consent, whether or not they are well advised in consenting, to enter open competition for public works, when they are assured of competent judgment upon their designs, and when the prizes are numerous enough and large enough to give a reasonable chance that they may be reimbursed for their actual outlay. But it is perfectly well known to private builders that architects of repute will not submit their designs to lay judgment unless they are paid for preparing them. What the Government of the United States refuses to do every corporation that projects a new office building, and that desires to have a choice of designs, finds it necessary to do. It may be as well, with the law that was framed to bring about a better state of things thus shorn of its force, that the Secretary of the Treasury should have declined to avail himself of the permission the law gives him to invite people to do work for the Government for which he is forbidden to pay; and should prefer to go on entrusting the public architecture to the system that has already left it far behind private building.

How far it is behind may be judged from the comparative exhibit of the two that was made at the World's Fair. It was a most impressive object-lesson, the comparison between the buildings reared by private enterprise, under an exceptionally fortunate direction, it is true, and the building erected by the Government to represent it to its own citizens and to foreign visitors. If the American people were not capable of learning the lesson there put before them, if even a representative or a senator could not see the difference, then it is quite idle to hope for any change for the better in our official architecture. While the practice of architecture, as shown in the academic exercises that a singular good fortune enabled to be actually reared in Jackson Park, has been steadily advancing in the country at large, the official architecture of the country has been as steadily deteriorating, until now it has relapsed into positive barbarism. It was not so in colonial times, or in the early days of the Republic. Then the public buildings were the best that we could do. The old "Federal Hall" in Wall Street impressed a British visitor of just a century ago as the only edifice in New York worth looking at, and within a generation afterwards such public buildings as the City Hall of New York and the State House of Boston showed that the State understood and desired the best that its citizens could do. Nay, take as a standard of comparison the public buildings at Washington, and draw the line at the middle of the century. With all their defects and inequalities, the public buildings erected before that date did really represent the highest architectural attainment that was available at the time. Who that has seen both Washington and the World's Fair, even if he be a member of Congress, can fail to perceive that it would be for the credit of the country if the existing public buildings at the capital were to be replaced by structures erected from the designs of those architects whose work was shown at Chicago? We are not saying that the formal and academic style that is common to the public buildings and the exhibition buildings would be desirable for adoption in permanent and representative buildings of our country and our time. But precisely because their classicism is common to both a just comparison can be instituted, and the comparison is at every point favourable to the later designers. There is juster proportion, more dignity, more breadth, more stateliness, more repose in the general composition of their works, as there is more refinement, more purity, a nicer adjustment and scale in the detail. In a word, they show more architectural quality. On the other hand, let anybody figure to himself a new group of public buildings at the capital by the author of the Government building at the Columbian exhibition. The imagination of the untutored observer must recoil from such a prospect. For stateliness it shows pretension; for distinction, commonness; for repose, restlessness; for elegance, crudity. It is in this comparison the work of barbarians impudently confronting the monuments of a high civilisation. Nay, there is scarcely a comparison that can be made upon the Fair grounds, except

with the very crudest and most illiterate of the State buildings, and not with more than two or three even of them, by which the Government of the United States does not appear to disadvantage.

And yet, under the system that has grown up with the acquiescence of our lawmakers, it is not to the architects of the Court of Honour but to the architect of the Government building that we should turn in case it were necessary to add to the public buildings of the capital. The deterioration in our official architecture has been at least as progressive as the advance in our private architecture. The latest of the great public buildings, happily, is the building of the State, War and Navy departments, one of the works of Mr. Mullett. It argued a deep architectural insensibility to add this fussy and multifarious structure to the collection of simple, quiet and decorous public buildings at Washington. And yet itself becomes respectable and almost distinguished when it is compared with the Government's exhibit of its official architecture at the World's Fair. The protest that the sensitive visitor to Washington feels called upon to enter against the intruder upon its peace, the shade of Mullett would be entitled to repeat against bestowing upon his work the neighbourhood of a newer building by the author of the Government building at the World's Fair.

And consider that the quality of the Government building at the World's Fair is the architectural quality of the work that the Government is doing all over the country, and spending more money upon year after year than was ever spent upon architecture by a single nation. There is much to be said about the official architecture of our lesser political divisions—of States and municipalities. The rule is that no official person cares about it or takes thought for it, and the rule consequently is that it is pretty bad. But the rule is mitigated by occasional exceptions. In any case, and if there were no exceptions, the mischief that is done by the workings of officialism in the architecture of States and municipalities would sink into insignificance compared with the mischief that is done in the architecture of the national Government. We are spending enormously and profusely every year to pervert the perceptions of the people of the United States respecting the art of architecture. What can the beneficent influence of a group of monumental buildings in transitory plaster, of which a fraction of the people have had the vision for a day or two, do to counteract the malign influence of permanent buildings, in the sight of which the people pass their lives?—an influence that reaches into every quarter of the land and into every congressional district that exults in an enterprising member who insists that his constituency shall have its share of what is going.

The Royal School of Art Needlework.

SIR,—May I call attention to a meeting to be held at the Imperial Institute on Wednesday, February 14, at 3 P.M., to submit the outlines of a scheme I have now in hand for the establishment of a self-supporting "school" of applied "design" for women in connection with the Royal School of Art Needlework, and in which I hope to enlist your hearty sympathy.

Mrs. Dunlop Hopkins, a lady who has most successfully founded and carried on such a school in America, and who has most kindly offered me her assistance in establishing a similar school in England, will address the meeting on the subject.

Twenty-two years' experience as President of the Royal School of Art Needlework teaches me that there exists in the above scheme a wide and, in this country, hitherto untried field for the further development of remunerative work for women.

A brief statement of the main features of the undertaking will be found below.—Your obedient servant,

HELENA,

Princess Christian of Schleswig-Holstein,
Princess of Great Britain and Ireland, President
of the Royal School of Art Needlework.

Cumberland Lodge: February.

The proposal is to found a school where women may learn from practical teachers to design for various branches of decorative art, beginning with good draughtsmanship, in which each student will pass before going further to study. Secondly, the various styles of architecture, to which all decorative art is

more or less related; and with architecture will be connected the study of historic ornament.

Some of the heads of the special studies will be:—

1. The application of design to wall decorations, viz. wall-papers, silk tapestries, needlework, chintzes, frescoes, &c.
2. The application of design to floor decorations, viz. pavements, mosaics, rugs, carpets, linoleum, &c.
3. The application of design connected with architectural study, more especially to interior house decorations and fittings.
4. The application of design to various branches of metal-work, ornamental plaster-work and modelling, glass painting, furniture needlework, book illustrations, book covers, &c.

It is ultimately intended to form a library and museum in connection with the school.

It is estimated that the fees paid by the students will amply cover all expenses of management and tuition.

The sale of designs will be for the benefit of each designer, who will thereby receive the reward of individual talent and industry, even during the continuance of her tuition.

[The above letter was not received in time for publication last week.]

GENERAL.

The Society of Painters in Water-Colours have elected Mr. Herkomer, R.A., Mr. Waterlow, A.R.A., and Mr. Lionel Smythe as members, and Mr. J. R. Weguelin as Associate.

The Annual Report of the Fitzwilliam Museum Syndicate states that the number of visitors during the past year was 41,728, and to the Museum of Archaeology 5,480. Mr. Rhodes James has been appointed director in the place of Professor Middleton. Fifteen early Italian pictures were purchased from the collection of Mr. Charles Butler, of Warren Wood, Hatfield, and some were formerly in the Toscanelli collection at Pisa. The most important work is a panel of the Virgin and Child with Saints, by Cosimo Roselli.

Messrs. C. O. Ellison & Son, of Liverpool, have been appointed architects for the additions to the North Wales Lunatic Asylum, which will cost 60,000*l*. Nineteen designs were submitted; out of them four were selected, and the authors of the three which were not adopted are Messrs. Aspinall & Smith, Blackburn; Mr. J. D. Mould, Manchester; and Messrs. Stanger & Stanger, Wolverhampton.

The Surveyors' Institution will meet on Monday, the 19th, when the adjourned discussion on the paper read by Mr. H. Blackburn at the last meeting, on the "London Streets and Buildings Bill, 1894," of the London County Council, will be resumed.

Mr. R. H. Tweddell will read a paper on "Forging by Hydraulic Pressure" at the meeting of the Institution of Civil Engineers on the 20th inst.

Mr. Hugh Stannus will on Monday next, at the Society of Arts, commence a series of Cantor lectures on "The Decorative Treatment of Artificial Foliage."

Mr. R. Hedley, on Wednesday, the 14th inst., read a paper on "Wood-Carving" at the meeting of the Northern Architectural Association, Newcastle-on-Tyne.

The Death is announced of Mr. John Alison, city surveyor of Manchester, to which post he was appointed nine years ago.

Mr. S. E. Purchas, city surveyor of Worcester, died on Monday at the advanced age of seventy years. He commenced practice as a surveyor in Worcester in 1848, and in 1856 he was appointed city surveyor.

Sir A. W. Blomfield, A.R.A., will be called in to advise the Dean and Chapter, Chester, with respect to the damage wrought at the cathedral by the gale. The pinnacle which was blown down stood at the north-east corner of the north transept. It alighted on the outer roof of the chapter-house, smashing through it, and seriously damaging and straining the vaulted inner roof.

Mr. A. P. I. Cotterell has been instructed to prepare plans for the sewerage of the Ashley Down Sewerage District.

Messrs. Bruce & Hay, architects, Glasgow, have prepared plans for the proposed co-operative seaside homes at Seamill, which will shortly be commenced.

Mr. J. W. Blakey will read a paper, entitled "A Few Notes on Quantities and Specifications," at the meeting of the Liverpool Architectural Society on Monday, the 19th inst.

At the Meeting of the Royal Scottish Society of Arts, Edinburgh, Mr. J. N. Miller, Joppa, described a gasalier water feeder, the object of which, he explained, was to enable a person whilst standing on the floor to fill the cup of a water-sliding or telescopic gasalier with the water requisite to prevent the escape of gas.

The Architect.

THE WEEK.

SOME months back we called attention to the remarkable case relating to Messrs. SHOOLBRED'S premises in Tottenham Court Road, in which the result depended on whether fireproof flooring could be considered as equivalent to the division prescribed in the Building Acts for separating areas of 216,000 cubic feet, or in other words, whether security could not be attained by a horizontal layer as well as by a vertical one. Messrs. SHOOLBRED had instructed Messrs. HOLLAND & HANNEN to alter the premises, including the addition of a new building 87 feet high, with eight floors. The basement was to be used for packing, the ground floor as a shop, and the remainder of the new building was to be devoted to dining-rooms, kitchens, &c., for the benefit of the *employés*, or in other words it formed a sort of club. The floor under the kitchens was constructed of iron and steel joists with concrete. The total contents of building, including staircase, was 289,456 cubic feet, the part above the concrete floor being 62,087 cubic feet, or about a fifth of the whole. Mr. WALLEN, the district surveyor, gave notice that the limit of 216,000 cubic feet must be observed, and therefore party-walls were to be constructed. The builders and owners, on the other hand, contended that the building was not a warehouse within the purview of the Building Acts, and moreover the concrete floor, which cut off the two upper storeys, was equivalent to a party-wall. The magistrate having adopted the views of the district surveyor, the builders appealed. The case came before Mr. Justice MATHEW and Mr. Justice CAVE on Tuesday, and the magistrate's decision was upheld. When the Building Acts were drafted party-walls were considered as the most efficient protection against the spread of fire, for what was sought was not the protection of the property of an individual, which it was his own interest to look after, but the restriction of the flames to the place in which they arose. At the same time the upward tendency of a fire should not be overlooked. The introduction of party-walls will not make Messrs. SHOOLBRED'S premises any safer than they are at present, but the people around may probably be more satisfied when they know that in the event of fire breaking out on any of the floors their risks are minimised. The decision in the Queen's Bench Division ought to bring about a needed alteration of the Building Acts, but as inside and outside law courts there is much faith in the resistance of a party-wall—although it is not always borne out by experience—we suppose no amendment is likely to be approved which would diminish the prestige of so constitutional a safeguard.

A SECOND edition of Mr. J. NEWMAN'S "Notes on Concrete and Works in Concrete" has been published by Messrs. SPON. The title is so modest there is a risk that the book may be undervalued. In the pages we have not only the benefit of English experience in dealing with the material, but learn also what Germans and Americans have realised. Men who have repeatedly employed Portland cement will be the first to acknowledge that the pages contain much information that is both useful and novel. The following will suggest the kind of "Notes" which abound:—"The experiments of Mr. COLSON on beams and flat arches of concrete showed the importance and necessity of guarding against the possibility of lateral movement in the slightest degree in the supporting girders of a floor, as by so doing the supporting power of a beam is materially increased, and before loading twenty-eight days at the least should be allowed to elapse, as at fourteen days a beam will give way that will stand at twenty-one and twenty-eight days, and at the latter date when loaded. He also found that a straight beam of concrete, firmly supported at the ends, of 8 feet 3 inches span, with $4\frac{1}{2}$ inches bearing upon each pier and 9 inches in depth, if made in arch form with $4\frac{1}{2}$ inches rise at the centre was as strong as a straight beam, although a curved strip of concrete, rising at the pier on

each side to a height at the centre of $4\frac{1}{2}$ inches, was taken away; always provided that the curved beam is firmly confined at the ends." Mr. NEWTON notices among other recent systems "The Monier," in which wrought-iron netting has been used to equalise the compressive and tensional strength of concrete. It is considered "that the wrought-iron netting can be so introduced that the tensional stresses are taken by the wrought-iron, and the compressive strains by the concrete, thus straining the materials to the best advantage. Some tests made in the building yard of the Royal Hungarian Government at Budapest showed that an arch constructed of the best Portland cement concrete would only sustain one-fifth of the load of an arch constructed on the Monier system."

At the meeting of the Llandudno Improvement Commissioners on Wednesday, a report of the finance committee was read which referred to the proposal for erecting municipal buildings at an estimated cost of 10,000*l.*; annual repayment of principal and interest combined in thirty years at $3\frac{1}{2}$ per cent., equal to 2*d.* in the pound. The committee had taken into consideration the probable revenue to be derived from the letting of the rooms in the municipal buildings, and were of opinion that the Commissioners would be justified in carrying out the recommendation of the municipal buildings committee. Therefore the Board was recommended to proceed according to the suggestions of the committee. One of the Commissioners denied that a town-hall was at present needed, and maintained that the Commissioners might with greater propriety devote their attention to improvements of a more urgent character. There were so many demands upon the resources of the Commissioners at present that they must be careful that at an early date they did not land the town in a rate of 5*s.* 6*d.* The Chairman said the Board were not discussing the question of erecting a hall, but simply whether they should not offer premiums for designs. If decisive steps were not promptly taken there was a possibility that the proposed site might be utilised for another purpose. There were nine votes in favour of the adoption of the report and seven against it.

HOWEVER inequitable the arbitration clause may appear sometimes to contractors, it cannot be too generally known that the courts are bound to uphold the clause unless there are most extraordinary circumstances to support a different view. Yet scarcely a year passes without some attempts being made to persuade judges to disregard the arbitration clause. A case of the kind came before the Queen's Bench Division on Wednesday. Messrs. ECKERSLEY & Co. entered into a contract amounting to about 60,000*l.* with the Mersey Docks and Harbour Board. The common arbitration clause appeared in the deed. A heavy claim was made by the contractors for damages caused by delay and the undue interference of the Board's officers, and an action was commenced. The Board claimed that all disputes and differences were to be referred to the engineer, and Mr. Justice GRANTHAM, before whom the case came in chambers, made an order staying all proceedings. Messrs. ECKERSLEY appealed on the ground that the great part of their claim was outside the contract altogether; and secondly, that even if the claim were held to be within the arbitration clause, it would not be right to refer the matter in dispute to the engineer named therein, inasmuch as it could be shown that he was not a fit and proper person to deal with the dispute. The judges made short work of the argument, for if the engineer was not a fit and proper person, why was a contract entered into in which he was to be chief agent? and to say a claim was outside a contract did not say much for the prudence of the contractors. The decision is decisive, but we may anticipate that it will not diminish the number of attempts to remove the clause which is the most characteristic in English agreements about works.

THE edition of "Spon's Architects' and Builders' Price Book" for 1894 has appeared. In addition to the usual information (which forms an epitome of building), the applications of electricity to lighting, bells, &c., are treated skillfully.

SCANDINAVIAN TIMBER WORK.

ALTHOUGH DAHL revealed the existence of the Norwegian timber churches by his "Denkmäler einer sehr ausgebildeten Holzbaukunst aus den früheren Jahrhunderten in den inneren Landschaften Norwegens," which was published about sixty years ago, it cannot be said that the subject excited much interest except among a few architects. Norway was then far more inaccessible than Matabeleland is at present. When, however, from the systematic study of German literature it became evident that the old legends which inspired so much poetry were derived from the North, it could not fail that Denmark, Norway and Iceland should assume unexpected importance. The search after the affinities of languages produced a similar result. It was concluded also that many of the peculiarities of the Germanic race corresponded with those which were exhibited in the North. There was besides a fascination in the lives of the old rovers for men who have to exist in an age when so many things tend to convert them into machines. All these causes combined to turn the attention of people towards Norway as if it were the land of their ancestors, and no time was lost in creating facilities for those who desired to see it with bodily as well as mental vision. Among all who made the journey few were disappointed.

As a consequence, a genuine interest in the old timber construction has been created, especially in Germany. The present Emperor, who wishes to be taken as the representative of the Heldengeist, has given the best of proofs that he is able to admire the work of the Vikings as well as of the Italians. Naturally many loyal subjects are disposed to be guided by the Imperial example. We have even seen a proposal that the Stabkirchen should be accepted as affording the freshest and most suitable elements for the creation of a new and national style. Everyone who knows the excess to which supererogatory accuracy is carried in the offices of German architects will understand why there should be a yearning for anything that will admit of the exercise of a little liberty. The publication of "De Norske Stavkirker: studier over deres system, aprindelse og historiske udvikling," by L. DIETRICHSON, of Christiania, has whetted the desire to revive the old system of construction.

That timber should be the material most generally employed for the churches and other buildings was inevitable. Forests were among the bequests with which Time had enriched not only Norway but most parts of northern Europe. It would be unwise to seek after stone when timber was always within reach. Besides, the Northman's home was a boat, and what served for its construction would be considered as no less suitable for the grandest and noblest of buildings. He wished to have his associations with the sea renewed by whatever was around him on land. Nor was he in death divided from the floating home which was the dearest and safest for him. Sometimes the chieftain's corpse was sent adrift in his boat; when he was buried on the shore it was placed above his remains. Hence it has been said that "the ship tumulus is distinguished by all Scandinavian antiquaries as distinct from the round heaps raised over stone coffins or other receptacles."

Every boat exemplifies constructive skill, or a calculated amount and disposition of materials in order to resist the strains arising from the force of wind and water. The Northman esteemed that skill as too important for universal application. He reserved it, as far as can be known, for the building of churches. His own dwelling and those of his retainers were not framed work; they corresponded to some extent with the log-houses of America, which depend for safety on the inertia of the materials. Mr. SAMUEL LAING, who was one of the earliest who aided in creating a love for the old Norse ways, gives an account of one of the dwellings in Laurgaard, which would serve for those of earlier times. He says:—

The room I occupy here is detached from the family house of the farm. It consists of four walls, each composed of ten logs, roughly squared with the axe and the edges chipped off so as to make them octagonal. They are laid one upon the other with a layer of moss between each, which keeps the interstices quite tight. The logs forming the side walls are notched above and below, and those forming the gable walls so as to correspond; thus the head of each log touches the one below it at the corners, which are as tight and strong as any part of the building. Each log may be 12 inches square, so that the walls of my apartment are a foot thick and 10 feet high. The soles

and sides of the windows and the corners are lined with boards; and in good houses the whole, I understand, is boarded or panelled inside and out, but I am in one of the dwellings of the middle or labouring class. There are three latticed windows in the room, which is 18 feet square, and sixteen panes of coarse glass in each window. The floor and ceiling are boarded; the former raised from the earth by a stone wall a foot or two high, according to the level, and rough-cast with lime. The roof has a pitch of about 2 feet; it is closely boarded over on the outside, and the boards there are coated with birch-bark, peeled off in large flakes. Above this is laid earth, about 3 inches deep; retained by a ledge of the same depth along the bottom of the roof. A crop of grass or of moss growing on this earth makes it compact. Many houses are roofed with tiles and some with slates. The joiner-work in the window-frames, doors, floors, &c., is very rough and ill-finished, but all is wind and water-tight. I give this minute description because one hears so much of the log huts of America, and this is probably their mother country. It is very different, too, from the wooden tenement of the English labourer, which is but the skin of a house, having only the boarding outside and inside upon a hollow framework, without the solid log in the middle between him and the cold. The cost of such a house with two rooms below and two above does not usually exceed 50 dols., wood and workmanship included. As the wood is on the farm and any man can do the work, the number of houses about one steading is wonderful. I have counted eighteen. There is a distinct one for everything, so as, in case of fire, not to have all under one roof.

The large area covered by farm buildings, owing to the custom of assigning each of them mainly to one purpose, is remarkable, and appears to be a survival of the oldest system of planning in the country. The Northman in Norway or Iceland was a different being to his descendant the Norman in France and England. He dare not assume and did not attempt to pose as a superior being; *primus inter pares* was the most that could be said of him by the freemen. In the hall, which was built of logs, his chair was in one place, to which usage had attached some respect. Like most of the other structures the hall was a single storey, and until the eleventh century it must have been smoky, for it was not the custom to have an opening in the roof. The remainder of the buildings were no less simple in construction.

The churches were apparently in a different style. It is well known that the Northmen were converted with difficulty by the Christian missionaries, and at a rather late period, but as soon as they adopted the new doctrines they testified the strength of their belief with characteristic heartiness. For the churches they employed timber, and as the treatment of the material varies, Herr DIETRICHSON has been able to divide them into three classes, viz. (1) Archaic, A.D. 1000-1150; (2) Romanesque, A.D. 1150-1250; (3) Gothic, 1250-1500. As after the Reformation stone was preferred, the old churches became obsolete, both on account of their style and the rites which had been practised in them. They were allowed to fall into ruin, and at the present time there are, we believe, only about thirty survivors. They are so curious that no cost is spared to preserve them.

It is always risky to seek out architectural analogies; but if boats could be imagined as having straight instead of curved sides, it might be supposed that the exterior of one of the old churches was suggested by the appearance of boats that had been placed in a pile. Or if that view be inexact, it might be said that the Norwegian builders considered the roof was the strongest part of a building, and therefore they encased the churches with that kind of protection. The vertical sides are almost concealed in some cases by the expanses of roofing. The advantage of having as large an area of sloping surface as is possible is manifest. In the first place it enabled water and snow to pass away quickly, without causing much detriment to the timber. With a series of roofs the spans were diminished, and it was not necessary to have massive timbering, unless in the nave. The Scandinavian builders understood the limitation of their material as well as of their power, and they avoided transepts in their timber churches as steadfastly as in their ships. The latter circumstance is the more remarkable, because Southern precedents must have been often suggested to the builders by the clergy. The cutting of timber struts into arched forms, which was without any constructional advantage, was evidently intended to mimic the masonry arches in other lands.

The system of construction must have been inspired by the ship carpenters. In the nave each of the columns is like "the mast of some great ammirall," and seems competent to withstand very great strains. In the upper parts,

which correspond with the clerestory and triforium of masonry churches, they are stoutly braced. The efficiency of the timbering is evident from the absence of distortion in the surviving examples. The lines are not always as true as when they were set up, but the changes are due to the wear and tear of ages rather than to the overcoming of the fibres through the operation of the weight of any part of the building. As far as can be judged, the old carpenters did not seek the aid of metal bands to supplement the strength of the jointing. They depended solely on wood.

The woodwork, beside its constructive interest, is also worth attention, on account of the weird power that is seen in the carving of so many of the pieces. Moreover, the ornament enables questions to be raised about the date of the buildings. On this subject there is a valuable article in the last number of *L'Art* by M. C. ENLART. The author considers that the Scandinavian style exercised influence on the Norman monuments in France of the twelfth century; but he also believes that much of what is seen in Norway was derived from England. English inspiration is found in Gothic as well as in Romanesque buildings. Of course, we must remember that the intercourse between England and the North was very close during a long period. Moreover, as Christianity had been for centuries established in these islands, there would be a supply of missionaries available for the conversion of the Northmen. There is, undoubtedly, some affinity between the interlaced ornament that is found in Scandinavia and what is to be seen in Ireland and Scotland as well as in England. All may have been derived from Romanesque originals. It must be admitted, however, that the northern details have a sombre power which is not seen in the examples that are to be found among us. The dragons are not mere decorative compositions. They correspond with the terrible things that are mentioned in the Sagas and the legends. They might have been produced by men who knew what it was "to wrestle with the sea-serpent upon cerulean sands." The Anglo-Saxon and Celtic lines are often mechanical, but the serpentine forms of the Scandinavians are imbued with life and venom. If, therefore, the northern ornament was derived from Britain, it was translated into something that surpassed the original.

M. ENLART maintains that during the Merovingian and Carolingian periods there was little difference between Scandinavian art and the art that prevailed in the greater part of Europe. He also holds that from the eleventh to the fifteenth century northern art was affected by the influence of England, France and Germany, and that before the year 1100 there is no example to prove the existence of indigenous art in Norway, and that the greater number of the examples are not to be dated by any characteristic of the style.

The conclusions will appear startling to many, but there is a good deal to be said in support of them. Those people who are enthralled by the manliness that is revealed in the Sagas, and which was exhibited in actions that are comparable to those described by HOMER, should remember that literature and art are not always seen on the same plane. Certainly Germany can find more rational exemplars of constructive style than the timber buildings of Norway.

LONDON STREETS AND BUILDINGS BILL.*

(Concluded from last week.)

SECTION 31 is an astonishing one, and deals with the re-erection of domestic buildings in narrow streets, and proposes that should a building be re-erected and it exceeds 40 feet high, the front wall is to be set back 20 feet from the centre of the road, and if less than 40 feet in height then to such a distance as will be not less than half the height of the re-erected building, presuming that the building plots upon such a street belonged to different owners each wanting his own particular requirements. This section would impart a pleasing variety not only to the fronts but also to the skyline, as what with the setting back in front and the diagonal line coming up from the rear, the unfortunate building owner would scarcely know where he was; but as some little consolation he may enclose the piece of land which such setting back leaves to him with a fence not exceeding 7 feet in height.

However desirable it may be to get more air-space in old streets, I do not think this would attain that object, as when it was found that old buildings could not be pulled down and re-erected without being set back, every effort would be made to prop and patch up old and tumble-down premises, which would be prejudicial to the interests of good and sound construction.

Section 33 is entirely new, and deals with existing buildings which do not comply with the provisions of the new Bill. Should the owner desire to rebuild them he will be unable to do so without first having correct plans and sections taken of them to be certified by the district surveyor, and then the rebuilding is not to further transgress the new rules except with the consent of the Council.

This, again, I am afraid will make an owner think twice before he reconstructs his old premises, as, what with the chance under section 31 of having to set back 20 feet from the centre of the road, and then being able only to reconstruct his premises as they were before, will make him rather bear the ills he has than fly to others that he knows not of.

The prospect for the district surveyor is not inviting, as he will be continually getting himself into hot water unless he is very careful, and will have to be constantly certifying plans for old buildings which he must verify; and should a building fall or be burnt down he will have to create from his own imagination (with such evidence as he may be able to collect) the extent, height and plan of such fallen-down or destroyed building; and, so far as I am able to gather from the Bill, no remuneration is allowed for this, which perhaps to the general public is a minor point.

Back-to-back houses are prohibited, except with the Council's consent.

By a subsection of this same section 33, although I cannot quite see the connection, a new domestic building, if abutting upon two streets, is to have at least one window upon every storey looking upon each street—the full utility of this subsection I have been unable to define, unless it is to relieve the blankness of a flank wall—and then follows what I consider a recapitulation of the open space in rear of domestic buildings; but why this is again reverted to, as it has been already dealt with under section 30, I cannot understand, as it seems to nullify the former provision, unless the word "not" has been inserted by mistake.

Section 34, relating to courts or shafts within a building, is a new requirement.

It proposes that all courts or shafts within a building shall (if the walls around same exceed in height the length or breadth of such court) be open all the way up within 20 feet of the pavement level for purposes of ventilation to the extent of 50 superficial feet. This seems a very salutary requirement, and one with which architects would not be disposed to disagree.

Section 36 proposes to reduce the present maximum height of buildings from 90 to 75 feet, except with the consent of the Council, and should they consent to such increased height notice of such consent is to be published within one week, and not acted upon for twenty-one days after, so as to give any adjoining owners within 100 yards a right to appeal to the tribunal, and the owner of the premises, the height of which it is proposed to increase being refused by the Council, may also appeal to the same tribunal.

In further limiting the height of buildings it is provided that no building now existing or any new building shall exceed in height the distance from the front wall to the opposite side of the street. This point should be carefully considered by architects, as the rule at present only applies to new streets and not, as is now proposed, to old ones.

Coming to Part V., which regulates the construction of buildings, the first section, No. 39, deals with the thickness of walls, but why the rules as to their thickness should be relegated to a schedule, and the rules concerning other portions of the building are in the body of the enactment, I am at a loss to understand.

Referring to this schedule it will be found that the thickness of walls has in some cases been increased, and I believe brings them into line with the provisions of the model by-laws. I have prepared a diagram showing in black the thickness prescribed under the existing Act and the extra thickness proposed by the new Bill, which is added in red. An extra provision is inserted that all underpinning work shall be done in cement to the district surveyor's satisfaction, and a wall is not to be thickened without notice being first served upon the district surveyor, and the work is to be done to his satisfaction and built in cement. Concerning cross walls, an additional regulation is proposed to be made that when any portion of them forms an external wall the cross wall is to be of the thickness required for an external wall.

I think that if these thicknesses of walls were made into a table, as in the present Act, it would be more convenient for reference.

A little relief is given in section 41 to the hard-and-fast rule as to woodwork being set back 4 inches from the external face of

* A paper read at St. James's Hall before the Society of Architects, by Mr. Ellis Marsland. Mr. George Baines, F.R.I.B.A., in the chair.

a wall in the case of frames of stable and coachhouse doors, and the Council are empowered to make by-laws for further exempting oak and teak, provided the work be executed to the satisfaction of the district surveyor.

Under section 43 a table of the minimum scantlings for joists is given.

Attention is called to section 45, as it defines that a wall shall be deemed a party wall though only part of it is actually used as such, and that a wall between two buildings differing in height shall be deemed a party wall to a height of 10 feet above the roof of the lower building. At present the distance is only considered to be 15 inches. This provision will largely affect walls around a common area, and will prevent any openings being formed overlooking such area within a distance of 10 feet from any roof or flat.

In section 48 it is proposed, in factories or dwelling-houses over 20 feet high, that means of access to the roof be provided if there is a parapet, but nothing is provided where the roof has no parapet, until we get to buildings exceeding 60 feet high; then adequate means of escape from fire is to be provided, which is to be certified by the Council.

Another restriction not now existing is that the plane of the surface of the roof to every building except those for the purposes of trade or manufacture is not to incline from any external or party wall at a greater angle than 75 degs. with the horizon.

Under section 50 the course of a flue is to be defined on the face of the work by outline marks in some durable material, except when the exterior face of the flue forms part of the outer face of an external wall and not likely to be built against. This is, I think, a useful addition.

Rules are also inserted for the erection of furnace chimney shafts, which do away with the necessity of applying to the Council, a process at present very often involving delay.

A rather onerous duty is placed upon the district surveyor in section 52, as he is required to inspect and certify as safe any pipe of iron or zinc exceeding 10 feet in length once in every five years. This duty, added to that now existing of inspecting sky signs, will compel the Royal Institute, in addition to the present examination for qualification as district surveyor, to ask the candidates to undergo a special examination in gymnastics, with the Griffith Brothers perhaps sitting as assessors.

In section 55 the height of habitable rooms is increased from 7 feet to 8 feet 6 inches. This will prevent the speculating builder from compressing three storeys into the 25-feet limit of height for a 9-inch wall; and useful rules are provided as to the ventilation and lighting of habitable rooms.

Rooms over stables are to have pugged floors, and the staircases giving access to them are to be separated from the stables by a 9-inch wall. This wants amending to the extent that a fire-resisting floor of iron and concrete could be substituted for the wood-pugged floor.

Under section 56 ventilation and light are to be provided to the staircases of dwelling-houses—a most desirable rule.

Section 57 is one that concerns architects very materially, as it provides that every lift the superficial area of which exceeds 10 feet shall be enclosed with brickwork 9 inches thick, and any openings in the enclosure are to be closed with wrought-iron doors or shutters hung so as to close of themselves. This will be a very difficult rule to carry out, and will require some modification, or the application should be only to blocks of flats or public buildings.

In section 60 rules are provided for the erection of bay windows and oriels without the necessity of making special application to the Council. This will be welcomed by architects as an improvement upon the present system.

Dealing with the separation and cubical contents of buildings, I do not find that any attempt is made to provide any rules for the safety of shop assistants who have to reside in the upper parts of premises the lower portions of which are used as shops or stores. Many lamentable accidents and loss of life have occurred from the want of some rules in this respect, and I would suggest that the introduction of a new Building Act would be a fitting opportunity to provide against such disasters.

Section 67 also affects architects, and is a new one. The Council already possess powers as to providing sufficient staircases and means of exit to theatres, music-halls, and other places of public resort, but churches and chapels do not at present come within their rules. It is now proposed to frame certain rules under this section, which will provide adequate staircases and corridors of fire-resisting materials and also exits, the sizes of which are regulated by the number of persons to be accommodated; the minimum is 3 feet 6 inches, and all doors and barriers are to be made to open outwards.

Passing over Part VI. we find in Part VII. some useful provisions as to building walls on the lines of junction of the grounds of different owners, which are worthy of careful consideration, and will prevent the waste of much useful space, and allows, where an external wall is built up to the boundary of the adjoining owner, the concrete and footings to project on

to the adjoining owner's land, subject to compensation being given for damage occasioned; it also empowers a district surveyor, where two external walls adjoin, to allow footings on one side only.

The rights of building and adjoining owners are practically the same, as now only the time of notice is reduced from three to two months, and it is made quite clear that a party wall may be underpinned. Also that if a building owner serves a party-wall notice, he must act upon it within six months, and where a party wall is pulled down it proposes to make it incumbent upon the building owner to sufficiently protect by hoardings and screens the adjoining occupier, and any difficulties which have manifested themselves in the working of the present law it is proposed as far as possible to overcome.

Passing over Parts VIII., IX., X., XI. and XII., which are practically the same as the existing law, Part XIII. empowers the Council to make further by-laws, in addition to the powers in this respect which they at present possess, and on the following matters:—Open spaces about buildings, setting back of buildings, height of buildings, procedure, the dimensions of wooden bresssummers, the regulation of lamps, signs or other structures overhanging the public way, and also penalties.

Part XIV. proposes to assign exclusively to one magistrate all cases under this Bill, should it become law, with or without the execution of any duties to be performed under the Metropolis Management Act and its amendments. This would, I think, be a great convenience to all parties concerned, and would save a vast amount of time now wasted in the ordinary police-courts.

I should like to make some observations as to the constitution and duties of the tribunal of appeal proposed to be provided under section 150.

Firstly as to its constitution. Its number is to be five and to be as follows:—

One member to be appointed by a Secretary of State.

One member to be appointed by the Council of the Royal Institute of British Architects.

One member to be appointed by the Council of the Institution of Civil Engineers.

One member to be appointed by the Council of the Institution of Surveyors.

One member to be appointed by the Council, and no member or officer of the Council shall be a member of the tribunal of appeal.

The members are to be appointed for three years, and three to form a quorum.

Considering that the tribunal will have to hear appeals upon the following variety of subjects, viz.—formation of new streets, the widening of streets, increasing the width of streets from 40 to 60 feet, compensation to property owners whose premises have been burnt or destroyed and who are compelled to set back, the decisions of the superintending architect on questions of line of frontage, questions arising upon the reconstruction of old buildings, the Council's decision as to increasing the height of buildings, the engineer's decision as to dwellings on low-lying lands, and appeals under the by-laws—I do not consider the tribunal is numerous or representative enough; it should at least be seven, and as the matters to be dealt with by them deal largely with builders, the Institute of Builders should be represented upon it. Our own Society, which is a progressive one and has done much useful work, should also send one member, for, if the civil engineers are to have a member because, for some unexplained reason, the engineer of the Council has been pitchforked into the Bill for no purpose, so far as I can see, whatever—as the duty cast upon him with respect to buildings on low-lying lands could have been equally well discharged by the superintending architect—surely the Builders' Institute and this Society, as an incorporated society, should have a place upon the tribunal.

Seeing the number of subjects with which the tribunal will have to deal, those who will be placed upon it will have their time fully occupied for a considerable period. I would, in conclusion, add a few remarks upon the third schedule, which is perhaps a personal matter relating to the fees to be paid to district surveyors. The whole schedule has a district-surveying-at-co-operated prices flavour about it—a large deduction on taking a quantity.

I can imagine a builder entering a district surveyor's office and inquiring for the price list, and after deciding to have 5s. worth of this, and 7s. 6d. worth of that, and 10s. worth of the other, concluding his observations by querying whether he could not have sixpennyworth of slating thrown in, or otherwise he would prefer half a new building.

The whole schedule is very complicated and will lead to many misunderstandings, and the draughtsmen of the Bill, after offering with one hand this tempting assortment of fees, take it back with the other under section 129 by saying, "but one fee only shall be chargeable with respect to any such works done in, to, or upon any building, structure, or ground as are in pursuance of the foregoing provisions included in one notice."

I think the present schedule, with one or two modifications, preferable to the new one, and it is much simpler.

In conclusion, taking the Bill as a whole, it is well arranged, clear and concise, and with some amendments upon the lines which I have ventured to indicate, the result will be an addition to the Statute Book which the County Council may view with much satisfaction, and the general public be greatly benefited.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the monthly meeting held in the rooms, 114 West Campbell Street, Mr. Alexander McGibbon, A.R.I.B.A., president, in the chair, a paper was read by Mr. William Tait Connor, A.R.I.B.A., on "Theatre Planning." After a short sketch of its development, the regulations laid down by various countries for the erection of theatres and the restrictions as to site were considered. The only perfect site was said to be an isolated one having a slope towards the stage, in preference to being level, as this effects a saving in excavation and facilitates the drainage. Simplicity of plan was urged as essential, so as to be easily grasped by the audience. The subject was considered under the following heads:—(1) Approaches, consisting of entrances, exits and staircases; (2) the auditorium and its fittings; and (3) the stage, comprising dressing-rooms, scene docks, &c. In regard to entrances, it was recommended that the audience should be admitted by a special passage till the pay-box was passed, and then discharge into the main corridor, thus leaving it free at all times for exit. The various descriptions of barriers for reducing the width of passages for entrance and lifting checks were then described, also the position of pay-boxes and booking-office. Exits should be as short as possible and free from everything of a movable character, two at least being provided for each part of the house. All doors should be fitted with automatic panic bolts, and have the word "exit" above in plain letters. Staircases should not be in long, straight flights, nor yet too short, twelve steps being considered the maximum and three the minimum number. The landings should be the full width of the staircase, and never broken by single steps, the risers and treads being kept uniform throughout. Two staircases at least should be provided for each section of the house. In dealing with the auditorium, the substitution of cantilevers for supporting the balconies in place of columns was considered the greatest improvement in theatre planning within recent years. The arrangement of seats and gangways in relation to local by-laws was pointed out, and various patent seats described. The dimensions of the seating in the different parts of the house and the sighting were also touched upon. The auditorium should be well provided with windows, and balconies with escape stairs were also recommended. The necessity of making the entire building as far as possible fireproof was emphasised. In connection with the stage, it was shown how its dimensions were governed by the height and width of the proscenium opening. The position of the scene docks, dressing-rooms, stage entrances, workshops, &c., were explained, and diagrams showing the arrangements in some of the most modern theatres were exhibited. It was strongly urged that all theatres should be supplied with a fireproof curtain, those of the iron lattice type covered by some incombustible material, sliding in iron girders, and worked by hydraulic power, were recommended. The lighting, heating and ventilation were briefly alluded to.

EXCAVATIONS IN THE CAUCASUS.

A LECTURE was given on the 15th inst. before the Glasgow Archaeological Society by the Hon. John Abercromby, on "Some Recent Excavations in the Caucasus." He said the Caucasus had long been a wonderland. In Greek fable it was famed as the land of the Golden Fleece, as the place of punishment of the overbold Prometheus. It used to be considered the centre of dispersion of European peoples, and until recent times it was regarded as the region where the art of metallurgy originated. His paper was devoted to a description of some of the more recent excavations that had been made on both sides of the great chain of the Caucasus, and on the adjoining district of Russian Armenia. Premising that archaeologists are inclined to the belief that the Caucasus was uninhabited before the arrival of the use of metals, he proceeded to describe in detail the results yielded by the examination of places of interment, and afterwards summarised the conclusions of M. Chantre with regard to those belonging first to the earlier period, which he placed between 1500 B.C. and 700 B.C., and second to the later or Scytho-Byzantine period, which dated from about 700 B.C. to 700 A.D. The majority of the forms and decorative motives of the cemeteries of the iron age in the Caucasus and in all Europe were, if not identical, so analogous that we were bound to attach them to the same civilisation. It was interesting to find incrustations of iron in bronze in the Caucasus, in Switzerland, and Austria; to find daggers

with antennæ identical with those of Hallstadt; to find torques like those of Bosnia and Jura, belts of thin stamped bronze and pendants of forms thought to be peculiar to the Tyrol, spirit armlets like those in the Alps and on the Danube. While this was the opinion of M. Chantre, Professor Kondakoff, Count J. Tolstoi and M. Reinach, with fuller knowledge and writing six or seven years later, came to the conclusion that a number of objects found north of the Caucasus showed an analogy with others from southern Russia belonging to the first centuries of our era. They would not admit that the Caucasian finds were anterior to the Christian era. Mr. Abercromby next proceeded to describe the explorations of M. de Morgan in the year 1887 and 1888 of five cemeteries situated to the south of the Caucasus in a line drawn from Batoum on the west to Baku on the east. These cemeteries represented four distinct periods, the oldest from 2500 B.C. to 3000 B.C., and the latest belonging to the seventh and fifth centuries B.C. M. de Morgan divided the 250 tombs opened by him into four classes—(1) dolmens of large dimensions containing bronze weapons; (2) kists or small dolmens containing bronze arms of a later period; (3) kists of a transition period in which iron began to be used, and (4) kists containing iron alone. The oldest dolmens were found on mountain tops, even at an elevation of 9,000 feet, either isolated or in groups. In these the arms were of bronze, consisting of long two-edged swords, daggers, lanceheads, arrowheads and axes. Ornaments were rare, and included necklaces of cornelian beads and blue porcelain bangles and pins of bronze. One necklace contained a well-polished agate engraved with *Vos zebu*, which seemed to indicate relations of some kind between India and the north-west of Persia in the bronze age. The pottery was coarse and without ornament. The mortuary furniture of the second-class was rich and artistic, that of the third less so. With the appearance of iron a great change took place. Bronze weapons were gradually replaced by swords, poniards and spears of iron. Pottery affected the forms of birds, oxen and horses. From the similarity of the dolmens of the first inhabitants with those found in India, throughout Europe, and in the north-west of the Caucasus, M. de Morgan believed that they were probably all constructed by different tribes of the same Aryan race. Professor Veitch moved a vote of thanks to Mr. Abercromby, and in doing so remarked that though it was perhaps not true that the whole of Europe was peopled from the Caucasus, the similarity of the modes of burial seemed to indicate that there was some immigration from these regions. Sheriff Birnie seconded the motion. Dr. Murray, in the course of a lengthy criticism of the paper, gave it as his opinion that the author, Mr. Abercromby, had overshot the mark in carrying the period under consideration so far back as 3000 B.C. Mr. Abercromby briefly replied, and the proceedings terminated.

PICTORIAL ART.

A LECTURE was given in Leeds on the 15th inst. by Mr. F. Suddards, Art Master at the Yorkshire College, on "Pictures, and How to Understand Them." He explained at the outset that his object during the course would be to teach the average visitor to the city gallery, who was, he imagined, technically unlearned in art, how better to understand and appreciate pictures, and to enable those who were confessedly ignorant on the subject, to see paintings and other works of art from a more intelligent standpoint. Pictorial art of the present age was so varied in style, and was influenced so much by the peculiar characteristics of different individuals and schools, that it was not surprising the great mass of the people were confused amidst the diversity of styles which every picture exhibition presented for the study and criticism of its visitors, nor astonishing that a difficulty was experienced in discriminating between what was artistically sound and what was unworthy. It was impossible to lay down any set of rules for the guidance of the uninitiated. One of the difficulties which art teachers had to contend with was that definite rules were impracticable. Art would cease to be art if it were reduced to any rigid system of rules and formulæ; it would then become a science, and cease to charm. Like science, it might then be a useful factor in the world—not be, as now, a power to beautify and ennoble the prosaic existence of a workaday world. While, however, there were no rigid rules, except those which referred to the purely practical side of art, such as linear, perspective and anatomy, and which were really sciences useful to art rather than parts of art itself, there were rules in no sense rigid that were modified in a greater or less degree by the individual genius of different men. Sir Joshua Reynolds said, "Unsubstantial as these rules may seem, and difficult as it may be to convey them in writing, they are still seen and felt in the mind of the artist, and he works from them with as much certainty as if they were embodied upon paper." If there was one thing more than another which distinguished painting of the present age, it was the sympathy

which artists had almost invariably shown with the various forms of natural beauty. Landscape-painting especially was quite a modern development of art, and a development which was truly English. The beauties of natural scenery did not seem to have appealed to the old Italian masters, landscape being rarely introduced into their works except as a secondary element, and even amongst the later masters of Western Europe, who gave far more prominence to landscape in their pictures, there was very little approach towards the truth to nature which was so characteristic of the nineteenth century. The study of landscape in a thoroughly realistic way was essentially modern, in the sense that it dated from the period when Constable and Turner broke away from the traditional treatment which had been so long the fashion, and by their direct study of nature opened the eyes of the people to the loveliness of nature in its various moods and aspects. In more recent times the movement had been considerably advanced by the writings of Ruskin. Living as they did in a city given up so completely to commerce, and which could not lay claim to possess, except on the outskirts, any features of natural beauty, he maintained that the possession of an art gallery must not by any means be looked upon as a luxury, but rather as an indispensable necessity, which should receive all possible support from wealthy townspeople and the city fathers. In this way could some compensation be made for the destruction of national beauty which commerce brought in its train, and the poorer citizens might obtain refreshment and pleasure from the mirror of nature held before them in the works of art possessed by the public gallery. It would be well for the artistic and social welfare of the city if the debt which commerce owed on account of its wholesale destruction were more recognised by those who had reaped such large stores of wealth thereby. Much had been done in this direction by some of the citizens of Leeds, but much more might be done in the way of gifts of really good pictures or art objects to the Art Gallery, where the poorest might share with the rich in the opportunity of enjoying the works of our greatest artists.

TESSERÆ.

The Flamboyant Style.

FLAMBOYANT resembles in many respects our Perpendicular or Tudor architecture, but exhibits many very marked differences when we compare it with that style. Thus we have, in both these styles, pinnacles crocketed, finialled, grouped and formed into niche-canopies; surfaces covered with moulded panels, pierced parapets; and, as we advance, Italianised members and arrangements make their appearance in both. But while the Tudor style has the four-centred arch peculiar to it, the Flamboyant has the three-centred and the horizontal line arched at the ends. It is also far more common in the French than in the English style to have in various situations a multitude of niches filled with statuary, and especially in the hollow mouldings of arches. The lines of Flamboyant panelling and tracing are not by any means distinguished, as those of the Tudor times with us are, by the universal predominance of perpendicular lines. On the contrary, they run into peculiar flame-like forms, from which the name has been taken. Some of the features of the Tudor and the Flamboyant styles which most deviate from the Gothic of the better times, probably indicate in both a nearer approach to the period of the revival of Classical architecture; as polygonal pedestals and abacuses with concave sides—the prevalence of hollow projecting mouldings filled with flowing strings terminated by lines of coronal points above—and lines curved and broken in various ways, substituted for the straight sides of the triangular heads of pinnacles. The superiority in richness and variety appears to be on the side of the French style—at least we have nothing which can be well compared with the richest members of their work; especially their portals with free tracery hanging like an edging of lace from the border of the arch, and the arch mouldings completely replaced by lines of canopies and statues.

Suburbs of Ancient Rome.

The destruction of the great families under Nero and his immediate predecessors, combined with the modest habits of Vespasian, and generally with the growing disgust of the nobility at the monstrous abuse of wealth in the preceding generation, to introduce a less ostentatious style of living among them. The mansions of the nobles became fewer perhaps and less spacious, and allowed proportionably more space for the dwellings of the poorer citizens. Yet there were still great obstacles to the extension of the suburbs of Rome. The roadsides were occupied with sepulchres of twenty-five generations, and it was forbidden by feeling as well as by law to dwell within a certain prescribed distance of the remains of mortality. The performance indeed of certain ceremonies sufficed to desecrate these hallowed spots, but if we may judge from the well-known monuments of the dead which have been discovered

even within the Porta Appia, and still more numerous in quite recent times beyond it, it would seem that on this, the most frequented of all the Roman ways, there was little use made of such a privilege. When two centuries after our era Caracalla proposed to erect his vast public baths, he found, we may suppose, little impediment from private buildings at only half a mile's distance from the Porta Capena. The Grotto of Egeria, almost immediately under the Servian walls, continued in the time of Juvenal to be surrounded with a grove, the resort of beggars, idlers and the lowest classes of the people. There was a distinct village at the Milvian Bridge, about three miles from the Capitol, but in the immediate neighbourhood we read of rural villas and pastures. That there was no suburb below the city on the river banks may be proved from the absence of any trace or record of a bridge across it. It is remarkable, again, that our accounts of various events which took place a little outside the walls indicate the solitude of the country rather than the character of populous suburbs. The estate of Phaon, Nero's freedman, in which that emperor concealed and finally destroyed himself, was situated four miles from Rome, between the Salarian and Nomentane ways. The fugitives from the city pursued their way some distance along the high road, and then turned aside to reach the villa, which was described as lying among bushes and briars and approached by a track through a canebrake. At the fourth milestone in another direction Festus tells us there was the Nævian forest, notorious as the retreat of rogues and vagabonds. The soldiers of Vitellius, on their approach to Rome, encamped on the unwholesome slopes of the Vatican. Certainly there was no continuous suburb on the Salarian way beyond the Colline gate. "Cerialis," says Tacitus, "sought to enter Rome by this road; he was met by the Vitellians not far from the city among houses and gardens intersected by crooked paths." This would be in the vicinity of the modern Porta Pia. When the forces of Antonius shortly afterwards approached the city in three divisions by the Flaminian way in the centre, by the bank of the Tiber and the Via Salaria on the right and left, they were opposed by the Vitellians under the walls of the city on all three points, but the narrative gives no indication of a street combat anywhere. On the side of the Pincian the Antonians advanced by narrow and slippery paths between garden walls, and it was not from the houses but from the garden walls that the Vitellians opposed and checked them till taken in the rear by another party which entered the Colline gate. But as soon as the contest was transferred to the interior of the city then the difference was at once apparent; the horrors of civil war within the city walls, the passions of the multitude, the ghastly mixture of levity and ferocity among the spectators of the fray, baths streaming with blood, doorways choked with dead, taverns reeking with slaughter, are delineated by the first of historical painters in a vivid picture which might be transferred to the centre of revolutionary Paris. The absence of the remains of buildings, or generally of any traces of their foundations at a short distance from the city, should not perhaps be pressed too closely; it may be believed that the suburbs, wherever suburbs did exist, consisted chiefly of inferior dwellings, constructed of the light unsubstantial tufa, or even wood or of unburnt clay, all vestiges of which would of course speedily disappear both above and below the surface.

Mediæval Tapestries.

Painted hangings were largely used in the Middle Ages, though remains of them are very rarely to be met with. At Reims, in the Hôtel Dieu, several of this kind of hanging are still preserved, and have been described by M. Lebertias in a volume devoted to them, published in Paris in 1843. They were used for hanging from the triforia of churches, from windows of houses on the occasions of great solemnities and for similar purposes. The Bayeux tapestry is one of the earliest, if not the earliest, work of the kind, and was probably meant to be used in the same way. It is, as might be expected, rude in execution, but at the same time full of vigour and honesty of expression. The story is told throughout so well and naturally, that there is no possibility of mistaking it; and the character of the work executed with wool on linen is infinitely effective, and obtained with far less labour than those works in cross-stitch to which ladies devote themselves in this nineteenth century. The Bayeux tapestry measures about 210 feet by 19 inches, and is, as Augincourt observes, a history written and painted at the same time; for, as is usually the case in these early works, the figures bear their names inscribed by their sides, and there are other inscriptions below them referring to the events represented. It is all executed in wool on linen. The stitches are long, single stitches, and the lines of drapery folds and edgings are all marked with lines of twisted wool laid down on the work. The material is different, but the mode of execution is the same as in the early Durham embroidery. The subjects usually selected for these early tapestries were from the Old and New Testament, the lives of the saints, fables of antiquity, and Mediæval versions of Roman history; allegories, hunting pieces and the like were

also represented; and, in short, these tapestries exemplified as much as anything the popular feeling, spirit and literature of the age. They were mystical and chivalric in the early period, allegorical in the decline of the Mediæval period, and Greek and Roman at the period of the Renaissance in the sixteenth century. Inventories show how much these tapestries were prized. In 1385, Philip the Hardy bought at Arras, for 700 francs, a piece of 36 ells long, representing the virtues and vices. This was a "high warp" as distinguished from a "low warp." The former was most prized, and was marked with a perpendicular waif in place of a horizontal one as in the latter. And in 1419 a piece of tapestry measuring 210 square ells was sold to Jean Sanspeur for 4,000 francs. At Halberstadt, in Hanover, the choir of the cathedral still retains all its old hangings, some of them thoroughly Byzantine in their style, the others of more advanced Gothic character, all of them illustrating Scripture subjects. The earliest of these are no doubt works executed entirely by hand, but the later tapestries were loom and not hand works. The finest examples in England of these are the tapestries under the screen in the hall at Hampton Court, and those at the end of St. Mary's Hall at Coventry. Both of them appear to be the work of foreign looms. In France, the cathedral and the church of St. Remi at Reims, the church at Montpezat and the Abbey of Chaise Dieu, and churches or collections at the Cluny Museum, Dijon, Nancy, Beauvais contain some of the finest; and the magnificent series of tapestries preserved in Berne Cathedral must not be forgotten. In many of these lines of gold and silver thread are worked in with the work, and add much to the beauty of the fabric. The Chaise Dieu tapestries are fourteen in number, 10 feet in height, and of various lengths. They contain the life of Our Lord, with the Old Testament types, and have been illustrated in a volume published by M. Jubenal. The names of figures are often *appliqué* in embroidery on tapestry.

Place and Palace.

"Be it known," says Pennant, speaking of the word "place" as applied to great mansions and interpreted by him to mean palace, "that the word is only applicable to the habitation of princes or princely persons, and that it is with all the impropriety of vanity bestowed on the houses of those who have luckily acquired money enough to pile on one another a greater quantity of stones or bricks than their neighbours. How many imaginary parks have been formed within precincts where deer were never seen? And how many houses misnamed halls which never had attached to them the privilege of a manor?" This is true, but unless the words *palazzo* and *piazza* are traceable to the same root, *palatium* = place does not necessarily mean palace; and palace certainly does not mean exclusively the habitation of princes or princely persons, for in Italy, whence it comes, any large mansion may be called a palace, and many old palaces there were built by merchants. *Palatium*, it is true, with the old Romans, though it may have originally meant any house on Mount Palatine, yet in consequence of that place becoming the court end of the city, and containing the imperial palace, may have come ultimately to mean only a princely residence. Ovid uses it in that sense in his "Metamorphoses." But custom is everything in these matters. Place is now used as a variety of term either for a large house or street. Perhaps in both cases it ought to imply something of the look of a palace, or at least an openness of aspect analogous to that of a square—square in England corresponding with place, *piazza* and *plaza* on the Continent. The *piazza* in Covent Garden properly means the place itself, and not the portico.

Pre-Periclean Athens.

Athens, the place of earth's noblest sons, the hearts from whence flowed out her bravest blood; Athens, which was civilised while Arcadia still offered up human sacrifices, where hospitality became almost proverbial, and which, fostered under Cecrops and perfected under Pericles, was the grandest city beneath the Sun-god's rays. The very stirring of her plane and olive-trees was visible in the clear dawn; the hum of her countless life might be heard through the still air. There stood the Acropolis with her statues, shrines and offerings, with her glorious temples, the noblest yet to come. But though no Propylea as yet opened their brazen gates to the thronging multitude, no Parthenon, replacing and surpassing the ancient Hecatompedon, as yet enclosed the virgin goddess in all its finished splendour, yet the Erechtheion held within its Ionic circle the mystic statue of the Athene Polias, that form of the city's guardian which fell from heaven, as a sign from Zeus of favour and of love, and the rising sun kissed the lips of the Phoibos of Phidias. The Pandrosion, with its graceful portico of panathenaic caryatides, contained the sacred olive-tree which Athene produced when she contended with Poseidon for the honour of being that city's protector, also the holy fount which the sea-god caused to flow at his bidding when he smote the earth in anger at Jove's daughter. The olive-tree had been burnt by the Persians and apparently destroyed, but, lo! the

next night it had sprouted forth more verdant and vigorous than before, a sign of the indestructibility of that which comes from the gods, a mark of the immortality of a life whose roots are in heaven. It was the parent of the twelve sacred trees in the groves of the Academia, near the Temple of Athene, and these again produced the olives in the Cephisian plain, which in their turn produced all that grew in Attica. Little wonder then that stringent law, which proclaimed death to him who, without sufficient reason, should hew one of Attica's olive-trees to the ground. The Erechtheion was not only wonderful for its beauty of construction; it contained not only the blackened Zeus-given statue, but the bones of Erechthonios, whose birth was so mysterious and inexplicable, reposed beneath its sod; the golden lamp, with its asbestos wick of Carpasian flax, which, once supplied with oil, could burn for a whole year round, and the brazen palm-branch suspended above it to serve as a funnel for the smoke, both made by the young artist Callimachos, but honoured from their perfectness as if hallowed by time; the folding-stool of Daidalos; the strange old Pelasgic statue of Hermes before the door now hidden in myrtle boughs, were the oldest or most beautiful things which the sanctuary of Athene Polias contained. Add to these the sacred serpent, mysterious emblem of an elder worship, and the silver-footed throne of the Persian king taken at Salamis, and it might well be said to contain the most splendid as the most mystic trophies of the spiritual and worldly dominion of Athens.

Study of the Antique by Painters.

The introduction of a classical taste in costume by Michel Angelo and Raphael led to the practice of drawing and often painting from colourless objects, and the study of the human form from the remains of Grecian art that were discovered in their time led to the same practice. No painter before Michel Angelo and Raphael had paid much attention to the antique, with the exception of Andrea Mantegna; and the power in colour which he was hindered from acquiring as long as he imitated the Greek *bassi-rilievi* that were known to him, he afterwards gained in the school of the Bellini. That the study of form, from stone or plaster, suspends for the time all improvement of the eye in colour, and if too long continued destroys its sensibility to hues and tones entirely, is strikingly exemplified in the French schools of David and his contemporaries. Now though Raphael studied the antique with that excellent judgment that rarely at any time deserted him, though he studied it rather in its spirit than its letter, and used it as a guide to and not as a substitute for nature, yet the time spent in attention to it was so much withdrawn from the study of colour, and the substitution of classical draperies for the dresses of his time was so much more. It became also the custom of Raphael to make black chalk-drawings from nature for heads, hands, &c. of his figures, and from these he seems to have painted without again consulting the model. In the collection made by Sir Thomas Lawrence was a very admirable and finished study of this kind, as large as life, for one of the principal heads in the *Transfiguration*. The studies of the Venetians, as Reynolds has remarked, were chiefly made with colours, and so, probably, were those of the German, the Dutch and the Flemish schools. In the British Museum are some sketches of landscape from nature by Albert Dürer, made in colours only. From the time of Raphael to our own it is indisputable that those painters who have devoted the most time to the study of the antique have always been the least excellent in colour, while the greatest colourists of all schools have rarely had any acquaintance with ancient sculpture; in our own school, for instance, neither Hogarth, Reynolds, nor Gainsborough ever drew or painted except from nature.

Covent Garden in the Seventeenth Century.

Sir E. Verney took the last two houses in the Piazza on the eastern side of Covent Garden, running north from Great Russell Street, and now the Bedford Coffee-house and Hotel, upon lease from the Earl of Bedford, at an annual rent of 160*l*. There were coach-houses and stables in the back premises, and it appears from the enumeration of fixtures that, although the ordinary rooms had merely "casements," the principal apartments were distinguished by "shuttynge wyndowes," and that the door of almost every room had its "stock lock." A reservation was made of the earl's right to the "walk underneath the said messuage, commonly called the Portico Walk, as the same is now made and perfected by the said earl, but with power for Sir Edmund Verney to expel youths playing in the said walk to his offence or disturbance." Part of the houses were "waynscotted," a distinction deemed so important that "the use of the waynscott" was specifically granted in the lease, and all the separate pieces of "waynscott" were enumerated in a schedule of fixtures. There being as yet no sewer in this new district, Sir Edmund fortified himself with a clause that if he was annoyed by that circumstance as not to be able to continue there "with any conveniency," he might resign his occupation on giving the earl six months' notice.

NOTES AND COMMENTS.

THE experiment in housing large numbers of the inhabitants which has been undertaken by the Canton of Berne may be considered successful, if a return of over 3½ per cent. on the outlay can be accepted as a test. A new quarter outside the city is being created. It was found that some parts of Berne were overcrowded, and as it was considered that the industries were thriving, it was anticipated that other districts would also suffer from an increase of population. The conclusion was drawn that it would be wisest to erect dwellings on the Wylerfelde, about a mile beyond the city. Four years ago a vote for raising 85,000 francs was passed. Immediately fourteen semi-detached houses were erected. The cost per house, including fencing of garden, water supply, &c., was 4,120 francs. The accommodation consisted, on the ground floor, of a kitchen, that could serve as a dining-room also, and a living-room, that could be used for a bedroom. Above were two rooms, each adapted for a sitting and bedroom. The rent charged for a house was 20 francs monthly. In August, 1890, the sum of 100,000 francs was voted, and in the following December 800,000 francs, and other sums were afterwards assigned. Experience has enabled many improvements to be introduced, but apparently the cost per house never exceeds 4,500 francs. The tenants appear to be satisfied, and it is understood that their improved condition has a beneficial effect on their character. The Swiss authorities seem to have facilities for undertaking public works of the sort, for from the constitution of the country the smallest disbursements have to sustain a microscopic examination, and jobbery receives scant mercy from the populace. On that account, it must not be concluded that in England every venture of the kind will be equally successful.

THE majority of surveyors are aware of the existence of tenures in various parts of England which present anomalies that are not easily explained. The manorial tenure of Holderness in Yorkshire may well be classed among them. It was lately described before a local antiquarian society. It appears that in the East Riding, west of the river Hull, the early townships had been conducted on the three-field system, but in Holderness on the two-field system, without the period of fallow, the exception being Hornsea. Before the formation of the Seignior of Holderness, all the townships of the district doubtless formed separate manors, but were then absorbed in the Manor of Burstwick. The various manors were represented at the great Burstwick court by their pennygraves, officers so called because they had the right to receive a penny from persons of their manor wrongfully absent. The Manor Court was presided over by the steward, a jury of thirteen, called the Court Leet Jury, being summoned to present misdemeanours within the manor. Part of these were the affearers, whose function was similar to that of a grand jury of the present day. The under-steward empanelled another jury called the Homage Jury, whose duty it was to inquire into the committal of waste, surrenders and succession of the copyholds. The earlier return for the occupation of another's land was personal service. In the country the service became largely commuted for a fixed money payment; this was tenure in socage. In the towns a similar arrangement was adopted, except that here there was, perhaps, more of the element of rent; this was tenure in burgage. Tenure in burgage had this peculiarity, that if unchallenged for a year and a day it was to hold good for the future, whatever the circumstances. Much might be said of the free burgage tenure, as shown by the holdings in the town of Hedon. The charter of HENRY II. doubtless but confirmed what had already existed. The rents under that tenure are still gathered, under the name of "town's rents." By the reign of ELIZABETH, and during it, the governing body of Hedon had gathered into its hands considerable property by estreats falling in by reason of waste, default of rent, of repairs and of heirs, the Corporation considering itself tenants *in capite*. This was changed in 1630, when the Viscount DUNBAR brought a suit to recover the rights of the lords of the Seignior as lords of the capital fee in Hedon as elsewhere. The suit was defended on the ground that the lands and tenements were not holden of the plaintiff. A decree was issued declaring

that all future escheats should be enjoyed by the lords of Holderness, but that all alienated lands should be left in the owners' hands. It was, in fact, a verdict for the plaintiff, without any retrospective force. Among other things mentioned was the old manorial custom at Hedon that a child, man or woman, may sell and surrender their copyhold estates when they reached the age of sixteen.

THE eighty cottages which the Corporation of Dublin propose to erect on the ground obtained by the clearance of tenements in White's Lane and neighbourhood are to be one storey high. Each cottage will contain three rooms, namely, a living room, with the average length of 16 feet 3 inches and width 10 feet, and two bedrooms, one 9 feet 9 inches square, the other 11 feet in length by 7 feet 8 inches in width. A separate concreted yard will be provided for each cottage, 12 feet 3 inches in length by 18 feet 3 inches in width, with water-closet, scullery and coal-bunker. The removal of the existing houses will be an advantage, for they are among the most neglected in the city. The occupants are of the poorest class, for when inquiry was made it was found that out of a population of 640 not more than 63, or one-tenth, were employed.

As Milan from its position is more likely than the southern cities of Italy to be affected by the social and economic forces of Germany, France and England, it is not surprising that the organisation of labour in the city has not been a failure. Since September, 1891, a Labour Chamber has existed, and the old castle of Milan is used for the offices. One of the chief objects of the Labour Chamber is to establish free registries, and by thus connecting the supply of labour with the demand, to do away with the middlemen who exacted heavy fees from the operatives for whom they found work. The masons have been among the earliest to set up a registry of that sort. One of the reasons which inspired the creation arose out of a curious practice. The masons and bricklayers formerly waited to be hired on a bridge crossing the Naviglio, but in November, 1891, they resolved in a crowded meeting that this custom was "a constant insult to the civil character, the dignity and the interests of workmen." It was therefore abolished, and in February, 1892, a labour registry for masons was opened in connection with the Central Labour Chamber. The system of telephones has been of good service to the committee in making arrangements between contractors and workmen. In about six months of 1892 employment was found without the aid of the middleman for 465 masons, bricklayers and labourers, 104 carpenters, besides marble workers and other trades. An annual subsidy of 15,000 lire, or 600*l.*, is allowed by the municipality of Milan to the Labour Chamber.

M. JACQUES LEONARD MAILLET, who died on Wednesday in last week in his seventy-first year, could be taken as exemplifying what can be accomplished in France in making a sculptor out of an industrious man who was not gifted with genius. A Parisian by birth, he began his training early, and in 1845 he won the Prix de Rome. On his return his careful execution gained the favour of the judges, and in 1853 he was awarded a first-class medal, but subsequently he was deemed worthy of only second and third-class medals. M. MAILLET was able to hit upon capital titles, such as *Primavera della vita*, which raised expectation, but when only a commonplace figure was found to be so designated, the disappointment was increased. Then doubts arose about M. MAILLET having the temperament of an artist. Probably he corresponded with old GRIGNEUX in M. PAILLERON's new comedy, and possessed intelligence rather than instinct. However, he won the favour of the Court, and his works were purchased for the Luxembourg. He was asked to design table ornaments, which were melted in the fire at the Tuileries. One of his commissions has a sort of historic interest, for he undertook the restoration of the Colonne Vendôme, which had been destroyed by order of COURBET, the painter, under the Commune. M. MAILLET left directions that his *Printemps*, his last completed work, is to be exhibited in the next Salon veiled in crape.

THE CHURCH HOUSE, STOURPAINE, BLANDFORD.

VILLAGE CLUB, WALTON-ON-THE-HILL, SURREY.

LONDON AND SOUTH-WESTERN BANK, HIGHGATE.

THESE premises, consisting of a bank and shop adjoining, are now in course of erection for the directors of the London and South-Western Bank, Limited, from the designs of Messrs. TRUEFITT & WATSON, architects, of 5 Bloomsbury Square, W.C. The lower portion of the front elevation of the bank is in white Mansfield stone, the upper portion being in red brick with stone dressings. The ground floor is devoted to the banking business and consists of a banking chamber, with manager's room, &c., adjoining. The fittings are in teak. The strong rooms occupy the basement and are fitted with iron grilles and fireproof doors supplied by the Milner Company. The upper floors of the building are arranged for the manager's residence. The building throughout is fitted with electric bells and every modern appliance. The contractors for the whole of the work are Messrs. R. D. LOWN & SONS, of Upper Holloway.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. E. Woodthorp in the chair, Mr. Mountford, president, being absent through illness.

After the transaction of some preliminary business,

Mr. J. L. ROBINSON, R.H.A., of Dublin, showed a beautiful series of lantern slides, illustrating annual excursions of the Association to Shrewsbury, Taunton and Diss.

Among the views of buildings shown were those of the 1891 excursion as follows:—

Wroxeter, Buildwas, Benthall, Much Wenlock, Whitehall, Church Stretton, Plaish Hall, Shipton Hall, Albright Hussey, Moreton Corbet, Haughmond, Stokesay, Ludlow, Pitchford Hall, Acton Burnell.

In the excursion of 1892:—

Bishop's Hull, Trull, Poundisford Park, Ruishton, Creech St. Michael, Dunster, Minehead, Cleve Abbey, St. Decuman's, Bridgwater, Cannington, Blackmoor, Spaxton, East Quantoxhead, Nettlecombe, Combe Sydenham, Kingston St. Mary, Cothelstone, Bishop's Lydeard.

In the excursion of 1893:—

South Lopham, Quidenham Church and Park, Wilby Hall, New Buckenham, Scole, Rodenhall Church, Pulham St. Mary, Thelveton, Ipswich, Helmingham, Framsdon, Brome Church, Wingfield Castle, Framlingham, Earl Soham, Flemings Hall, Eye.

Mr. H. L. Florence, past president, proposed a vote of thanks to Mr. Robinson. The vote was seconded by Mr. Maurice. B. Adams, supported by Mr. Thomas Yates and carried by acclamation.

Mr. ROBINSON suggested that the Association might with great advantage revisit some of the old fields. To the Diss district, for instance, they had not been able to do proper justice.

AUSTRALIAN MOUNTAIN SCENERY.

THE following paragraph we have received from Mr. John Plummer, of Sydney, N.S.W.:—The beautiful scenery of the Blue Mountain range produces on the traveller an entirely new impression. There are no snow-capped peaks upon which the rising and setting sun produces strange and magnificent colour effects; nor does any peculiar shape of the summits strike the imagination, as in the Alps and Pyrenees of the Old World. On the contrary, from the broad plains the far-spreading mountains look rather insignificant. But gazing from the edges of the high tableland into the deep valleys below, the mind is awed by the realisation of the magnificent scale on which nature has worked in these solitudes. In many places the cliffs rise 2,000 feet perpendicularly from the valley beneath, and the hills at their feet, formed by the accumulation of *débris* from their sides and from the plateau above, appear as slight undulations. The valleys and sides of the gorges, wherever there is soil, are clothed with dense vegetation, and over all is the mantle of blue haze, which makes the whole effect most striking, and has given to the range visible from Sydney its appropriate name.

WOOD CARVING.

AT last week's meeting of the Northern Architectural Association, Mr. Ralph Hedley read a paper on "Wood Carving." He said his paper was intended for the students in architecture, and only where the art of carving was used in architectural decoration. He reminded them of the great antiquity of the art of carving. They had examples in their museums in flint, stone, bone, wood, &c. All they knew of ages gone before was in some cases from the rude inscriptions and carvings, the early Saxon interlacing pattern, which was more elaborated by the Normans. Then there was the Early English, Decorated and the Perpendicular styles. The Early English was more suited to stone, while the Decorated and Perpendicular styles of architecture were most pre-eminently adapted to wood carving, and most of his remarks would have reference to these, particularly to the latter. The eye demanded that hard and severe lines required softening and blending. This was early felt. Thus the elaborate lace-like tracery in church windows, and in domestic furnishing they had curtains and shades to soften the light. He held that carving answered the same purpose in softening cornice lines, frieze mouldings, caps, &c. The middle of the sixteenth century saw the development of the grand style itself. Mr. Hedley proceeded to describe the fine panellings and other carvings in Carlisle Cathedral. There were beautiful carvings, too, in Hexham Abbey. The miserères, though not so elaborate as at Carlisle, were very spirited. There were also some bench ends worthy of attention in the old church of the Venerable Bede at Jarrow; they were rather coarse, but full of spirit. The Perpendicular bench ends at Durham Castle were splendid examples and well worth studying, and there were also some good examples of Elizabethan or Jacobean woodwork in the staircase. There were some fine Jacobean stall ends, &c., in Brancepeth Church, and, he believed, some very small pieces of Early English tracery. He thought they were very fortunate in having so near Hexham Abbey and Carlisle Cathedral to study the Perpendicular wood carvings. There must have been a great amount of vandalism at one time at Hexham, for there were several bits of the carving in domestic furniture in the district. He had never had much time for globe trotting, but he had learned a great deal of what he knew from the Hexham and Carlisle woodwork. Of course, he had sketched in many other cathedrals and churches further afield—Exeter, Norwich, Chester and Ely more particularly. The most elaborate poppy-heads he had seen were at Chester. Some were of a very quaint style, in particular one with three angels, the middle one forming the centre of the poppy-head, with wings, the other two angels coming out at the side, with wings flowing off into the bench end. There were some of these poppy-heads with foliage not rounded off, but carved or cut as if it had been done with wood only an inch thick instead of four inches. The other side of the poppy-head was also carved flat, and the ends were carved with a small bit at each side cut through, the square edge of the outline being preserved. He much preferred the earlier work to the more elaborated. Take some crockets at Ely. They were like broccoli cabbage, withered and dead, representing nature in its decay, what one would see thrown out of the vegetable market. Foliage should be studied from the living and growing, not the withered and dead. To begin with, the main lines should have life. Look at the common fern growing; how it shot up, springing from its root with an almost straight line, yet not such a straight line that might be drawn with a set-square—just such a line that could not be described, but only seen and felt. How suddenly it ran off into a scroll, day after day unfolding itself, not making a dreamy curved line, but growing; like all living things, it meant to live. That was the principle he endeavoured to put into all the carving entrusted to him. Still keeping to the value of the decided line, with life and go, because all carving depended on this: all lines that could be described with a T-square, set-square, compass, or that could be conveyed verbally or by instructions to any given size or radius, were strictly architectural. But he thought they should never be used in designing carving. He desired to leave carving for a moment, and to show what a line could do and what nature had provided for before the simple square, circles, and so-called line of beauty. He might say that he strongly objected to the line that had been called the "line of beauty"—that was, Hogarth's line of beauty. It was too sleepy; it seemed to have been described with a compass, with a radius at each side, and joined in the middle. A line that had beauty must show life and go. Nature always furnished lines that really could not be described; they changed so suddenly and subtly. If they looked at a Japanese screen, they would see what wonderful things could be done with a line. He illustrated this by means of the "hand line." Nature, he believed, suggested everything to the old masters. He was looking at some trees recently planted in the Leazes Park, and seen against the evening sky, they formed in appearance perfect finials and crockets. Some

beautiful foliage, in wood carving, was spoiled in the design by showing the end of the stem. The end should be tucked in, or lost behind the leaves. In some of the old work there had been a strong effort to make the branches and stems as natural as possible, with the leaves conventional. This he held to be the wrong way. In cases where the foliage was running round the caps, the stems could be shown prominent; but the end of the stem should be hidden by all means. Rules and laws cramped art, at least in decoration. Make a rule, and art would invariably cease. It could not be confined; it must have freedom. The distinct characteristics, however, of the style of architectural ornament, Classic or Gothic, might be adhered to, but without carving every piece exactly alike year after year. Here individuality should exert itself. The schools of art all over the United Kingdom during the last two decades had helped to remove much of the old conventional methods and rules, and to spread a healthier taste. What could pass muster twenty or thirty years ago would not be tolerated now. There were the panels in sideboards, with carved dead game hung up by their feet, tied to a most realistic nail, all most elaborately worked in alto-relievo. Then there was the everlasting bunch of grapes, also in alto-relievo, also tied to a nail with a piece of string. Mirror frames were decorated with dead game and fruit, just "chucked" on—he could find no better word to express this now, he hoped, defunct manner of decoration. At that period everything was marked by a distinct absence of design or motive. Carpets and wall-papers were not treated in a flat design, but with deep shadows, the foliage standing up, so that people, until they got used to it, had to lift their feet carefully for fear of being tripped up. The wall-papers had anything but a flat surface in appearance. Some people had an idea that carving should be smooth and polished and bright, others that it should be hard and sharp. A very common idea was that good carving might be judged by feeling it with the fingers, that it ought to be cutting and prickly to the touch. He maintained that carving should be neither, yet both. It should be crisp in parts, it might even be smooth in parts, or it might be hard and sharp; but it ought to be art, and done with power, delicacy and feeling. A carver with the advantages of education, knowing the style of decoration, its position in relation to architecture, the art temperament would soon tell him where power, strength, delicacy or high finish were required. Time spent in highly finishing every part of a piece of foliage was very often worse than lost. He had seen a great many instances of this by carvers of high repute, whose work looked as if it had been cast out of an old worn-out mould, and had much the appearance of putty. There was as much art in knowing where to stop as where to begin. In conclusion he desired to give them his view on colour decoration. He held strong views on that point, and, with their permission, he would venture to ventilate them. Of course he referred only to wood carving, not flat or plain surfaces. Take, for instance, the plain petal of a tulip. It was striped with colour; also the flat pansy; but the rose and other delicately moulded flowers were of a gentle blending of one colour. Gilding carved oak was the only form he could bring himself to relish. This, if done properly, showed all the grain of the wood and all the crisp tool marks, and looked what it was—a gilded carving. The carving should be coated two or three times with size before gilding, not painted and gilded. Some had the idea that to prepare a carving for gilding it should be coated two or three times with paint or whitening, then sand-papered and smoothed down, with a few scratches here and there to give effect, and this, also, looked like gilded putty, and not like what people would have others believe solid gold. Everything ought to look like what it was; therefore, if a carving was to be gilded, let the wood assert itself. When oak must be decorated with colour, he thought stains should be used for the grounds or fields, with the design or pattern painted upon it. He had seen a carved reredos so decorated that all the projections and shadows were lost; it might have been painted on a flat board. He expected they would say the old masters decorated their carvings. He had seen foliage painted a subtle green, with yellow flowers, and he would admit that he was taken with it. But how much of the effect was due to age he was not prepared to say. He knew that two-thirds of the paint had been worn off, showing the oak here and there with advantage. He questioned whether it would look so well when new. Time, the softener of all things, had done its part in dealing with all the old masters. In coloured decorations colours always got lower in tone. The crude blue three or four hundred years old became yellow; so also with the reds, making the mellow colour we so much admired. Time was not the only softener of wood carving. Old oak chests, buffets, panellings, chairs, &c., could in some parts of London be made to order. After the old furniture was made and carved, it was scraped with a wire brush, to take off the hard edges. The wire brush removed the soft part of the grain of the wood. Thus was done in an hour what would take a century and a half to accomplish. The furniture was then fired at with dust shot out of a gun, and the

small holes so caused were filled up with dust from worm-eaten wood. The whole was then stained very dark with liquid ammonia or fumigated. The collector was very often deceived with this. He generally canted the piece of furniture on one side, tapped it with his hand, and if dust came out of the shot holes he thought it was an old and genuine article. He had seen all this done, but as a rule the makers of old furniture missed something. He had seen a very good imitation of an Elizabethan cabinet, with the exception that the iron hinges were put on with screws. If they had used wrought-iron nails, and clenched them at the back, it might have passed. But Brummagem nails were rather too modern. Henry Blackburn, in speaking of some old woodwork in Normandy and Brittany, said it was held together with nails all clinched at the back, intending that it should remain. He said, further, that screws always suggested that they could be taken away with a screw-driver, but that work fastened with good strong wrought nails could not be removed without breaking and destroying the work. The old masters were not always correct, especially in their costumes and accessories. He remembered once having to design a St. Jerome. He had his own idea of the costume, but the architect questioned his authority, and said the old masters were right. The old masters dressed their saints in garbs of their own time, and he said that if they were right, he was justified in dressing his St. Jerome in a frock coat, and if he wanted, with a high hat and umbrella. They had now every opportunity of research in architectural museums, of which they should take every advantage. In art, no one could begin where another left off. Could anyone build on such structures as the old masters had left? No. They could not pile up on the top of other men's work; they must make a foundation of their own, and build upon that.

THE NATIONAL GALLERY.

THE annual report by Sir Frederick Burton on the National Gallery for the year 1893 has appeared. It states that the pictures which have been purchased out of the Parliamentary grant in aid and out of the Clarke bequest during the past year are seven in number, and consist of *Soldiers Quarrelling over their Booty and Players at Tric-Trac*, both by Duyster, bought for 1,250*l.*; *View on the Shore at Scheveningen* (Ruysdael), 3,045*l.*; *Portraits of Mr. and Mrs. W. Lindow* (Romney), 735*l.*; *Beatrix Knighting Esmond* (Egg), 105*l.*; *The Cast Shoe* (Mason), 682*l.* 10*s.*; and *Chilston Lane, Torquay* (Willcock), 50*l.* The bequests and donations to the gallery include *A View in Hampshire*, by Nasmyth; *The Harbour of Refuge*, by Walker; and *Christ Washing St. Peter's Feet*, by Ford Madox Brown. Three pictures by Sir Joshua Reynolds belonging to the Dilettanti Society, viz. two portrait groups and a bust portrait of Sir Joshua Reynolds, which had been on loan in the National Gallery since 1886, were reclaimed by the Society in April last.

The trustees and director renew the appeal which they made in last year's report respecting the urgent necessity for erecting additional rooms at the National Gallery. The acquisition of fresh pictures annually increases that necessity. In the absence of adequate wall space, the only possible mode of providing accommodation for the works in question was the use of hanging screens. But this expedient has now reached its utmost limit, and if the present system of classification is to be maintained there is absolutely no more room available. The Government intimated the intention of devoting to the extension of the National Gallery buildings a portion of the site now occupied by St. George's Barracks as soon as the soldiers' quarters have been transferred to Millbank. But some years must necessarily elapse before the new barracks can be built. In these circumstances, the trustees and director call attention to a suggestion made in the last report, viz. that at least a portion of the present barrack drill-ground should be given up at once for the purpose required, and that the National Gallery should be enlarged without further delay.

The gallery was visited by 486,746 persons on the public days during the year, showing a daily average attendance on such days (207 in number) of 2,351. On students' days (Thursdays and Fridays) 38,976 persons were admitted between January 1 and December 31, 1893; the admission fees (at 6*d.* each) amounting to 974*l.* 8*s.*, as compared with 1,048*l.* 14*s.* received in 1892. The amount annually realised by admission fees is devoted as an "appropriation in aid" of the Parliamentary vote to the National Gallery.

The total number of students' attendances at the National Gallery on Thursdays and Fridays throughout the year was 20,936. Independently of partial studies, 971 oil-colour copies of pictures have been made, viz. 402 from the works of 87 old masters, and 569 from the works of 49 modern painters.

Among the foreign artists copied Greuze takes precedence, for his *Girl with an Apple* was copied sixteen times, and his *Head of a Girl* eleven times. Romney holds a similar rank among the moderns, for his *Parson's Daughter* was copied nineteen times and his *Lady Hamilton* fifteen times.

THE CAVES AT MENTONE.

IN a communication to the *Scotsman*, Mr. J. E. Somerville writes:—Much has been written about the Mentone caves, and yet their interest is by no means exhausted. Two years ago the scientific world was startled by the announcement of the discovery of three prehistoric skeletons in the Barma Grande, the deepest of several caves in the Baoussé Roussé—or red rocks—which form the eastern or Italian side of the Bay of Mentone. The skeletons were lying side by side, at a depth of 24 feet beneath the original soil of the cave. All were above ordinary stature, and one was gigantic, measuring as nearly as can be estimated 7 feet. The skulls were of the dolichocephalic or long-headed type, and were remarkable for their large facial angle, good frontal development and square orbits.

Three weeks ago, in removing soil from the cave for his garden, the owner of the quarry came upon another human skeleton. This time precautions were taken and several scientific persons, among whom were Mr. Arthur Evans and Mr. Drury Fortnum, V.P. of the Society of Antiquaries, London, were present while it was being unearthed. This was done with great care and occupied many hours. The present find lies 13 feet further in the cave than the former skeleton and at a level of 6 feet above them—that is to say, 19 feet below the original floor of the cave. Ten inches of soil had been removed, consisting of burnt earth and the remains of charcoal hearth, which I had seen some weeks before. Above the middle of the body lay a large stone 28 inches by 27, 7 inches thick, rounded above and flat below, which suggested the idea of a small dolmen. This, however, it was not. One cannot be certain whether the stone had been placed there at the time of the burial or had fallen off the side of the cavern. Between the stone and the skeleton was about 6 inches of earth, in which were many bones of birds and the jaws of rodents (*arvicola*) of several species, and the stump of a deer's horn (*C. elephas*) with a piece of the skull attached.

The skeleton lies along the eastern side of the cave, with its head towards the opening; those of two years ago lay across the cave, with their heads to the eastern wall. It lies, like them, on its left side, in a somewhat curved position; the right leg crosses over the other at the tibia, the right arm is extended outwards, the left is bent up towards the head. The skull, which had been broken by the pick, is of the same type as the others, with broad, high forehead, strong jaws and pronounced supraorbital ridges and square orbits. The face is broad, measuring 5½ inches between the upper external angles of the orbits. All the teeth, including the wisdom teeth, are present in sound condition, but with the crowns much worn down. So we infer the individual to have been a man past middle age. Near the back of the skull a small flint knife was found, 4 inches long, and a minute carved bone ornament like a button. Round the head lies a row of shells of *Cypræa*, 1½ inches long, decayed so as to be unrecognisable. Beside them are a number of the canine teeth of deer, pierced through the sides. On the middle of the forehead, and adhering to the skull, are a number of small shells of *Nassa neritæ*, pierced in similar fashion. The shells and teeth evidently formed necklaces or chaplets. It is interesting to find these canine teeth of the deer employed for decorative purposes. The North American Indian of to-day whenever he kills a wapiti immediately draws the four canine teeth, and treasures them as charms. The prehistoric cave-dwellers seem to have had similar ideas. Only a small particle of ochre was found about the skeleton. This substance was spread in great abundance under and around the skeletons formerly discovered. Indeed, they seemed to have been laid in a kind of hollow lined with this substance, which has quite discoloured the bones. It is thought that the ochre was buried along with the corpse that in the other world the owner might have material wherewith to paint his body, as the Kaffirs do at the present day. In the middle of the breast, below the chin, and at the extremity of the left hand, lay a large natural crystal, 3½ inches long, of carbonate of lime, such as are common in the rocks around. From its position it is inferred that it served some superstitious or religious purpose. From the presence of these things, as well as from the flint implement buried with the dead, we get faint glimpses of the religious notions of these ancient cave-dwellers. Like all the other skeletons that have been found in this cave, this one is of large proportions. The individual probably stood 6 feet 2 inches, though it is difficult to estimate the height exactly. The femur is 18 inches long; that of the giant found here two years ago is 20½. I managed with some difficulty, and with the aid of magnesium light, to take a photograph of the figure as it lay. The breadth of the face is well brought out in it.

For some weeks the workmen have been digging down to find the rock-floor of the cave at its mouth, and have run a mine into the soil. They are now working at a depth of 22 feet below the level of the skeletons; that is to say, 40 feet beneath the surface of the soil before excavations were commenced, and yet the rock has not been reached. The earth is full of the

bones and teeth of animals. Already there have appeared those of the woolly rhinoceros, cave hyæna, fossil horse, and the tusk and huge vertebrae and pelvis of an elephant or mammoth. Of the last, 2½ feet are visible, and the acetabulum, or socket for the head of the thigh, measures 9½ inches in diameter. Both above and for 18 inches below this bone are lines of charcoal, evidence of the early hearths of human beings who in all probability feasted on this elephant. The bone shows indication of having been partly burned in roasting. Lying beside the vertebrae of the elephant was a fine flint implement, 4½ inches long and 2½ wide, with a sharp-cutting edge, and with one of its sloping sides flatter than the other, as if to be held in the hand between the fingers and the ball of the thumb. Mr. Evans said it resembled the type of instrument now or but recently employed by the Maoris of New Zealand for cutting notches in the stem of a tree they wished to ascend.

In the cave no metal has been found, nor any vestige of pottery, nor is there any weapon of polished stone. Though the ornaments around the skeletons and the bones near them seem to point to a Neolithic race, the tools are all of the chipped order, and indicate an earlier age, one for which Professor Issel, of Genoa, has invented the name of Miolithic. But who were the men that ate the elephant, and who have left the traces of their fireplaces so well marked in the deep soil, and of what race was the man that used the flint tool found beside the elephant's vertebrae? Assuredly Palæolithic. The whole soil of the cave is full of bones, entire or split for the extraction of the marrow. In the upper strata they are mostly of species used for food, *Bos primigenius*, *Cervus* of three species, ibex, boar, &c. Lower down they are mixed, herbivorous and carnivorous. Throughout the soil fragments of flint are very numerous, though perfectly-formed tools are not plentiful. In the lower strata the chips are larger and coarser than those of the upper beds. So numerous are the flakes and cores that the cave would seem to have been used for a long series of generations as a manufactory of such implements. The material was probably derived from beds which are found not far off on the hills above, near which ochre is also found. The flint occurs in two kinds of places—sometimes embedded in the hard conglomerate, a thick stratum of which runs parallel with the coast; sometimes lying loose in a sandy, calcareous soil, in which it appears to have been segregated.

CIVIC ARCHITECTURE.

LECTURE was given by Alderman P. H. Rathbone before a very large and crowded audience at the Picton Lecture Hall, Liverpool, on "The Public Buildings of Liverpool and other Great Cities of the World." In the course of his lecture he said:—

The importance of cities having really fine buildings is very great, but I don't think we in England sufficiently realise it. To the city in which it is situated a really fine building is a permanent source of wealth. In the first place, it is a public announcement that round it are grouped an intelligent and industrious population, who had the power and sense to build it. A great public building is not only a source of wealth, but a bond between all classes. Unlike a book or a great picture, it cannot be the work of a single man. The genius of the architect requires the assistance of great and varied skill. Such a building has an element of permanence which is of great value to the prosperity of a city. Most great cities have understood this, and those which have not have practically passed away. Antioch was larger and richer than Athens, but how different has been the influence of the two cities. It is a discussion where Carthage was situated, while Rome is still one of the great cities of the world. The poorest citizen feels that a great public building belongs to him as well as to the richest and most powerful of his fellow citizens. The artisans feel that they made it; they helped, they or their forefathers, to pay for it. Therefore they are proud of it—are proud of being citizens of the town which has raised it. As Englishmen, we are proud of the Houses of Parliament. We compare them with the Chamber of Deputies in Paris, and we feel their noble architecture to be a proof that we are proud of our Parliamentary institutions, with their long history and unbroken power. The Parisian is proud of being a Parisian. Paris believes in Paris, and therefore it is that the Town Hall of Paris, not the Chamber of Deputies, is the great building of their city. They spared neither expense nor genius nor energy in making their Town Hall the finest in the world. If you would inquire which cities in England have most life and vigour, you will find them to be those which are raising noble public buildings to declare their present prosperity and insure their future duration. But this cannot be accomplished without the aid of educated artisans. It is therefore the duty of the city to secure the education of those classes of artisans necessary to insure architectural success. I think we too are

awakening to this.* We are about to establish schools for those arts connected with the mother of them all—architecture; and when they are established I hope the city will be enabled to assist in finding employment for their students. It is very sad to think of the amount of genius in our nation which we know to have been wasted and lost through the absence of opportunities, genius which would have tended to make our nation greater and nobler than it is. However great the genius of an architect may be, he requires the earnest and enthusiastic help of his fellow citizens. Architecture is a national branch of art as distinguished from individual branches. The lecture was illustrated by numerous lantern pictures of famous buildings throughout Europe.

EGYPTIAN ARCHÆOLOGY.

THE following is the third report of the Society for the Preservation of the Monuments of Ancient Egypt; Patron, H.R.H. the Prince of Wales, K.G.; president, the Earl of Wharcliffe:—

In the report presented to the last general meeting of this Society, held on July 14, 1891, the committee were not in a position to do more than give an account of continuous endeavours to carry out the objects for which the Society was formed, without being able to point to any definite success. On this occasion they are glad to be able to show some more satisfactory result of their efforts.

In the report for 1890-91, referred to above, the principal objects for which the Society was striving were stated to be the appointment of an official inspector of monuments and an endeavour to arrest the gradual decay of the Temple of Karnak by means of Grand Bey's scheme for carrying off the inundation water of the Nile.

With negotiations on these subjects still in progress, it was thought advisable to postpone any general meeting of the Society until a satisfactory and definite statement that something had been achieved could be produced.

It will now be a source of great satisfaction to the members of the Society that the first of these two objects has been attained, and that the second is in a fair way to be carried out after many unavoidable delays.

The committee having received no further information with reference to the appointment of two inspectors of monuments, which, as detailed in the report for 1890-91, had been promised by the Egyptian Government, and learning that M. Grébaut had resigned his post of director-general of the Gizeh Museum at Cairo, and that a new director, M. de Morgan had been appointed in his place, and had turned his attention to this subject, addressed a letter to the Earl of Rosebery on September 26, 1892, inquiring whether the promised inspectors had been appointed, and if so, what was the nature of the duties entrusted to them, and on October 20 Sir Philip Currie was good enough to forward to the hon. secretary of the Society a despatch from the Acting British Agent Consul-General at Cairo, detailing the steps that had been taken.

Mr. Hardinge's despatch, communicated by Lord Rosebery's instructions, is as follows:—

Cairo: October 29, 1892.

My Lord,—I have the honour to report, in reply to your lordship's despatch, No. 139 of the 29th ult., that on returning to Cairo I made inquiries of M. de Morgan, the newly-appointed director-general of the Gizeh Museum, respecting the steps taken up to the present for the more efficient protection of Egyptian monuments.

M. de Morgan informs me that the two inspectors, referred to in the letter dated the 26th ult. from the Society for the Preservation of the Monuments of Ancient Egypt, have already been appointed with the title of inspector-general. One of them is a Frenchman, M. Foucard; the other a native of Egypt, named Ahmed Effendi Najib. Each is to have alternate charge for a year at a time of Lower and Upper Egypt: thus, one year M. Foucard will inspect Lower Egypt, and Ahmed Effendi Upper Egypt, and in the following year they will interchange Provinces. Their duty is to visit all monuments and other objects of interest to the Egyptologist in their respective Provinces, and to appoint and superintend sub-inspectors, each of whom is to be responsible for the preservation of the antiquities situated within a given radius assigned to him. Provision has so far been made for twelve of these sub-inspectors. The following are their head-quarters:—Tantah, Zagazig, Medinet-el-Fayoum, Rodah, Akkum, Abydos, Denderah, Gurnah, Luxor, Edfou. By a Khedivial decree of August 1 last they were created "officiers de police judiciaire." This enables them to arrest in case of "flagrant délit," on condition of taking the offender within twenty-four hours before the nearest tribunal. If there is no "flagrant délit" they can draw up a "procès verbal" without further police assistance, and it will be received as evidence by the "Parquet."

I have, &c.

(Signed) ARTHUR HARDINGE.

This may, the committee think, be taken as a very satisfactory result of the efforts the Society had been making for nearly four years to obtain a proper system of inspection, which should prevent the recurrence of such disgraceful mutilations as took place at Beni-Hassan in 1889.

It is, no doubt, to the activity of the new director-general that these appointments are due. M. de Morgan, as will be seen in the sequel, has shown himself in active sympathy with the objects of the Society, and it is at least to be hoped that the measures taken by him will prove effectual in finally putting a stop, as far as is possible over so extended an area, to the various causes of destruction to the monuments which have been in operation for so many centuries; and the Society may, it is thought, congratulate itself on being the instrument by which primarily this reform has been brought about.

As regards the Temple at Karnak, the aims of the Society have been more difficult of attainment. It was considered advisable before taking any steps towards giving practical effect to Grand Bey's scheme, to obtain an independent report on its efficacy for the purpose intended, and, as stated in the report, 1890-91, negotiations to this effect were opened with Lieutenant H. G. Lyons, R.E., who undertook, if his engagements allowed him, to survey and make a general report on the ruins of Karnak, which should give the information required and could at the same time be circulated to interest the public in the scheme. But Lieutenant Lyons's duties lying higher up the Nile, at Wady Halfa, he was unable to give the time to the work. Under these circumstances Colonel Ross, the head of the Irrigation Department at Cairo, was applied to, and he most kindly made a careful survey and sent a report, accompanied by a sketch-plan and sections, detailing the condition of the various parts of the temple as affected by the incrustation of salt and the movements of the inundation water through the ruins, and showing that Grand Bey's scheme for carrying off the water by a canal would not be practicable on account of certain differences of level which had not been taken into account. Colonel Ross proposed, therefore, that a small steam-engine should be set up to throw the water to the necessary level; it could then be carried away to the Nile by a channel to be dug for the purpose. This report was accepted by the committee on May 24, 1892, and Colonel Ross was asked to supply a detailed estimate of the cost of the proposed engine and other necessary works.

Unfortunately, at this time Colonel Ross was obliged to give up his appointment as head of the Irrigation Department and leave Egypt on account of ill-health; and the committee consider that the thanks of the Society are due to Colonel Ross for the great trouble he took to survey the ground and prepare a report at a time when he was seriously out of health, and burdened with his departmental duties.

On the advice of Sir Colin Scott Moncrieff, who, at the time that he occupied the post of head of the Public Works Department in Cairo, took an active interest in the affairs of the Society, Major R. H. Brown, of the Irrigation Department, was asked to continue Colonel Ross's work. Major Brown being in England, attended a meeting of the committee on September 6, 1892, and kindly undertook to act in the Society's interests at Karnak in carrying out Colonel Ross's method for washing out the ruins. Major Brown, on his first visit to Karnak, immediately after his return to Egypt in September, being fully occupied with the "High Nile," could do no more than send his impressions, which were that some modification was necessary in Colonel Ross's scheme; subsequently, on a second visit in July of last year, he sent a detailed report, made after a very careful survey of the ruins. Major Brown's report has been printed, and is circulated to members of the Society, together with this paper; it is therefore unnecessary to go into details, but it will be seen that Major Brown's object is to prevent the periodical wetting and drying of the bases of the walls and columns, which has been the cause of the gradual undermining which has gone on for centuries, and has brought down many of the columns. If, as is to be believed, Major Brown's scheme is successful (and he seems confident that all will be ready for work during the inundation of 1894), the second main object for which the Society was originally started will have been achieved, and the most magnificent group of ruins in the world, which M. Maspéro is said to have stated could only be abandoned to their fate, will be saved from further decay. A photograph which Major Brown presented to the committee shows that the engine will be placed in an inconspicuous position outside the general mass of the ruins.

The cost of the proposed arrangement was estimated by Major Brown at about 500*l.* for the engine and necessary works for placing it and for conveying away the water, and about 200*l.* a year for keeping the engine at work; but a further sum of 600*l.* would be required to make a permanent building for the engine and for a masonry or iron duct to replace the earth trench for carrying off the water, his object being to keep down the cost until two or three years' experience had proved the satisfactory working of what might be somewhat in the nature of an experiment.

Major Brown's report and estimate were considered at a meeting of the committee on August 1, 1893. The committee felt that they were not in a position to take the permanent charge of working the engine, as it was impossible for them to

guarantee an annual outlay of 200*l.* in perpetuity, and after some discussion the following resolution was adopted unanimously:—"That the committee adopt Major Brown's report and estimate for fixing up and working an engine at Karnak, and are prepared to provide the money for the placing of the engine on the estimate given; and will also provide the money for working the engine for two years, on the assurance that the expenses for continuing the work after that period—that is, the permanent working of the engine for keeping down the flood-water—should be provided by the Egyptian Government, and that if his proposal be agreed to by M. de Morgan, the committee will communicate officially with the Egyptian Government."

It was the greatest satisfaction to the committee to find that M. de Morgan, in a letter which is printed in Major Brown's report, cordially fell in with the Society's views and accepted their assistance, and that he fully agreed with Major Brown's method for keeping down the Nile inundation water, putting his staff at Major Brown's disposal for the execution of the works; and on December 1, 1893, M. de Morgan wrote again that he approved of Major Brown's proposals, and, in answer to the resolution of the committee which had been forwarded to him, that he had "submitted the question to the archaeological committee, being unable to make any engagement for an annual expenditure of 200*l.* for the future without having first received a special authorisation on this point," and that "the committee having approved this expenditure, and having directed him to come to an understanding with the hon. secretary as to the ways and means to be employed for putting the project into execution," he is able to give the authorisation necessary for going on with the work, no application to the Egyptian Government being necessary; and further that he will arrange with Major Brown for a meeting to definitely settle the commencement of operations. On this letter being read to the committee at a meeting on December 20, 1893, Major Brown was authorised to proceed with the work at Karnak as provided for in his estimate and report. A letter subsequently received from Major Brown on January 6 of this year, states that he will proceed at once to make arrangements with M. de Morgan, as everybody is agreed as to what is to be done. He strongly advises at the same time that the permanent form of engine-house and the permanent masonry or iron duct should be made at once, rather than at the end of three years (as then proposed), so as to make a complete job of it, and hand over our gift at the end of the two years in a complete form to the Egyptian Government.

To meet these expenses the Society has in hand about 424*l.* in Cairo, and a balance of about 230*l.* at Messrs. Glyn, Mills & Currie's bank, and it will be necessary to appeal to the public for further funds. It is important to note on this point that since the general meeting in July 1891 no efforts have been made to collect fresh funds, and that those members of the Society who had promised annual subscriptions, and have paid them irregularly or not at all, have not been appealed to. It is obvious that until the committee were certain of being able to carry out their wishes with regard to Karnak, on which the original appeal to the public was made, it would not have been fair to collect further sums. Now, however, that all difficulties have been smoothed away, and that the delays which, as will have been seen from this report, have been unavoidable are pretty certainly at an end, a call will be made for promised annual contributions, and a circular will be sent round to members to that effect. Meantime, the thanks of the committee are due to those subscribers who have continued their annual payments—their money will certainly be used to good purpose.

A letter from Sir Colin Moncrieff, dated Cairo, December 9, 1891, was received, in which he drew attention to the perilous condition of the Great Rock Temple at Abu Simbel, well known by the four colossal figures of Rameses II., which overlooks the Nile. An alarming report had been received by him that the whole ledge of rock overhanging the left-hand statue "has advanced forward, and 270 cubic metres of rock are displaced from a half metre to three metres, the temple being in imminent danger," and estimating the cost of preventive measures at 1,000*l.* Sir Colin, after consulting with General Grenfell, decided to ask the Society to devote the 500*l.*, which were in the hands of the treasurer to the Society in Cairo, towards works for arresting this dangerous displacement. This letter was read and discussed at a meeting of the committee, held on January 6, 1892, and it was resolved to telegraph to Sir Colin Moncrieff that the Society placed 250*l.* at his disposal if the Egyptian Government would contribute a like sum. It was thought that 500*l.* would probably be sufficient to stave off immediate danger, and that the Egyptian Government, having at that time ample funds at their disposal, would be in a position to carry the work on to its completion. A letter was also written to the same effect to Lord Salisbury, asking him to communicate the Society's proposal officially to the Egyptian Government. On February 2 the gratifying announcement was forwarded by Lord Salisbury that "Captain Johnstone and a party of sappers would proceed at once to Abu Simbel to

conduct the works necessary to insure the safety of the colossal statues," and that the Egyptian Government would provide the necessary funds, and will not find it necessary to utilise the 250*l.* offered by the Society. Sir Colin wrote in May that the work entrusted to Captain Johnstone and twelve English sappers had been carried out with complete success, at the cost of 420*l.*, which the Egyptian Government had paid.

About the same time Sir Colin Moncrieff, whose continued active interest in the affairs of the Society while he was head of the Public Works Department in Cairo cannot be too highly esteemed, wrote proposing that the Society should spend 68*l.* in enclosing and otherwise protecting a valuable and interesting pavement, discovered by Mr. Petrie at Tel-el-Amarna. It appeared to the committee that this was a work which came well within the functions of the Society, and Sir Colin's proposal was approved; and in May Sir Colin wrote that the protecting roof and enclosure had been completed, at a cost of 81*l.* 1*s.*, under Major Brown's superintendence, with possibly a pound or two more to spend. This expenditure leaves, as has been stated, about 424*l.* in the treasurer's hands at Cairo.

Meanwhile, the preposterous scheme for forming a lake or reservoir at Philæ was not forgotten, and some communications passed between the committee and the Foreign Office on the subject. In December, 1891, a letter from Sir Ed. Baring (Lord Cromer) was courteously forwarded to the hon. sec. from the Foreign Office, in which he expressed his hope and belief that means will be found to improve the water-supply of Egypt without having recourse to the plan which involves the submersion at Philæ; and a promise was given that the earliest information should be afforded the committee of the appointment of the intended International Commission of experts who were to consider the question. It being understood that nothing would be undertaken until this Commission had thoroughly examined into the numerous schemes for storing the water of the High Nile, it was decided to put off for the time the preparation of a public memorial to the Khedive, which had been decided on by the committee. A recent telegram in the *Times* shows that the Philæ scheme has not only not been abandoned, but has been prominently put forward with the approval of M. Garstin, who has succeeded Sir Colin Moncrieff as Under-Secretary for Public Works in Cairo. The hon. secretary has applied for information to Lord Rosebery as to whether the promised commission will be appointed to consider this barbarous scheme before anything is decided upon, or whether the matter rests with M. Garstin to decide. In any case the committee are prepared to take all steps possible to protest vigorously against so outrageous and wanton an act of destruction.

The committee have again to thank the Marquis of Salisbury and the Earl of Rosebery for their courteous communications on this and other matters, and for the full information supplied on all points on which the committee have had occasion to make inquiries.

Sir Colin Moncrieff, having left Egypt for good in the summer of 1892, announced to the committee at a meeting in September, that he must resign the position of hon. treasurer to the Society's fund in Egypt, which he had kindly undertaken, and suggested that Major Brown be asked to succeed him. Major Brown, who was present at the meeting, expressed himself willing to undertake the duties, and he was appointed hon. treasurer in Sir Colin's place.

The names of Prof. J. H. Middleton, Major R. H. Brown, M. de Morgan, Mr. Percy E. Newberry and Mr. Vincent Robinson have been added to the committee since the last general meeting. The death of Sir William Gregory has deprived the committee of the services of one who took great interest in the affairs of the Society. His last attendance was on June 6, 1892.

The financial position of the Society is satisfactory. The money in hand in London and Cairo for the special fund amounts, as stated above, to over 655*l.*, so that the first expense of setting up an engine at Karnak is provided for. The administration fund shows a balance of 39*l.* 14*s.* 7*d.*

Appended are the statements of the hon. treasurers to the Society and the lists of the committee, &c. and other members, and of the subscribers to the special fund.

THE YORKSHIRE COLLEGE, LEEDS.

THE new College Hall and Library and the Medical School, which are being erected by the Council of the Yorkshire College, are rapidly approaching completion. Both are Gothic in style, and will form important additions to the college buildings. They were commenced in 1891, and it was intended that they should be opened in June by the Duke and Duchess of York, but the opening ceremony has been postponed till September. The existing Medical School was established in 1831, and in 1884 the building was purchased by the Yorkshire College, with which the school was then amalgamated. The

number of students at the present time is about two hundred, but the accommodation is inadequate. In the new building there will be ample space for double that number. The school has been erected on the most approved lines, members of the committee having visited most of the medical schools in the country in order to learn what are the best features of each, and these have been adopted in the internal arrangements. The total cost of the site and building will be upwards of 45,000*l.*, and about 18,000*l.* of this sum still remains to be raised. The school has been erected at Mount Pleasant, near the General Infirmary. The building is arranged on three sides only, leaving a large interior court, but allowing of extension on the fourth side if necessary. The college hall and library, the architect of which is Mr. A. Waterhouse, form a central block of the college buildings in College Road, and will cost about 20,000*l.* Hitherto the lecture-room has been used for meetings, and it has been necessary to hire the town hall or some other public building for examinations. The new college hall will serve for both these purposes, and will seat nearly a thousand persons. In a few weeks will be commenced the erection of a fine arts building in connection with the textile department. The estimated cost is 2,000*l.*, which will be defrayed by the Clothworkers' Company. When this building and the college hall and library are completed, the whole of the College Road buildings and site will have cost about 117,000*l.*, of which 35,500*l.* will have been contributed by the Clothworkers' Company; the remainder (except about 10,000*l.* which has still to be raised) has been contributed by the founders and supporters of the college. Altogether there are in the blocks of buildings in College Road 68 rooms used for teaching purposes. In a report which has recently been prepared by the registrar for the Education Department it is stated that the teaching staff comprises in the departments of arts and science 12 professors, 23 lecturers, 16 assistant lecturers and demonstrators, and 11 other assistants—total 62. The department of medicine has 5 professors, 10 lecturers, 6 assistant lecturers and demonstrators, and 4 other assistants—total 25. Last session the number of students in the college, exclusive of medical students, was 901. A day training college for elementary teachers has recently been established as a branch of the college work. Twenty-five male teachers are undergoing training during the present session, the maximum number receivable being 50. The standard of education required for admission has been put somewhat high, candidates having to show that their preliminary education fits them to pursue one of the requisite courses for a University degree. The college has undertaken a very large amount of extension work in all the Ridings.

AUSTRALIAN ARCHITECTS.

IT is impossible to dissociate the unpopularity of the profession of architecture in these colonies, says the *Building and Engineering Journal*, from the blundering and in other cases even the dishonest action of architects who in many cases have even laid bare to the builders the drift of their own aims. It matters not in which direction one turns, there may be found evidences of cruel waste of money, ill-advised construction and hideously-disguised design. In a provincial city which has made great strides in artistic work, which has its art gallery and beautiful statuary in its public places, may be found cathedral "ruins," upon the erection of which some seven or eight thousand pounds have been expended. In a survey of this work we find concrete foundations for a large portion of the building, a crypt in which massive and solid blue stone masonry of finely-chiselled columns and ornate capitals is intermingled with Waurn Ponds stone, and in this partly-finished crypt and these concrete foundations the outline of a structure which would exceed in magnitude either one of the metropolitan cathedrals. Now the building of which these remnants form a part was designed in a competition and was picked from among sets of drawings which provided ample and well-designed and inexpensive accommodation. That which has been commenced at such enormous outlay could not be finished under an expenditure of some hundred thousand pounds, and towards the erection of which on this well known account subscriptions are not now forthcoming. Towards whom is the contempt and indignation of the public turned in such a case, except towards the perhaps unfortunate and in other cases the wilfully misguiding designer and architect? It is but another case to illustrate the wickedly distorted competition system, a system which, even in the hands of the New South Wales Government, has been brought into extreme contempt in the matter of the Rossville Asylum. Tempted under the conditions to produce a fine picture, an imposing perspective, and "estimating" the cost at perhaps less than half the real expenditure for the building, the architect is selected. There are not proper detail drawings, no binding specifications, no safely calculated estimate by reliable builders, and so the slipshod work is commenced and huge sums of money are sunk in initiatory work. Where concrete or brick and cement would

have served for substantial backing there may be found vast blocks of solid masonry, a waste of principal moneys and a yearly loss of interest which would represent a permanent stipend, or a still more useful benevolent fund if properly invested for that purpose. Apart from this the present loss of interest is serious; the works must remain at a standstill for many years, wasting and depreciating under weathering influences, whereas if the 7,000*l.* were invested at compound interest it would be aggregating in a few years a large sum and always inviting increase from donations, which under existing circumstances appear to would-be donors to have no finality. For this the architect is perhaps not to blame, but his advice should always be honestly given so that the sum expended should be so disbursed as to give the earliest possible return in available accommodation, instead of in a portion of the structure which can have no possible value until the whole be completed. It is in such matters and in the cost of the building that professional knowledge should be used to restrain wasteful expenditure instead of a contrary influence being exercised. We may take another ecclesiastical building in the same neighbourhood and inquiring into the details of its construction ascertain that girders imported by a certain firm have been specified. The builder seeks to obtain them from a reputable and metropolitan foundry, points out that they will be far stronger and cheaper, but is told that only the specified firm must be dealt with. The girders supplied are found to be too small; larger sizes are then about to be ordered, but the builder again appeals for the use of the locally made girder, and is told again that he must go to the one importing firm. The girders are so ordered, and when they arrive, much to the builder's surprise are marked plainly as from the aforesaid "foundry," but are charged at many pounds per ton higher than the invoiced price of the same local founders to the builder. Now what inference can possibly be drawn from work like this? What interest can the architect have in making his client pay this extra cost of obtaining goods through a second firm? Appealed to, he explains to the builder, "Oh, I suppose they sometimes exchange stocks," but the local foundry proprietaries are not responsible for the extra price charged upon their girders by the importing firm whom the builders were compelled by the architect to deal with. There can be but one fair course in such matters, and that is the exposure of all such transactions which are bringing an honourable profession into contempt and distrust, and seriously damaging the prospects of those who have ever striven to maintain a high standard of work on perfectly honourable dealings. If there be any line of conduct worthy of special exposure, it must be that which would induce an architect to take "tip" from the supply merchant, when his best services should be at the sole command of his client. There have already been several charges against architects in high positions in these colonies, and many unproved assertions, but it should be to the interests of each to expose and discourage every matter which can possibly indicate even a suspicion of dishonourable conduct. The present dull time is an excellent opportunity for the purification of the profession, and only the fittest should survive the present ordeal of adversity. The fittest should be those whose conduct has ever been above suspicion.

ITALIAN ARCHITECTURE.

A LECTURE on the Italian Renaissance, the sixth of the series, by Mr. William J. Anderson, A.R.I.B.A., was delivered in the Corporation Galleries in connection with the Glasgow School of Art. In continuation of the subject of the last lecture, "The Culmination of the Renaissance," its effects in Venice and the North were discussed, and it was shown to be directly the result of Roman education and bias on the part of its architects. It was a mistake to speak of a Venetian Renaissance school; there were in fact several. The Lombardic school, complete in itself, preceded this central Roman period of Sanmichelì and Sansovino. Palladio of Vicenza and his pupils formed a third distinct variety, while even the seventeenth-century architects did much that was on different lines from any previous work. The chief part of the lecture was occupied by sketches of the lives and works of three of the leading artists and architects of the time (1506-50)—Peruzzi, Sanmichelì and Sansovino. The work of the first-named is characterised by breadth, beauty of proportion, the delicacy and purity of the moulding profiles, and the care bestowed on every detail, nothing being executed at hazard. There is little on a grand scale which attests his power of composition, but by the talents and care he bestowed upon the simplest habitation his artistic capacity is proved quite as much as if his own St. Peter's had been carried to a successful issue. It was in fortification building, remote as may seem its connection with art, that Sanmichelì developed the vigorous simplicity of style which afterwards distinguished him as an artist, tending perhaps to excessive love of mere bigness and extreme severity.

His powers of invention were particularly great, and he left his mark on Venetian architecture to the latest period. These two were in architecture the originating geniuses, and Sansovino, the famous sculptor, was imitator now of one and then of the other. Nothing shows this more clearly than the Mint and Library at Venice, both by Sansovino, the former in a distinctly Sanmicheli manner, while the latter is of a totally different character, and influenced most by Peruzzi's Villa Farnesina at Rome. Generally the culmination of the Renaissance is a great fact in architectural history, and a period quite worthy of comparison with the Periclean age in Greece, the Augustan era of Imperial Rome, and the climax of Mediæval art in France and England. It would be quite unreasonable to claim that it was superior to Greek or Gothic save in certain points, but being comparatively amenable to modern requirements, it touches us to-day more nearly than either. The lecture was attended by a large number of architects and students.

THE ORIGIN OF CHESTER ROWS.

THIS interesting but difficult subject formed the topic of discussion at the last meeting of the Chester Archaeological Society.

The discussion was introduced, says the *Chester Chronicle*, by Dr. T. N. Brushfield, who said it was probable that in the first instance the name of "row" simply meant a line of houses generally devoted to some particular trade or purpose, but when, or at what period, the name was transferred to the present galleried structures in Chester, he could not say. The earliest instance he knew of the name appearing in any printed work was in "King's Vale Royal," by Mr. Smith, which was published in 1590. The rows were there referred to as "galleries which they call rows." As far as the present galleried structures were concerned, those in Chester were quite unique in England, but there could be no doubt that the same kind of elevated footways covered over with houses existed at Kendal and Bridgnorth. The late Dr. Howson stated that he found something of the same kind in Rome, and he (Dr. Brushfield) observed one at Munich. By a general consensus of opinion the row structure had been attributed to the Roman period on two distinct data—the formation of the streets and the arrangement of the houses. When the Romans first came to Chester they fixed their camp upon the slope passing down to the river, and the four main streets of Chester at the present time represented in a great measure the four main roads from the camp. It had been stated on good authority that these streets were formed by being excavated in the solid rock. In the other parts it was found that the present row level, although generally asserted to be the Roman level, was simply a mass of *débris*, an accumulation of rubbish of several successive centuries. He had three separate data for asserting that the Roman level was not the present row level, but coincident with the present level of the streets—certainly Watergate and Bridge Streets. His own opinion was that the present street level was the original Roman level, and the row level was due to the elevation of the ground by the gradual accumulation of rubbish. At the commencement of the thirteenth century a new style of house was erected which had cellars and crypts for the preservation of merchandise goods. He did not think for a moment that the present row structures could be fairly attributed to Roman origin. One theory that had met with a great amount of support from authors, even including Ormerod, was that the rows were erected for the purposes of defence, more especially against the Welsh. Hemingway thought they were erected as shelters for traders and their goods from summer heat and winter's storms. The rows being erected, they were used for a variety of purposes, including, of course, protection from the weather. Parker suggested that the celebrated rows owed their origin to this circumstance, that in rebuilding the town after the Great Fire, it was found more convenient to make a footway and a sort of bazaar over the shops and upon the top of the vaults or cellars. His (Dr. Brushfield's) opinion was that the rows owed their peculiar construction to two separate causes. First, to the elevation of the site occupied by them, and secondly, to the character of the buildings. No explanation that he had seen alluded to the original existence of those footways simultaneously with the early formation of the streets. One theory that found acceptance was that they were constructed through the first floors of the houses, each inhabitant surrendering to the public good the best portion of the best room of his house. Apart from the improbability of this statement, it had no basis in history or tradition. There were reasonable grounds for assuming that those ways existed from an earlier period, and that their incorporation into the present rows was a gradual process coincident with the slow elevation of the ground in which the present roadways did not participate, and that the crypts extending beneath them were one of the consequences of such elevation, and not the cause. Dr. Brushfield pointed out that some of the projecting tops were self-supporting, whilst others were supported by props of timber.

Canon Morris, D.D., said the earliest mention he had been able to find of the rows, in some records he had searched, was dated 1301. The question arose in talking about the rows, Were not those early rows much the same as Paternoster Row, and other rows in other cities? His opinion was that the order of the building and the formation of the rows was first that shops, small shops, lined the streets; and then, as trade began to increase, there came a better class of shops on the row level; and with the further improvement of trade they built another floor above the house and the shop.

After Mr. E. W. Cox had spoken on the subject, Mr. Henry Taylor said it seemed to be generally admitted that the rows were in existence in Edwardian times. Dr. Brushfield had referred to the views of the late Mr. Thomas Hughes on the origin of the rows. Mr. Hughes modified his views, but at any rate he concurred with Ormerod and Archdeacon Rogers on the possibility of the rows being used as a means of defence, particularly against the Welsh. Both Dr. Brushfield and Mr. Hewitt seemed to agree that the poor Saxon builder could not have had anything to do with the building of those houses and rows. Now in 1862 a number of Saxon coins were discovered in St. John's Church, and Mr. Hughes read an able paper on them. One of the coins was of the date of King Edward the Elder, the son of Alfred the Great, who reigned from 901 to 925. Dr. Brushfield said Chester was restored in 907. Mr. Hughes, describing the coins, said that on the reverse was a "representation of a Saxon house of some pretensions, from which we can glean a notion of the prevailing style of domestic architecture. It appears to be a house of three storeys, the second resembling our Chester rows, with the front to the street supported upon arches, as is still the case in several instances around us." The rows, as rows, must have existed from Edwardian times, and he could not help thinking that the poor Saxon might have contributed in some measure to the general idea.

Mr. Hewitt, who read the first paper on the subject at the previous meeting, said that the figure on the coin appeared to be more like a "casket" than a house. Dr. Brushfield said he thought it more like a massive tower than anything else.

The Chairman thanked the speakers at the close.

LEEDS ARCHITECTURAL SOCIETY.

MR. D. B. NIVEN, architect, London, delivered a lecture in the Law Institute, Leeds, before the members of the Leeds and Yorkshire Architectural Society, on "Como Cathedral; its Makers and its Influences." Mr. G. B. Bulmer, president of the Society, occupied the chair.

Mr. Niven, in the course of some preliminary observations, showed that Como Cathedral was commenced amid great difficulties, and he dwelt on the enthusiasm with which all classes of the people combined to raise the money necessary to carry out the work. The building, he said, was commenced by Lorenzo de Spazi in 1396. The first design was Gothic in character, and the west front, as well as the interior of the nave, still remained to show the intention of the original designers. Commenting on Bramante's connection with the work, he said that although this great architect had influenced the design of the whole building, he had only actually carried out a comparatively small portion of it. Bramante was entrusted with the work early in the period of the Renaissance, and prepared the design for the covering-in of the uncompleted portions of the Gothic church in the new manner; but so cleverly was this done that his work, although Classic in detail, was Gothic in character, the fusion of the styles in this building being most happy. The lecturer proceeded to show how Bramante's design was influenced, not only by the Gothic lines on which he had to work, but also by the fact that he had originally been trained as a painter. He had closely studied the Roman and other Classical remains, and this had given breadth and dignity to his work, and this Mr. Niven showed to have been the practice of many of the old masters, who not only studied the remains of antiquity for their detail, but compared one building with another in order to arrive at true ideas of proportion. Bramante had grasped these principles thoroughly, and much of his work was dependent on this early study. After Bramante, the work was continued by two gifted brothers, Tomasso and Jacopo Rodario, who continued it on the lines which Bramante had laid down, but with the freedom and originality in actual design characteristic of that period. In conclusion, Mr. Niven referred to the far-reaching effects of Como Cathedral, showing how it had influenced much of the Renaissance work in the North of Italy, and also how, in all probability, the delicate detail of the work of the French Renaissance could be traced to this source. In Spain, too, there were many indications still existing of designs based on the work of Como.

The British Archaeological Association will meet this year in Manchester.

Income Tax from 5s. to 20s. in the £.

SIR,—Most people will be surprised to hear that the income tax on one class of income generally amounts to the above figures, and often much above. The income I speak of is the tax on landlord's income, when derived from houses let on three years, yearly, or shorter tenancies, and if the property be subject to a mortgage and ground-rent it will be found to amount to the above amount in the £. I will give the case of a house let at £50 per annum, on which the owner has a mortgage of £500, subject to a ground-rent of £8 per annum, quite the usual suburban house.

A tax of 7d. in the £ is paid on the £50, which amounts to	£1 9 2
And of this he receives from his mortgagees as his income tax on the interest £25	£0 14 7
From the ground landlord on £8	0 4 8
	0 19 3
Leaving	£0 9 11

that being the amount of 7d. in the £, the leaseholder has to pay on his income, supposed to be £17 per annum.

I must now estimate the amounts he has to pay out of his gross profit. In the first place the house must be let, and my experience is that a change takes place every five years.

The agent's fee for letting the house would be 50s. This distributed over five years would be per annum	£0 10 0
Outside painting (every three years £5) per annum	1 13 4
The roofs and drains would average per annum	1 0 0
Fire insurance per annum	0 7 6
Decorations (every six years £30—often after three years) per annum	5 0 0
A fund must be arranged in some way for depreciation of lease by efflux of time (say 10s. per £100 per annum), and taking the cost of the house at the amount of the mortgage £500	2 10 0
Empties and cost of collecting, at least, per annum	4 0 0
	£15 0 10

Thus,

One year's rental	£50 0 0
Interest on £500	£25 0 0
Ground rent	8 0 0
Expenses as above	15 0 10
	48 0 10

Leaves an actual profit of £1 19 2

On which an income-tax of 9s. 11d. is paid, or at the rate of 5s. in the £.

Or, if the house be let at £45 per annum, which is not unusual, there is a loss of about £2 17s. 11d. per annum to the unfortunate leaseholder, and yet he has to pay an income tax of 7s.

Now, supposing the above house held by an owner having no mortgage on it, in that case the income tax would be 9½d. in the £, and if held by the freeholder without mortgage, 8½d. in the £. This alone will show the unfairness of the tax as now levied. It is the one business where the tax is levied upon the gross income, no allowance being made for losses or working expenses. These are not fancy cases. The houses can be shown and the income and outgoings proved. There would be no trouble to find thousands of similar houses within five miles of Charing Cross, where the leaseholder is paying income tax of over 20s. in the £ after the fair deductions, as allowed in other businesses, are taken off the gross income.

There can be no question about the tax being unjust, and the least that can be done to relieve the owners of this class of property is that the tax be collected on the rateable value, or five-sixths of the rent paid to the landlord. It works out quite differently with high-class property let on lease, therefore making it more unfair, as the landlord only allows the income tax to be deducted on the amount received. Where the tenant takes on a repairing lease there is scarcely any loss of rent, as the changes are much less frequent, no repairs, no insurance; in fact, the landlord has only to provide a sinking fund to recoup the money that the house cost him, which, of course, must come out of the rent received, as the whole property goes to the freeholder at the end of the lease.

Trusting you will give the above your consideration and do what you can to remedy this glaring injustice,—I remain, Sir, yours truly,

E. ESTCOURT,

8 Canfield Gardens, Hampstead.

GENERAL.

The Annual Exhibition of pictures at the Manchester Academy of Fine Arts was opened on Wednesday, the 21st inst.

The Sixty-eighth Exhibition of the Royal Scottish Academy was opened on Saturday last.

The Spring Exhibition was opened on Monday in the Leeds City Art Gallery. The collection is hardly representative, owing to the increasing difficulties of getting Royal Academicians to lend their works for exhibition in the provinces.

At the Meeting of the Dublin Arts Club on Thursday (yesterday), Mr. W. Booth Pearsall read a short paper on "John Constable, R.A.," which was illustrated with sketches, studies and lantern illustrations.

Mr. L. F. Day delivered a lecture on "Ornamental Offshoots of the Italian Renaissance" in the Art Museum, Nottingham, on Friday last.

The Council of the Sanitary Institute have accepted an invitation received from the Lord Mayor and citizens of Liverpool, to hold their next congress and exhibition in that city in the autumn of this year.

The City Commission of Sewers have decided to authorise the sanitary committee to conclude arrangements with the almoners of Christ's Hospital for the carrying out of a modified scheme of sanitary reform at the school. The almoners will at once ask the consent of the Charity Commissioners to the outlay, and if this is obtained the work will be proceeded with as speedily as possible, and a large number of the boys will return to the school as soon as the scheme has been carried into execution.

The Duc d'Aumale has commissioned MM. Merson and Penne to paint a series of decorative panels for the Pavillon de Blois, Chantilly. The subjects will be hunting scenes of the Condés, from the sixteenth to the nineteenth century.

M. Raoul Verlet has been selected as sculptor of the statue of the late Guy Maupassant, which is to be erected in Paris.

The Committee formed to erect a memorial to the late Dean of Lincoln have decided that the memorial shall take the form of a recumbent statue, to be placed in Lincoln Cathedral, and a window placed in Wantage Church, Berks, where the deceased was formerly vicar.

Mr. G. E. Thompson delivered a lecture at the Walker Art Gallery, Liverpool, entitled "Around the Roman Campagna," illustrated by 120 lantern slides of classical scenes among the hills round Rome—Monte Soracte, rising amid the flat Campagna, and scenes as far south as Naples; the gardens and palaces of Frascati, the lakes of Albano and Nemi, and the Tivoli waterfalls.

The Annual Dinner of the Society of Architects will take place on Tuesday, the 27th inst., and among the guests who will be present may be mentioned Sir James D. Linton, president of the Royal Institute of Painters in Water-Colours; Mr. Wyke Bayliss, F.S.A., Dr. Rentoul, M.P., Mr. W. R. Bousfield, Q.C., M.P., Mr. Atherley-Jones, M.P., Mr. G. Gandy, Q.C., Sir Henry Mance, Dr. Longstaff, chairman of the London County Council's Streets and Buildings Bill Committee; the Rev. Canon G. F. Browne and the Master of the Tylers' and Bricklayers' Company.

Mrs. P. E. Newman will read a paper on "Goldsmiths' Work, Past and Present," before the applied art section of the Society of Arts on Tuesday next.

The London School Board intend to appoint twelve additional woodwork instructors.

A Society of Illustrators is about to be formed and all persons engaged in any branch of the fine and applied arts are eligible for membership. The subscription is half a guinea.

The Manchester Academy of Fine Arts have just held the thirty-fourth annual meeting, Mr. H. Clarence Whaite, president, in the chair. The following were elected officers:—President, H. Clarence Whaite, P.R.C.A.; vice-president, Reginald Barber; members' auditor, William Robinson; hon. treasurer, William Artingstall; hon. secretary, Elias Bancroft; literary secretary, W. Herbert Johnston; hon. auditor, T. Walton Gillibrand; council, John Houghton Hague, Henry Measham, John Cassidy, Miss S. Isabel Dacre and Miss Florence Monkhouse.

Professor H. G. Seeley, F.R.S., has commenced a course of lectures on "The Shaping of the Earth," at Wortley Hall, Seven Sisters Road, N. (adjoining Finsbury Park Station), on Thursday evenings at eight o'clock, as the winter course of the London Geological Field Class.

Papers on "The Liverpool Overhead Railway" and "The Electrical Equipment of the Liverpool Overhead Railway" will be read at the meeting of the Institution of Civil Engineers on Tuesday next.

A Faculty has been issued for the restoration of Lisworney Church, plans for which have been prepared by Messrs. Bruton & Williams, Architects.

The Architect.

THE WEEK.

As England is held responsible for whatever occurs in Egypt, care must be taken to avoid participation in any act, such as the destruction of the temples at Philæ, which is likely to discredit this country for ever. The projected treatment of the buildings on the little island is tantamount to the making away with documents which confer rights. Without the buildings and other ancient structures the place of Egypt in the history of civilisation and of art would be questionable: they form the best title to the esteem of the world. Now the proposed vandalism will destroy for ever one of the best foundations for that claim. There are, it is true, remains which are on a more colossal scale, but at Philæ we find that Egyptian severity was softened, and the massiveness of the columns and other parts of the temples acquired a sort of picturesqueness. The admirers of the buildings are as well aware as the advocates of destruction that the work is far less ancient than what is to be seen elsewhere, but they may be excused if for once they prefer beauty to age. At Philæ the visitor is not so much overpowered by grandeur as charmed by a treatment that seems to be in keeping with the place, and on that account the eagerness to insure the safety of the buildings should be excused even by hydraulic engineers. English engineers have displayed so much ability in overcoming difficulties, we cannot believe that the proposed reservoir is not to be attained without the loss of a treasure which is sure to be more appreciated in proportion as the world grows older.

ONE of the excuses offered for setting up colossal announcements in picturesque parts of the country is, that owing to agricultural depression the farmers are compelled to utilise their fields in any way that will bring in money. A correspondent of *A Beautiful World*, the journal of the society for checking the abuses of public advertising, has been investigating the subject, and discovers that the usual price paid for allowing one of those obnoxious boards to be erected is 10s. In cases where there is a chance of doing particularly widespread mischief, 5s. has been given, but apparently it must be necessary to degrade an exceptionally beautiful landscape for that sum. The rural mind, unfortunately, is disposed to take a sordid view of nature, but we expected that more shrewdness would be shown in dealing with the quack medicine factories. Rents must be low when advertising stations in the best positions can be obtained by a single payment of 10s.

THE offer of 38,000*l.* by Mr. YATES THOMPSON towards the erection of the mortuary chapel at Westminster, which Mr. PEARSON has designed, if not altogether wise, is most liberal. The First Commissioner of Works has displayed prudence in his hesitation about accepting the gift. People may say that if Westminster has not sufficient space to entomb the multitude of great men produced every year in England, all that has to be done is to construct additional buildings. The Abbey is now no more than a place of exhibition which figures on the lists of the shows of London, and the more tombs and ceremonies there are to be seen the more gratification will be derived by sightseers. Men and women who are in want of entertainment have reason to be grateful to any one who will enlarge the spectacle. For the sake of its history the old building has, however, some claims on Englishmen, which should be compared with those of the tourists'. Is it possible to erect additions without some sacrifice of the architectural interest of the Abbey? One class of people we know will assert that Gothic, and especially English Gothic, is so elastic, one of the buildings can be increased or diminished or modernised without the least loss of character. That theory, fortunately, does not gain general acceptance, and although Mr. SHAW-LEFEVRE is not indisposed to have his name associated with novel works, and above all with a Campo Santo, we may assume that he will not

willingly approve of any work which will make the Abbey less characteristic. It would be more judicious to spare the building, and impose a sacrifice on the celebrities. Numerous tombs and memorials are to be seen which cannot preserve the subjects from oblivion. Why not clear them away, and if they must be preserved, set them up in a receptacle beyond the metropolitan boundaries? The removal of marble work which is as useless for the dead as for the living would afford sufficient space for new monuments. The morbid ambition to have plebeian dust mingled with the dust of kings might be satisfied by insisting on the cremation of all those who are deemed worthy of such a resting-place. If, however, new buildings are to be erected to give opportunities to display the resources of the funeral undertakers, would it not be more fitting if the nation supplied the funds? To have to wait for a grave until it is provided at the expense of a stranger is hardly an incentive to noble deeds.

A MEETING of the Institute of Architects was held on Monday evening, when Professor T. ROGER SMITH read a paper written by himself, and three others by Professors J. A. FLEMING, G. CAREY FOSTER and T. HUDSON BEARE (the two latter gentlemen being present) on "The New Engineering and Physical Laboratories at University College." A vote of thanks was duly proposed by Mr. GORDON SMITH and seconded by Professor KERR, the discussion being continued by Professor UNWIN, Messrs. H. H. STATHAM, ELSEY SMITH, WILLIAM WOODWARD, FOSTER HAYWOOD, and Professors CAPPER, CAREY FOSTER and HUDSON BEARE. Since University College was designed by WILKINS, the dome and portico of which are familiar objects to Londoners, the buildings have from time to time been extended by the addition of a south wing designed by Mr. T. HAYTER LEWIS, and later by a north wing carried out from the designs of Messrs. PERRY & REED. The last addition will practically complete the quadrangle, and it is in these new buildings that the laboratories are situated. The papers dealt with the arrangements and plans of the new buildings, modes of construction and materials. The laboratories, with their interior fittings, were described, as also the electric engineering department and interior fittings, and electric plant in the engineering laboratory, the equipment of the mechanical engineering laboratory and workshops, and other details regarding the testing of the materials used in the buildings. Among the official business transacted was the appointment of Mr. W. MARKS as auditor in the place of Mr. MIDDLETON, who had resigned.

THE annual dinner of the Society of Architects took place on Tuesday, and was very successful. Mr. GEORGE HIGHTON presided. The Rev. Canon BROWNE, in responding for the clergy, mentioned that the Dean and Chapter of St. Paul's Cathedral had been occupied with the decoration of the interior of the building, and he was told by a gentleman who had studied the subject that there was not in Europe any mosaic, ancient or modern, which would compare in splendour with that shortly to be seen in the dome. Mr. ATHERLEY JONES, M.P., described the Bill for the registration of architects as destined, when it became law, to contribute to the general welfare of the community. He was not hopeful as to the passing of the measure during the coming session, but he hoped that members of Parliament would do their utmost to secure for the Bill a good place, because it was an undoubted fact that the Bill met with the general approbation of members of Parliament. Mr. WYKE BAYLISS, in proposing success to the Society, said the true architect was a first-rate artist and a first-rate engineer rolled into one. The architect was a magician, who used only a foot-rule, but with it what magic was wrought. Architects were the representatives of the noblest, greatest and divinest of the arts. The President, in responding, said that in 1885 the members numbered 259; last session they had increased to 477. But they must not be content to remain at that number. He recommended a better attendance at the meetings when papers were read and discussed.

COLOURED SCULPTURE.

IN a great many shop windows in London and provincial towns the display of coloured figures has become remarkable. They are mainly produced in Austrian potteries. As examples of modelling they are not without cleverness, although the subjects are rarely of much importance. Moors and negroes abound, and it is possible to obtain figures of as large a party of sooty minstrels as can be seen any day in August at Margate. There are swinging monkeys which can be suspended from ceilings. Figures of Italian shepherd boys are also prepared in such a way that they can be seated on cabinets and pieces of furniture, where they will appear to be piping and confer an air of pastoral *naïveté* on a drawing-room. Apparently this polychrome sculpture has beaten Parian statuettes out of the market. It gratifies the weakness for strong colours which was possessed by men from the least civilised ages, and it is inspired by the craving after naturalism which is a product of the most scientific of all ages. What is the use of a white material when people desire to recall the striped pantaloons of nigger minstrels, the multicoloured rags of Italian peasants, or the fashionable absurdities which belonged to the Incroyables? Sir ISAAC NEWTON, as became a lover of truth, could not understand how anybody was able to find stone dolls interesting. If the obnoxious statuary had been covered with a few layers of bright paint he would have enjoyed it. A coloured apple enabled him to reveal something about gravitation; if Austrian pottery was to be seen in his friends' houses, who could count the number of truths with which he would have enriched science?

That there is a demand for coloured sculpture is, if possible, more clearly shown by every modern exhibition in Paris. The rival societies that have encamped themselves on the Champs Elysées and the Champ de Mars, as well as the supernumeraries who have to contend apart, have of late permitted industrial artists to take a share in the exhibitions. As a rule, the new recruits are no more than producers of coloured figures. Work of the kind is non-academic, but it is useful in pleasing the visitors. A man may be a Dutchman or a German, says JEAN PAUL, but every woman is born a Parisian, and since the Parisian dames are at present bewitched by the statuettes which are chryselephantine (and it may be more dainty than was the Olympian ZEUS), need we wonder if all over the world figures more or less glaring are to be bought by all who are eager to resemble those fair aestheticians? The painters who so readily transform themselves into sculptors cannot be expected to be satisfied with a monochrome material, especially when they observe the success of the industrial artists. M. GÉRÔME, in his *Bellona*, exemplified the true character of the sculpture which painters, and especially those who are possessed of courage, are ambitious to produce. The world is glad to see, if not to purchase, a work of that class, for it wants to have as little monotony as it can, and it craves for a variety of colour not only in buildings, sculpture and painting, but in the roughest sketches of the daily illustrated papers.

It will be difficult to convince the world that in sculpture at least colour is not allowable. The representatives of all nations who saw GIBSON'S *Venus* in Hyde Park were supposed to have condemned the tinting of marble, and the Welsh sculptor felt that the universal verdict was not in his favour. Many things which were intolerable in 1851 are, however, now appreciated, and if the *Venus* were to appear in the contemplated international exhibition, there would probably be a reversal of judgment. The fact is, people have become so accustomed to the amendment and repeal of legislative edicts they are tolerant about deviations from established principles in aesthetics, for they are unable to believe that the laws of taste can be more unalterable than those which have regulated the conduct of good citizens for centuries.

It so happens that sculpture presents one of those cases which offer contentious principles for all who are of a militant disposition. The history of the art is as uncertain as the theory. Everybody, for instance, will admit that the majority of Greek works which have come down to us are of marble that is nearly white. The advocates of polychromy, however, maintain that in many cases there were

remains of colour on the figures when they were found, which were removed in order to comply with the prepossession of connoisseurs in favour of unstained marble. In the early part of the century QUATREMÈRE DE QUINCY declared that he could still discern traces of red on the fleshy parts of Greek statues in Versailles and the Louvre, but the colour was daily becoming fainter. The recent revelations about the manipulation of the Cyprus figures, which are now in New York, are evidence of the bold but irreverential processes for adapting antiques to modern desires which still prevail among discoverers and experts. The conservators of the Louvre did not hesitate about cutting off the pedestal of the *Venus of Melos*, because on it was engraved the sculptor's name, and they wished to make their countrymen happy and the rest of Europe envious by presenting it as a work of PRAXITELES. In consequence we can no longer be certain whether the figure was originally perpendicular or at what angle it was inclined. The left arm and hand were also removed out of regard for symmetry. The head of the *Laocoon* has been interpreted by LESSING as a creation of inspired compassion that could unite pain with beauty. Tear open the mouth, says the critic, and the face becomes unsightly and abominable, forcing us to turn away our faces from it. There seems to be reason to suppose that the sublime head was created for the group after it was found, and the original head, which was afterwards exhumed, suggested that the priest of APOLLO was indifferent to theory, and instead of decorous sighing howled aloud. Compared with those instances of adaptation, the removal of patches of old stains would be a slight misdemeanour. It would therefore be unsafe to allege, from the present appearance of the sculpture, that polychromy was an unknown process among the Greeks.

The historical evidence is no less dubious. A straightforward account of the colouring of sculpture has not survived. The rare allusions to the practice are more or less indefinite, or are supposed to refer to exceptional works. PAUSANIAS, who was the forerunner of the MURRAYS, BURCKHARDTS and BAEDEKERS of the nineteenth century, is silent on the subject. Yet it might be supposed that if colouring were a general practice, some at least of the figures that were so treated would be worth a remark. There is an often quoted passage from PLATO'S "Republic," in which SOCRATES is made to say, "Just as if some one who should find us repainting statues should censure us because we did not put the most beautiful colours upon the most beautiful parts of the figure; for the eyes, which are the most beautiful, should be coloured not with purple but with black." Some scholars have assumed that the words relate to pictures. That may arise from prejudice. WINCKELMANN admits that PLATO was thinking of sculpture. The passage evidently relates to partial painting, and beneath a Greek sky there may have been an advantage in emphasising eyes which under most circumstances would be almost expressionless, or it may be too staring in effect. Taken literally, the passage does not affirm or deny anything about the painting of the whole figure. There is also the old story preserved by PLINY, who relates how PRAXITELES, when asked which of his works he most admired, answered, "Those which NICIAS has had under his hands." It is concluded by the upholders of polychromy that PRAXITELES' works were operated on by painters, and he preferred those which were coloured by NICIAS. The interpretation offered by WINCKELMANN is that NICIAS went over the clay models and imparted to them a little of that flexibility of contour which is seen in pictures. In support of the theory it can be said that some of the works ascribed to PRAXITELES are not marked by severity; they have a softness and grace that are more characteristic of a later period. On the other hand, Q. DE QUINCY supposes that PLINY spoke about encaustic painting which was applied generally, and that view is usually accepted of late years. It becomes the strongest evidence that can be furnished by the researches of scholars in support of polychromy.

Where there is so much difference, the safest conclusion to draw is that the Greeks did not restrict themselves to one mode of finishing their sculpture. From a remote time they were familiar with figures that were covered with vermilion, and which were accepted as not unsuitable representations of supernatural beings. In that way the staining or painting

of a figure with a sort of flesh-colour would not appear to them as unwarranted. Besides, we must remember that real robes, armour and jewellery were sometimes placed around statues. As the contrast between the white marble and the additions would be too marked and harsh to please the fastidious Greeks, colour was likely to be used to bring all parts into unity.

The arguments of those who maintain that every statue was coloured can be met by the existence of numerous examples of sculpture in which effect was gained by an accentuation of the rigidity of the marble. There are, for example, details in the *Apollo Belvedere* which have compelled sculptors to believe that it was copied from a work in bronze. The head of one of the horses from the pediment of the Parthenon, which has been described as a petrification of the creature formed by the hand of the god, is an example of the way in which the limitation offered by material is turned to account. The hardness and decision of the bony forms, as distinguished from the elasticity of the tendon and the softness of flesh of the horses in the Panathenaic procession, which amazed FLAXMAN, also exemplify treatment which would not be enhanced by any colour. The lithe figures of several of the athletes in the museums of Europe seem also adapted for being rendered in marble alone. On the contrary, with many of the figures of goddesses the application of colour need not be a wasteful excess of labour. The figurines discovered at Tanagra and elsewhere would not gain in effect if the colouring were removed, and if the Greeks succeeded with things on a miniature scale, we may be satisfied that they would not offend against the proprieties when dealing with works which were to sustain the criticism of the citizens.

There is hardly a theory concerning works of art which is not established on an unstable foundation. It is, therefore, absurd to dogmatise about colour being indispensable or unnecessary. The Germans, who have given more time than their neighbours to speculations on the subject of colour, are undecided, but probably there is a majority in favour of tinted figures. That polychromy has gained a footing is a sort of victory for it. Four centuries ago, or longer, Mediæval practice was ignored, and since that time Europe has been more loyal to the principle of keeping colour apart from sculpture than to most others. It is astonishing how much has been evolved in favour of whiteness, for bronze is accepted as no more than a substitute for marble, which can have few independent qualities. According to FLAXMAN, "the very reasons which prove that colours in sculpture may have the effect of supernatural vision, fits, or death, prove at the same time that such practice is utterly improper for a general representation of the human figure; because as the tints of carnation in nature are consequences of circulation, wherever the colour of flesh is seen without motion it resembles only death or suspension of the vital powers." Yet in the next paragraph of his lecture FLAXMAN admits the power of colour, when he tells us that the motive of the Greeks in applying it to their sculpture "was the desire of rendering these stupendous forms living and intelligent to the astonished gaze of the votary, and to confound the sceptical by a flash of conviction that something of divinity resided in the statues themselves." His words alone are enough to suggest how difficult it is for an artist who is not swayed by prejudice or convention to come to a conclusion on the subject. The arguments for and against the application of colour seem to have equal weight. FALCONET, the French sculptor, who was academical in his aspirations, would not attempt any combination of coloured materials in his own works, nor would he apply colour to marble. But he could not deny that very able men among his contemporaries differed from him. There is no doubt, he said, that materials of divers colours, if employed with intelligence, can be made to produce picturesque effects. The kind of intelligence which FALCONET assumed is rare among artists, for the failures in coloured sculpture are not as numerous as the successes. The best modern efforts are on a miniature scale, and are more allied to the chryselephantine works of the ancients than to those which were formed with white marble heads and extremities, while black was used for the draperies. Whether experiments on a more imposing scale would be as successful remains to be seen. But it may be assumed that people who can

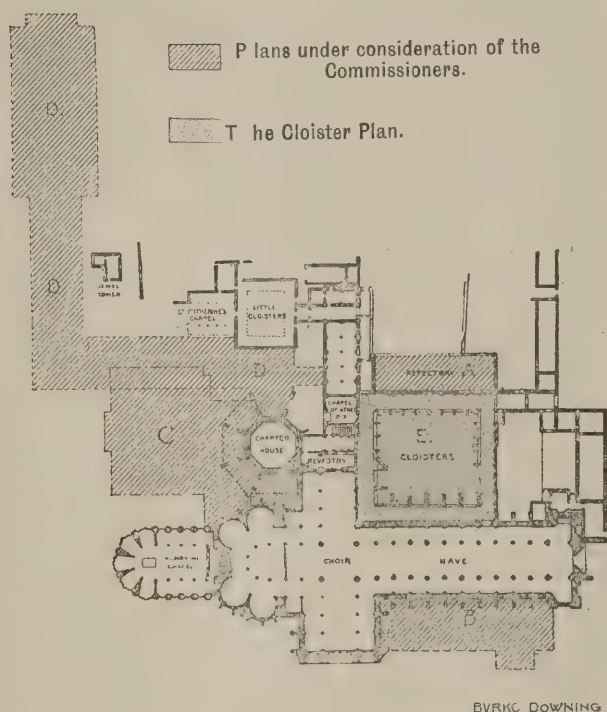

admire the crude colours of the Austrian potters are never likely to appreciate the delicate colouring which would be necessary if sculpture is to remain as one of the fine arts.

THE PROPOSED ADDITION TO WESTMINSTER ABBEY.

By H. P. BURKE-DOWNING.

HAD the question of cost been the only one in the way, it is probable that Mr. YATES THOMPSON's generous offer, which has now been made public, might have removed the grand obstacle to a final settlement of this matter. But this is not the case. The equally important question of where the new building (if new building there must be) is to be situated has yet to be decided.

Many schemes were considered by the Royal Commission before they issued their final report in 1891, and although they rejected all but two, they were evenly divided as to which of the two should be recommended. One of these two schemes proposed the erection of a monumental chapel on a portion of the area now occupied by certain houses in Old Palace Yard, to be connected with the Abbey

- A—Mr. Pearson's Chapel on the Refectory Site.
- B—Mr. Pearson's Chapel on the North of the Nave.
- C—Position suggested by Mr. Somers Clarke and Mr. Pearson. Outline of Mr. Clarke's Plan.
- D—Mr. Seddon's Monumental Cloisters and Chapel.
- E—The Cloisters and Cloister Garth.

at Poets' Corner. The other plan contemplated the erection of a monumental chapel on a vacant piece of ground, the site of the old refectory, lying parallel to the nave of the Abbey and adjoining the south wall of the great cloister. In one thing the Commission was unanimous, and it is good to see from Mr. SHAW-LEFEVRE's letter that the Government propose to lay a scheme before Parliament shortly for carrying out its recommendations on this point, viz. the clearing away the houses in Old Palace Yard that are a standing source of danger to the Abbey by their liability to fire.

Mr. THOMPSON's offer appears to be confined to one (viz. Mr. PEARSON's) of several methods which were laid before the Commission of carrying out the first alternative suggestion, and consequently it is not likely that it will help us much further towards an immediate solution of the difficulties with which the matter is surrounded, for until something is done to determine between the alternative recommendations of the Royal Commission, the state of things is pretty much of a deadlock.

To be decided the question must be reopened, and on any reopening might not some of the rejected schemes again claim attention? One of the principal qualifications which all were agreed the place for future memorials must possess, if it could not be found actually within the Abbey buildings, was an intimate union or connection with the Abbey. This is only reasonable, and if, indeed, it is not conceded, there seems no peculiar reason why we should confine ourselves to a site for the new monumental chapel in the immediate neighbourhood of the Abbey at all. As to how far each competing scheme satisfies this particular condition opinions will certainly differ, but it may very reasonably be urged that the scheme for a chapel on the site of the old refectory better satisfies this condition than the other scheme recommended by the Commission, and to which Mr. THOMPSON'S offer is confined. The refectory site would be the closer of the two, approached more directly and by a path which already shares the sentiments with which the Abbey itself is regarded. The new north aisle, which was one of the rejected schemes, would stand in an even more intimate connection, but to this there would be grave objections on the ground of serious interference with the ancient fabric.

But why not come still closer and avoid all the difficulty that we should certainly feel in regarding a "new memorial chapel" as one with the ancient Abbey? One of the suggestions before the Commission for supplying the much wanted space was to utilise for the purpose the ancient cloisters. Strictly speaking, these may not be "within the Abbey" (though the east walk of the great cloisters is structurally under the Abbey roof, occupying, in fact, the place of the western aisle of the south transept), but who is conscious of any distinction in his feelings with regard to the cloisters and to the Abbey itself? This scheme for utilising the cloisters for memorials—and here it may be remarked that the present difficulty is rather to find memorial space than burying space, which is probably ample for some 100 years to come, as appeared from the Dean's evidence—was rejected by the Commission on the ground that they are used as approaches to Westminster School, the chapter-house, the Abbey and its surrounding residences; but surely, were they to be adapted for the purpose of memorials, their use for convenience of approach might easily be restricted without very seriously incommoding any one; and then the other ground on which they were deemed unsuitable by the Commissioners, viz. their want of available width for memorial purposes, would lose considerable force. Whether employed in restoring and glazing the cloisters, in order to adapt them for the reception of the memorials of England's worthies in continuation of the long roll preserved within the Abbey walls, or merely in restoring without any intention of making use of them for any but their present purposes, a considerable sum of money might well be laid out, and the more that is done to brighten and restore to its former beauty and dignity this most ancient and—from its familiar connection with the daily life of the Abbey community—most interesting part of the Abbey, the more probably would its suitability for the purpose now before us be made to appear.

One great advantage which the utilisation of the cloisters would have is that the chapter-house might then, and would then, be really opened up (by the removal of the Old Palace Yard houses). This is an advantage recognised by all, and equally claimed for nearly every scheme put forward for a building on the south-east side of the chapter-house; but surely it is idle to talk of opening up the chapter-house if the view is immediately to be closed out again, as by all these schemes it unavoidably would be—at any rate in a very great measure.

In his scheme for dealing with this site Mr. PEARSON takes the greatest pains to leave open as much as possible of the chapter-house; but even by that, as may be seen from the elevation and perspective view in outline which accompanies the plan laid by Mr. PEARSON before the Commission, the whole of the lower part of the building beneath the windows would be enclosed. This being so, though we might feel sure that Mr. PEARSON'S new building would be in every way worthy of its surroundings, it would exclude us from a full view of the chapter-house from its ground-line, by which means it is clear that that element of the beauty of the building which consists in the perfection of its proportions as a whole would be lost to us.

THE MONUMENTS OF ANCIENT EGYPT.

A MEETING of the Society for the Preservation of the Monuments of Ancient Egypt was held on Friday last in the rooms of the Society of Antiquaries. The main object of the meeting was to protest against the scheme for forming a lake or reservoir at Philæ, which would render necessary either the submersion or the removal of the group of ancient buildings at that spot. The Earl of Wharcliffe having resigned the office of president, the Earl of Carlisle was elected as his successor and General Donnelly was elected vice-president.

The report, which was printed in *The Architect* last week, having been adopted, Mr. E. J. Poynter, R.A., the secretary, read the following letter which had been received from the Foreign Office:—

Foreign Office: February 14.

Sir,—I am directed by the Earl of Rosebery to acknowledge the receipt of your letter of the 5th inst., requesting information regarding the commission to be appointed in Egypt to consider the question of the storage of the Nile water, and expressing the fear of the Society for the Preservation of Ancient Monuments in Egypt lest the Egyptian Government should be advised to adopt a scheme which will involve the submersion of the temples of Philæ. I am to inform you that no decision has yet been arrived at, but that a special technical commission, composed of an English, a French and an Italian engineer, will be appointed by the Egyptian Government in the course of this month to consider the various projects which have been submitted for storing the surplus waters of the Nile. I am to enclose for communication to the Society an extract from a despatch on the subject which was addressed in December last by the Egyptian Foreign Minister to the foreign representatives in Cairo.—I am, sir, your most obedient, humble servant,

T. H. SANDERSON.

E. J. Poynter, Esq, R.A.

The Secretary also read a letter from Sir Frederick Leighton protesting against the vandalism of the scheme, and his hearty sympathy with the endeavours of the Society. The following resolution of the executive committee passed at a meeting on February 22, 1894, was put to the meeting:—

"That the Society for the Preservation of the Monuments of Ancient Egypt have heard with dismay that the project of making a dam above Assouan to form a reservoir of the Nile water, which will entail the submersion of the island and temples of Philæ during many months in every year, is about to be considered as one of the schemes which may be recommended for adoption by the technical commission recently appointed in Cairo to consider the question. The destruction of this group of buildings, unique for its beauty and of the highest historical interest, is an event which would be viewed as a disaster by the whole civilised world; and the proposed taking down and reconstruction of the temples on another island will in no way meet the objections to the scheme. The Society therefore begs to submit to the Secretary of State for Foreign Affairs that immediate steps should be taken to press for the withdrawal of the project from the consideration of the technical commission, and thus prevent this country from being in any way responsible for what would certainly be considered an act of vandalism."

A like resolution had on the same day been passed by the Society of Antiquaries. An extract was also read from Mr. Willcocks's report on "Perennial Irrigation and Flood Protection for Egypt," containing a note by Mr. W. E. Garstin, Under-Secretary for Public Works.

The President said that if the scheme were absolutely necessary for the good of the people of Egypt no considerations of sentiment should be allowed to stand in its way. But it would be impossible to preserve the character of the remains if they were removed, as much depended on the site. It would not be parallel with the case of the Elgin Marbles or the obelisks referred to. It would be more like an attempt to remove the Parthenon.

Sir Colin Scott-Moncrieff felt it his duty to speak on behalf of his successor, Mr. Garstin. The extract from his report was reasonable from beginning to end. Mr. Garstin's duty as an engineer was to find out the best plan for a reservoir in the interests of irrigation. He was not an antiquary or an Egyptologist, and admitted that the destruction of the temples would be an act of vandalism. But Mr. Garstin left the antiquarian question to M. de Morgan. Mr. Garstin was a man of eminent good sense, and the technical questions were left to a commission of engineers. There were not so many places for reservoirs as people thought. The matter would receive full justice and M. de Morgan would take care of the interests committed to him.

The President disclaimed any intention of criticising Mr. Garstin.

Colonel Plunkett, R.E., said that inaccurate reference was often made to the temple of Philæ. There were, in fact, not one temple, but a group of buildings some 400 yards long by 200 wide. Some of these were far older than what was called

"Pharaoh's Bed." He hoped the Egyptian sub-inspectors would do their duty. His experience was that native officials sometimes did damage to the remains of which they had charge.

It was announced that the cost of removing the temples would be about 200,000*l*.

THE LEIGHTON LIBRARY, DUNBLANE.

IT is recorded that Archbishop Leighton, who, according to Burnet, was "possessed with the highest and noblest sense of divine things," and who was "the freest from superstition, of censuring others or of imposing his own methods on them possible," left his library to Dunblane, where he once officiated as bishop. His successor, who had charge of the legacy, "supposed a room might be built out of some of the stones of the ruinous walls that are without the church, or of the bishop's ruined house, and desired that the room might be built of convenient largeness and good light, and handsomely furnished with presses and shelves and some desks for reading, and chaires or stools at them to sitt on."

The house was duly built, and seems to have cost 16*l*. 2*s*. 6*d*. sterling, and 200*l*. was assigned "to be stock for a sallery to a keeper." "Mr. Johne Liteljohn, student of divinity, the sone of a deceast minister within the diocess," was appointed first librarian. The building is a plain structure, consisting of a single room, built on arches, near the newly-restored cathedral. The inscription on a monumental stone let into the rough-cast wall has been defaced, but the mitre remains above and a skull beneath. This "alone of inhabited ecclesiastical edifices in Scotland," according to the late Dean Stanley ("Lectures on the History of the Church of Scotland," p. 113), "retains a mitre." Mounting some stone steps from outside, the visitor finds himself in a room about 35 feet long and 15 feet broad, with a modern whitewashed ceiling. Sixteen cases are ranged against the walls, with one long low case down the middle. They are constructed of old oak, pieced out with painted deal, and are in a very shaky condition. There are about a dozen good old oak chairs remaining in the room. On the walls are three engravings of the bishop, one marked "Ætat 40, 1654," and on the back "Jacobus Dixon dono dedit 26 Oct. 1779." One notes the large eyes, with their pensive look, the firm chin, the face clean shaven all but the upper lip, the mass of dark hair parted in the middle above the ample forehead. He is habited in gown and bands, like most divines of the period. An Indian ink enlargement of the engraving, now fallen to the floor, bears the inscription, "To the right honourable and reverend the trustees of the library of Dunblane, this drawing of Archbishop Leighton, its venerable founder, presented by John Robertson." There are also on the walls an engraving of Robert Drummond, Bishop of Sarum, afterwards Archbishop of York, 1761; a print of Dr. Finlayson, Professor of Logic in the University of Edinburgh, and a chart of British history.

The only librarian of any reputation seems to have been Mr. William Coldstream, who had a long spell of office in the last century. A tablet with an inscription in Latin to his memory has been placed in the cathedral. There is a desk in the library full of his papers. Among them the following letter:—"Dr.—If you have no appointment this night, I shall be glad to meet you and do what we designed last night. I debar Mercury and invite Bacchus for one hour.—I am, Dr. Sir, yr. most humble servt., Tho. Duthie. Dunblane, 12th Aprile, betwixt 5 and 6, —" (year obliterated).

There appear to have been originally between thirteen and fourteen hundred volumes, of which a considerable number have been lost. Many of these are enriched with marginal notes by Leighton's own hand.

ART OF GLASS-STAINING.

AT the meeting of the Philosophical Society of Glasgow in the Society's rooms, Bath Street, Professor Ferguson presiding, Mr. Stephen Adam read a paper on "The Art of Glass-Staining—Mediæval and Modern Methods." Within recent years, he remarked, such a marked advance had been made in and about Glasgow in the manufacture of the raw material, glass, as almost to revolutionise the character of the profession of glass-stainer, placing it, by the artistic excellence of materials at hand, on a wider and broader basis, and bringing it within reach of all who loved harmonious surroundings. There were possibilities in Glasgow never attempted yet. They had now at their disposal beautiful materials, richer in every way than the thin and textureless glass used even twelve years ago. The object of his paper was to show that to make more of any material such as glass, metal, marble or wood than what the pure material was capable of expressing in itself was to destroy the truth in it, and truth was the very germ and essence of art. Stained glasswork in the tenth century, he

stated, was produced by the monks, who used a hot iron for shaping out the glass, and used the hairs from the mane of an ass for tracing the details. Legitimate modern methods were pretty much the same. The materials now at hand rendered it possible for the present-day craftsman to produce glass equal in quality to that produced by the monks in the tenth century. He traced the history of the art to its decay in the seventeenth century, and to the introduction of German glass in the early part of the present century. The almost phenomenal progress of decorative art in Glasgow of late must satisfy the most fastidious in art matters that the craft in Glasgow possessed the ability and strength to do their own work. With the tuition the younger people were getting, the coming decade would surpass by leaps and bounds the wonderful advance of the past. Love of art was taking a firm hold, and nothing would more effectually sweeten the lives of hard-working men and women. He quite recognised the broad, cosmopolitan nature of art, and would not narrow it down to purely local circles and cliques, but at the same time encouragement must be given to art-workers and work in their midst. The Glasgow masses had to be educated up to appreciate, even to understand, say the new art galleries and all that doubtless would be beautiful and instructive in them, otherwise money and labour alike would be wasted. Let Glasgow flourish in art as in commerce, and flourish it would if the city magnates, the custodians of the city's honour in art, did their duty; flourish it would if the wealthy and influential among the citizens stopped running to London and continental cities for fabrics which, after all, they only brought back whence they had originally gone and at a doubled price. There were opportunities in the municipal buildings for intelligent decoration of its interior, and in which he hoped every city decorative product would play a part. Mere dazzle and attractiveness of marble slabs and glitter of gold leaf were not the highest form of decoration. Though it might appal and bewilder country cousins, it did not satisfy the intellectual man of art. There was nothing educative in mere dead material excepting for the geologist. Marble could be made to speak and tell wondrous stories; so could frescoes, painted decoration and stained-glass—stories informing those yet unborn of their city's history, the lives of its eminent men and women, and its industries, shipping and commerce.

Mr. John Mayer, the secretary, contributed a short supplementary paper on "The Manufacture of Cathedral, Muranese, Venetian and Rippled Plate-Glass in Glasgow."

ASYLUMS FOR THE INSANE.

THE first visit of the present session of the Edinburgh Architectural Association took place on Saturday afternoon to Craighouse Asylum. Dr. Clouston and Mr. Sydney Mitchell were the leaders of the party, the former dealing with the buildings in their medical aspect, the latter describing their main architectural features. Dr. Clouston explained that in old times the idea of an asylum for the insane was a prison. The whole notion was detention, and all architectural considerations were subservient to that of keeping in the patients safely. During the last fifty years, however, a great change had taken place in the ideas of asylum architecture. It had been altogether revolutionised. Medical experience had proved that a great number of the insane did not require these extreme restrictions; in fact, it was discovered that more than half the insane did not need them at all. It was also discovered that a man who was "off his head" was not necessarily altogether "off his head," and that if he were kindly and humanely treated, put into a room that was bright, pleasant and agreeable he was humanised, and the mental symptoms for which he was sent to the institution were enormously modified. It was found that a man's surroundings and conditions of life immensely influenced his state of mind. Therefore, the principle was got hold of to make the institution the right hand of the doctor, and that principle had been carried out. In order, however, to carry it out they had to keep in mind the enormous variety of the forms of mental disease. The common idea of insanity was that all insane folks were very much alike, but that was contrary to fact. Mental disease might exist in every possible form from the slightest departure from the normal condition to raving delirium. Medical study showed that it was better to have such a variety of architecture that almost each variety of mental disease should have something suitable to itself. The house required to be adapted to its inhabitants, and that principle had been carried out pretty well of late years. An asylum, therefore, should contain all the characteristics of an hospital in some of its parts, and of a home in others, and both aspects required to be mixed up together. They required further to make provision for the changes that a patient might pass through as his condition improved. It had an immensely healing influence to remove a patient from association with all that reminded him of the worst stage of his disease. In fact, all restrictions came to be abolished except those which were absolutely necessary. When the authorities of the Royal

Asylum came to consider what they ought to do in constructing their new buildings they found there was absolutely no standard they could adopt, for ideas were changing almost year by year. He had visited all the best institutions in Europe, Asia and America, and they had really devised in their own way the standard of what they were to do. They felt a sense of responsibility in regard to Edinburgh—a city of such magnificent architecture—and at the same time they were not going to allow their architect to sacrifice any of the medical considerations. They naturally wanted, for the sake of Edinburgh, for the sake of themselves, and above all for the sake of the insane, to make it the most efficient and the best institution, not in Edinburgh, not in England, but in the world. It was decided to provide for half the patients distinct houses like ordinary dwellings, and to have a large centre for administration, for amusement, for food, for physic, and this scheme had been carried into effect. The centre of the establishment was a great hall like the hall of an English Tudor mansion, where everybody met together, into which every part of the house opened. There were, he explained, different classes of wards, so that a patient progressing towards recovery might be removed from one to another, where he had not the associations of his delirium and the mental impression he got in the first. The kind of impression they wished to produce, he said, was one of cheerfulness, of fresh air, of bright colour and attractiveness. They wanted, indeed, to make the place so nice that every citizen of Edinburgh ought to think it a privilege to be there. Mr. Sydney Mitchell then conducted the party over the buildings and described them.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE fifth lecture of the session was delivered by Mr. George Walton, the subject being "Interior Decoration." By way of introduction the lecturer alluded to the different classes of decoration in use at present, which require, on the part of the decorator, considerable knowledge and experience to apply rightly in practice. The materials were described, with their capabilities for producing effective work. It was urged by the lecturer that simplicity and not elaboration should govern the work, and ornament, if used at all, should be used sparingly, and should be very fine and well adapted for its position. Pictures have their decorative value, and this has perhaps been overlooked by the artists of to-day, who, in the opinion of the lecturer, might act a little more in unison with the architect in creating work for permanent positions. In the decoration of an ordinary commonplace house the aim should be to get rid of the ugly portions, having them replaced by suitable decorations of an artistic value. The treatment of ceilings, walls and floors was dealt with at length by the lecturer, who described various methods of producing good results by the harmonious employment of the materials.

TESSERÆ.

Ancient Japanese Houses.

THE allusions to house structure in the *Kojiki*, though brief are suggestive, and carry us back without question to the condition of the Japanese house in the seventh and eighth centuries. Mr. Satow, in his translation of the Rituals, says that the period when this service was first instituted was certainly before the tenth century, and probably earlier. From these records he ascertains that the palace of the Japanese sovereign was a wooden hut, with its pillars planted in the ground, instead of being erected on broad flat stones, as in modern buildings. The whole framework, consisting of posts, beams, rafters, door-posts and window-frames, was tied together with cords made by twisting the long fibrous stems of climbing plants, such as *Pueraria thunbergiana* (*kuzu*) and *Wistaria sinensis* (*fuji*). The floor must have been low down, so that the occupants of the building, as they lay or squatted on their mats, were exposed to the stealthy attacks of venomous snakes, which were probably far more numerous in the earliest ages when the country was for the most part uncultivated than at the present day. There seems some reason to think that the *yuka*, here translated "floor," was originally nothing but a couch which ran around the sides of the hut, the rest of the space being simply a mud floor, and that the size of the couch was gradually increased until it occupied the whole interior. The rafters projected upward beyond the ridge-pole, crossing each other as is seen in the roofs of modern Shan-tau temples, whether their architecture be in conformity with early traditions (in which case all the rafters are so crossed) or modified in accordance with more advanced principles of construction, and the crossed rafters retained only as ornaments at the two ends of the ridge. The roof was thatched, and perhaps had a gable at each end, with a hole to allow the smoke of the wood fire to escape; so that it was possible for birds flying in and perching on the

beams overhead to defile the food or the fire with which it was cooked. From the *Kojiki* we learn that even in those early days the house was sufficiently differentiated to present forms referred to as temples or palaces, houses of the people, store-houses and rude huts. That the temples or palaces were more than rude huts is shown by references to the verandah, the great roof, stout pillars and high cross-beams. They were at least two storeys high, as we read of people gazing from an upper storey. The peasants were not allowed to build a house with a raised roof-frame—that is, a roof the upper portion or ridge of which was raised above the roof proper, and having a different structure. This indicates the existence at that time of different kinds of roofs or ridges. Fireplaces were in the middle of the floor, and the smoke outlet was in the gable end of the roof protected by a lattice, as seen in the Japanese country houses of to-day. The posts or pillars of the house were buried deep in the ground, and not as in the present house, resting on a stone foundation.

The Builder of the Alhambra.

On the walls of the Hall of the Two Sisters in the Alhambra, over the mosaic dado, are the following verses, forming a poem in honour of its builder, the Imán Ibn Nasr:—"I am the garden, and every morn do I appear decked out in beauty. Look attentively at my elegance, thou wilt reap the benefit of a commentary on decoration. For, by Allah! the elegant buildings by which I am surrounded certainly surpass all other buildings in the propitious omen attending their foundation. How many delightful prospects I enfold! How many objects, in the contemplation of which a highly-gifted mind finds the gratification of its utmost wishes! Here is the wonderful cupola, at sight of whose beautiful proportions all other cupolas vanish and disappear. To which the constellation of the Twins extends the hand of salutation, and to converse with which the full moon deserts her station in heaven. Nay, were they both to abide here in its two aisles, they would hasten to pay it such homage as would satisfy all the neighbours around. No wonder then if the stars grow pale in their high stations, and if a limit be put to the duration of their light. Here also is the portico unfolding every beauty. Indeed, had this palace no other ornament, it would surpass in splendour the high regions of the sky. For how many are the gorgeous robes in which thou, O Sultan, hast attired it, which surpass, in brilliancy of colour, the vaunted robes of Yemen! To look at them, one would imagine them to be so many planets revolving on the arches of this court as on their orbits, in order to throw in the shade even the first rays of morning. Here are columns ornamented with perfection, and the beauty of which has become proverbial; columns which, when struck by the rays of the rising sun, one might fancy, notwithstanding their colossal dimensions, to be so many blocks of pearl. Indeed, we never saw a palace more lofty than this in its exterior, or more brilliantly decorated in its interior; or having more extensive apartments—markets they are, where those provided with money are paid in beauty, and where the judge of elegance is perpetually sitting to pronounce sentence. Which, when the breath of the zephyr expires before the noon-tide rays, appear surrounded by a light which throws into shade all other light. Between me and victory the closest relationship exists; but the most striking resemblance between us two is the splendour we both bear."

Greco-Roman Wall-Paintings.

When the particular style of decoration which is familiar to us from the wall-paintings of Pompeii first came into vogue it is difficult to say. From the tomb of Volsci, in which the figures are arranged as in a bas-relief and form the chief feature of the decorative scheme to the Pompeian paintings—where they are quite subordinate to a more or less extravagant but always elegant architectural framework—there is a gap, which the discovery of the house in the gardens of the Farnesina, at Rome, supposed to be of the Republican period, does not entirely fill, for the system in this, though more sober and consistent and less fantastic, is already the same as at Pompeii. In this beautiful house and in the house of Livia, or Germanicus, as it is variously called, we have, with some exceptions, the finest specimens of antique decoration that exist. The former especially is evidently painted by the best artists of the time, and various painters have been employed on the figure-subjects in the panels. There are no paintings so good from Pompeii except from one house, and these remain only in small fragments arranged on a wall in one of the corridors of the Museo Borbonico, as nearly according to their original disposition as their imperfect state permitted. These fragments, however, display an art of design and a skill of execution which fully justifies the most extravagant estimate which is recorded of Greek artists. In certain qualities of execution they are unrivalled by the best work of any of the great schools of the sixteenth and seventeenth centuries. Freedom of hand and certainty of touch are the first requisites of decorative painting in no matter what style, but they are combined here with a rich

quality of impasto laid on with a full brush (but with supreme delicacy) in gradations which, though as clean as mosaic in the precision, are as full and round in modelling as though done by Velasquez; or a better comparison may be found, as we are treating of ornamental and foliated forms, in the fine but broadly-treated details of the wreaths of ivy and vine which adorn the figures in a Bacchanalian picture by Nicholas Poussin, exhibited a few years ago in one of the Royal Academy Winter exhibitions. The same, indeed, may be seen, though more obscured by time and varnish, in the two magnificent pictures of similar subjects by the same master in the National Gallery; they will at least convey an idea of the special quality of painting referred to. Imagine the whole decorations of a room carried out with the artistic perfection of these details, and with all the beauty of surface which the elaborately-prepared stucco grounds of the ancients provided for their artists, and one can realise a specimen of decorative art such as none but Greek artists have ever produced, and such as in our hurried world is not likely to be produced again.

Early English Gothic.

The general appearance of the Early Gothic styles, whether English, French or German—the glorious buildings of the thirteenth century—is truly magnificent, and this is generally known and acknowledged to be the finest period of the building art that the world has ever seen. The marvellous skill of the construction of the vaults, and the piers and buttresses to carry them, has long been admired as quite wonderful. A mere skeleton is built, and the wall between the buttresses may be as thin as possible, and even may be entirely of glass, as was discovered afterwards in the large windows of the Decorated and Perpendicular styles. Although there are local characteristics in each country and each district, the general style of the thirteenth century is the same all over the north and west of Europe. One place may be a generation in advance of another in the introduction of the new style, but it spread very rapidly in England and France; in Germany the fine Romanesque style of the Rhine churches lingered for half a century, but in general the progress was nearly simultaneous. That St. Hugh's choir at Lincoln is the earliest pure Gothic building in the world may be said to be now a matter of demonstration; the course of St. Hugh has been traced from his birth to his death, and all the buildings with which he was connected have been examined, and it is now clear that he was not an architect, and did not bring either architect or masons with him from Grenoble, which was, on the contrary, very much behind England at that period. The name of the architect is French, but his family came over to England with William the Conqueror, and settled in Lincolnshire, where it is still one of the county families, and there is little doubt that Geoffrey de Noyers (now called Dunoyer) was a Lincolnshire man, and that district was then in advance of any other either in England or France. Of the present building, the south aisle was built first, and in the eastern bay of that is the only vestige of Norman work in the whole building; the billet ornament occurs on the rib mouldings of the vault in that bay only; the side wall is the one where the outer wall was erected first and the inner wall built up against it, which can be distinctly traced as before mentioned.

Bernini as an Architect.

The greatest architectural genius of the seventeenth century was Bernini, whose name is generally associated in architectural history with that of his contemporary, Borromini, as a corrupter of the style. He was sculptor and architect, and designed several churches, palaces, fountains and other works at Rome, among which may be noticed the palaces Barberini and di Monte Citorio, the churches del Noviziato de' Gesuiti and Gandolfo, the college of the Propaganda, and the fountains of the Piazza Navona, the Piazzas Barberini and di Spagna, the colonnade of the Piazza di S. Pietro, and the great staircase between the church and the Vatican. Bernini has sometimes displayed the highest art in the arrangement of light and in overcoming difficulties of situation, and his effects are occasionally inimitable. His style presents more licenses than absolute errors or abuses, and his graces and elegances go far to atone for his many faults. The porticoes forming the Piazza di S. Pietro, though they were calculated to make the want of columnar beauty and relief in the church itself more painfully felt than before, are in themselves one of the finest creations of Italian architecture. Columns had never before in modern times been employed in such profusion, or to the production of so great an effect.

Silvester's Remedy against Dampness.

The process consists in using two washes or solutions for covering the surface of the walls—one composed of Castile soap and water and one of alum and water. The proportions are three-quarters of a pound of soap to one gallon of water and half a pound of alum to four gallons of water, both substances to be perfectly dissolved in water before being used. The walls should be perfectly clean and dry, and the temperature

of the air not above 50 degrees Fahr. when the compositions are applied. The first, or soap wash, should be laid on when boiling hot, with a flat brush, taking care to form a froth on the brickwork. This wash should remain twenty-four hours, so as to become dry and hard before the second or alum wash is applied, which should be done in the same manner as the first. The temperature of this wash, when applied, may be 60 or 70 degrees Fahr., and this also should remain twenty-four hours before a second coat of the soap wash is put on. These coats are to be applied alternately until the walls are made impervious to water. The alum and soap thus combined form an insoluble compound, filling the pores of the masonry and entirely preventing the water from entering the wall.

French Wall-Papers.

The narrow width of the French pieces (18½ inches) makes the blocks more handy to handle, and they are kept a more uniform length than the English ones, which must be an advantage to the printers in the long run. It enables them to work down the side with facility, a method of pitching which is said to insure greater straightness in printing than working across the piece, while the extra width of the English blocks (21 inches) and the variations in the length of them, arising chiefly from the practice of using half and three-quarter blocks, make it almost imperative for English workmen to work across the piece. The use of blocks of extra lengths and widths up to 28½ inches wide, such as are often used here for large patterns, is a distinct disadvantage to a printer working on piecework, throwing his hand out for blocks of the ordinary size, and decreasing his power of production for a short time after each change. The French pieces, too, are only 9 yards long, which is an advantage in manufacture over the English 12 yards in some respects. It enables them to colour the whole piece on one long table without stopping, and to handle them generally more quickly and easily.

The Orton Waterville Pulpit.

In 1618 a pulpit was erected in Great St. Mary's Church, Cambridge, which is now in the church at Orton Waterville, near Peterborough—at least there seems every reason for believing this to be the St. Mary's pulpit, although it is only fair to state that there are other claimants for that honour. The parish books of Orton show the following expenses for the years 1748 and 1749:—"Paide to Dr. Long for the pulpet and desk, 3*l*. 3*s*.; Sam. Sharman, charges for going to Cambridge for the pulpet, and tolls, 9*s*. 5*d*.; Thomas Smart, for work done at the pulpet and bells, 8*s*. 11*d*." In these years Dr. Long was rector of the parish; he was also Master of Pembroke College, to whom the living belongs, from 1733 to 1770, so that it is probable enough that he would have opportunities of securing the old pulpit when the new one was placed in St. Mary's. The pulpit now at Orton is one of the most splendid specimens of Renaissance carving to be seen. It is octagonal, of great size and height, and stood originally on a pillar, which, however, has now been divided in half, and the lower portion perished. Each side is deeply recessed in a richly moulded arch, and at each angle is a small shaft, supporting a figure of the Alma Nutrix, which acts as a caryatid to support the upper ledge. It is in excellent preservation, and of course, being in a church which is plain almost to meanness, is the chief object of attraction there, and is famous in the neighbourhood.

Influence of Colour.

Considered intrinsically, the physically stimulating effects of colours fits them for a high office. The varieties of forms, aided by all the relief which light and shade can give, would be insufficient to enable us to discern objects clearly without the aid of colour. It appears that, throughout nature, colour serves this purpose only; and, if so, it may be said to approach the abstract idea of distinctness: there cannot be a better ground for considering it the chief auxiliary of beauty. As a source of distinctness, this adjunct gives importance to objects in nature as it does in art; yet, in examining the result, we should consider not merely its distribution among objects, but its relation to human vision—for the question is, how far our attention is attracted by it? In many cases, for example in the brilliancy of glowing skies and the splendour of light, the force of the impression does agree with the excellence of the objects and their associations. But innumerable instances might be adduced from the animate and inanimate world, where the emphasis of colour is lavished on things to us comparatively indifferent. On this point it is to be remarked that the vivacity of tints in flowers, birds and insects, for example, is generally unobtrusive, either from the minuteness of the objects, their short duration, or their rapid movement; and that in climates where such hues occur on a larger scale they are more sustained throughout nature, so that the eye is not startled by them; they are, under such circumstances, far less conspicuous than when they are transported to a more monotonous region.

NOTES AND COMMENTS.

THE society of artists known as the XX. having come to the end of their exhibitions in Brussels, a successor has been created having the title of La Libre Esthétique. The aims of the two are identical, viz. the promotion of novelty in art. The new series of exhibitions will not be confined to paintings, drawings and etchings. Applied art is also to be represented by examples of the creations of goldsmiths and other metal-workers, tapestry-weavers, bookbinders, clockmakers, &c. Several French artists have contributed to the exhibition, which occupies only a small part of the Musée Moderne, and this country is represented by Mr. CAMERON and Mr. FRAMPTON.

ONE of the strangest freaks of this season's gales is reported from Buda-Pesth. The Count EDMUND ZICHY brought a portrait of his late father, by HANS MAKART, to that city in order that a copy of it might be made by Herr KARDOS. He sent it by a servant to the painter's studio. The man took a seat beside the driver on an omnibus. As they were passing over the suspension bridge a gale of wind carried off the picture, and it fell into the Danube. Strange to say, the portrait did not again rise, and a work of art that was valued at 1,500*l.* has consequently disappeared.

NUMEROUS as are the books of engineering memoranda and tables, there is room for the new-comer which Messrs. CROSBY LOCKWOOD & SON have published. It bears the title of "The Engineer's Year Book," and is edited by Mr. H. R. KEMPE. Being of larger size than "Molesworth," it can contain the sort of information which is given in "Trautwine's" and other American pocket-books, and which used to be found in "Weale's" and "Alcock's." In other words, it supplies explanations and directions as well as formulæ. The "Year Book" contains about 600 closely-printed pages, and is arranged to answer the demands of mechanical as well as civil engineers. As far as we have examined the contents the information appears to be accurate, and it is derived from many authorities. Mr. KEMPE has performed his editing carefully, and the "Year Book" deserves to become one of the most successful of the technical annuals.

THERE is no publisher who has shown better taste in the "getting-up" of his books than Mr. ELLIOT STOCK. The prices are moderate, and the binding must therefore be in "cloth," but every volume has something pleasing about its appearance which entitles it to a place among costlier books. The Elizabethan Library is one of the publisher's most interesting series, and as the last volume consists of "The Love Verse from the Minor Poems of Edmund Spenser," edited by the scholarly Mr. A. B. GROSART, it is needless to say the contents are delightful. Those who contrive to keep up to the death of the Beast in the "Faerie Queene" were once said to be very few and very wearied, but the love-poems can afford enjoyment in every line. Unlike the majority of their kind, they are sincere, for SPENSER was really attached to his wife, ELIZABETH BOYLE. The sonnets deserve to be compared with those ascribed to SHAKESPEARE, and the two collections will serve better than TITIAN's picture to suggest the differences between sacred and profane love.

READERS of Mr. THOMAS HARDY's "A Laodicean" will remember how GEORGE SOMERSET, the young architect, first found his way to Stancy Castle by the aid of the humming of the telegraph wire which the heroine had set up. On that occasion "the wire sang overhead with dying falls and melodious rises that invited him to follow; while above the wire rode the stars in their courses, the low nocturn of the former seeming to be the voices of those stars 'still quiring to the young-eyed cherubim.'" Many novel readers of a realistic turn may have believed when they read the passage that Mr. HARDY was forgetting his principles of composition, which have an artistic rather than a scientific tendency, when he introduced a relationship between the music of the spheres and the vibratory sounds of a telegraph wire. But the lecture which Mr. W. H. PREECE has just delivered at the Society of Arts on "Electric Signalling without Wires" confirms the novelist's suggestion. In his remarkable conclusion he said:—"Strange, mys-

terious sounds are heard on all long telephone lines when the earth is used as a return, especially in the calm stillness of night. Earth currents are found in telegraph circuits, and the aurora borealis lights up our northern sky when the sun's photosphere is disturbed by spots. The sun's surface must, at such times, be violently disturbed by electrical storms, and if oscillations are set up and radiated through space, in sympathy with those required to affect telephones, it is not a wild dream to say that we may hear on this earth a thunderstorm in the sun. If any of the planets be populated with beings like ourselves, having the gift of language and the knowledge to adapt the great forces of nature to their wants, then if they could oscillate immense stores of electrical energy to and fro in telegraphic order, it would be possible for us to hold commune by telephone with the people of Mars."

A BILL to regulate buildings has been prepared for South Australia, but apparently it is not more perfect than was the first Building Act for London. The South Australian Institute of Architects have accordingly appointed a sub-committee to suggest amendments to it. During the discussion some of the members called attention to the fact that the Act did not regulate in any way the quality of mortar to be used in suburban houses, which was a matter of the first importance, for they might legally be built with "pug" without any lime. Several other amendments are needed if the Legislature desire to prevent jerry-building.

THE fourth volume of the "Sketch-book of the Glasgow Architectural Association" which has appeared is rather disappointing, for it is not easy to trace an improvement on the plates in the earlier volumes. Whether the defects are due to the drawing or the reproduction, or to both, we cannot decide, as we have not seen the originals. The most careful plates among the measured drawings are those from the crypt of Glasgow Cathedral, but in that case there happened to be some emulation among the members. There are a couple of plates of ALEXANDER THOMSON'S Neo-Grec churches, which are excellent subjects for geometrical drawings. If the contents of the volume were confined to his work much advantage would be derived by the draughtsmen. Among the freehand drawings one of St. Mary's, Oxford, is the most effective. The disadvantage of trusting to pencil lines is suggested by a plate from Heriot's Hospital, for whatever was definite has vanished, and little more than a few brush strokes remain. In such cases the want of experience is evident. Apparently a member is left to find out the best course to adopt for himself. If one of the editors of the London Association Sketch-book could be persuaded to give the Glasgow students the benefit of his experience, especially about drawings that turned out failures, a great improvement would be sure to follow in the succeeding volumes.

THE Cardiff Town Council are showing shrewdness in avoiding premature conclusions about the contemplated Municipal Buildings. At the last meeting there was a step forward, since the following resolution was unanimously adopted:—"That after full discussion of the requirements of the county borough for law courts, police arrangements and municipal purposes, it is resolved that the present buildings be reserved, with improvements for the assizes and all dependent departments, county court, quarter sessions and police business, and a separate structure be provided, on a site as near as possible to the present Town Hall, for all the necessities of the municipal work of Cardiff." The determination will, of course, put an end to all schemes for bringing legal, civic and administrative business under one roof. The question has yet to be settled where the eligible site for a Municipal Building near the present Town Hall is to be found. The Marquis of BUTE would allow one to be taken from the Cardiff Arms Park, but at the price of 25,000*l.* an acre, or say 50,000*l.* for an adequate site. At present the Council hesitate about paying so large a sum, and it is assumed that steps could be taken which would enable them to obtain the ground on more economical terms. But after all the Marquis of BUTE has done for Cardiff, it is not complimentary to him to suggest that he is asking more than its value for a piece of land.

PARISH CHURCH, HAMPSTEAD.—WEST END.

NEW CHANCEL, PARISH CHURCH, VERWOOD, DORSET.

THE new chancel of the church of St. Michael and All Angels has been built of stone from the designs and under the superintendence of the architects, Messrs. ADYE & ADYE, M.S.A., of Town Hall Chambers, Bradford-on-Avon, and the work has been carried out by Messrs. HAYWARD & WOOSTER, of Walcot Place, Bath. At the entrance of the chancel is a panelled alabaster screen and wrought-iron gates. The altar is approached by seven polished Devonshire marble steps, and the floor of the chancel is paved with glazed tiles from Messrs. MINTON, HOLLINS & Co. The roof is formed of oak timbers, moulded, the principals resting on carved corbels. The choir stalls are also of oak panelled to correspond with the chancel screen. The arches of the sedilia and piscina are supported on polished marble columns, and the label over is supported by carved figures of angels playing respectively the harp, the cymbals and the flute. On either side of the east window (terminating a string-course) are two angels in the attitude of adoration, holding the host and the chalice. The altar is of oak, with open panels and a marble top inlaid with the usual five crosses in brass. It is surmounted by three re-tables supporting the usual ornaments, and at the back is a dossal formed of a warm-coloured red damask, with wings of silk plush and side hangings of red and gold brocade.

BUSINESS PREMISES, UTTOXETER.

THE premises represented have been erected for Messrs. HENRY BAMFORD & SONS, in the Market Place, Uttoxeter. The work is executed in white Hollington stone, and has been very well carried out by Messrs. ISAAC WARD & SONS, of Uttoxeter. The carving is by Mr. GILBERT SEALE. The architect is Mr. W. T. WALKER, 5 West Street, Finsbury Circus, E.C.

ROOM IN ROYAL HOTEL, BIDEFORD, NORTH DEVON.

ILLUSTRATED JOURNALISM.*

ENGRAVING, and I use the term in its widest significance, and embracing therein all photographic reproductive processes whatsoever, may be roughly divided into two main divisions, into one of which every plate and block, from which an impression is taken upon paper, naturally falls. The first of these is "relief" engraving, so called from the fact that the lines, by means of which the picture is produced, project in relief from the block, whether that block be of wood, metal, or even of stone. In the second, which is termed for want of a clearly definitive English expression, "intaglio" engraving, the lines are, on the contrary, sunk below the surface of the plate. To obtain an impression from the relief block, all that is necessary is to prepare the latter by passing thereover a roller charged with printing ink. This adheres to the raised portions, which subsequently become the lines of the print, and leaves untouched the sunken surfaces which are to represent the white spaces. When, therefore, a sheet of paper is placed on the top of the block and pressure applied thereto, it is the raised places only which transfer their inky coating to the surface of the paper. The principle of printing from an intaglio plate is diametrically opposed to this. Here the entire surface of the plate is, first of all, covered with the ink, this is then carefully wiped away from the surface or open spaces and left remaining only in the sunken lines and depressions. When paper is forcibly impressed upon this plate it takes up the ink from these latter alone, the main surface of the plate leaving no record.

As a matter of fact, a print from an engraving or intaglio process consists of a species of cast, as it were, the paper being forced into the lines, impressions from which are therefore raised above the main surface of the paper in print. The reverse takes place in the case of a relief block, the lines of which are depressed below the surface of the paper.

Of relief printing, the most familiar example is the page of an ordinary book printed from type. Of intaglio printing, the most commonplace example is an ordinary visiting card.

I am particular, at the outset, to impress upon you these fundamental differences, as without a proper comprehension of the contra-distinctive nature of these divisions of what we somewhat loosely term engraving, the difficulties which have beset the path of the newspaper illustrator would not easily be comprehended.

A newspaper, as I need hardly say, is printed from type, and type is, in its essence, a form of relief engraving. It becomes absolutely necessary, therefore, that pictures which have to be printed side by side with type should be engraved by the relief, and not by the intaglio process. This is a conclusion the full bearing of which upon the subject does not appear, until it is pointed out that the most artistically satisfying reproductive methods are to be found in the ranks of the intaglio processes.

Of relief engraving, the parent undoubtedly is xylography, or wood engraving. In regard to its claims to considerable antiquity I need not detain you, beyond mentioning that its practical popular extension, to any considerable extent, depended upon the invention of paper, for upon paper alone could any considerable number of impressions be taken. It is true the East has for centuries furnished us with fabrics of silk and other stuffs, the designs upon which were printed from wooden blocks, but this can hardly be called a reproductive process in the sense in which we are at present considering it. Thus, as the manufacture of paper practically dates from the first part of the fifteenth century, so about this time we come upon the earliest indications of successful wood-cutting.

The first xylographic specimen of which we have positive knowledge, dating from 1414, has been preserved for us in the museum at Brussels. I have promised to spare you any unnecessary historical divagations, but I should like to point out that the first important step forward taken by the art was in connection with what may not unfairly be called the earliest illustrated newspaper. This was the *Nuremberg Chronicle*, published in 1492, which contained something like two thousand engravings by Wohlgemuth, the master of Albert Dürer. In the blocks which illustrate the chronicle we find for the first time the employment of cross-hatching, a technical method by which tones of varying intensity are produced, which opened the eyes of contemporary artists to the inherent possibilities of the craft. But from the days of Wohlgemuth, Dürer, Cranach, Burgmair and Aldegrever, names and a period upon which I should be delighted to dwell at length, I must take a sudden swoop through the centuries until I arrive at our own generation. I am considering this evening more particularly the subject of illustrated daily journalism, and illustrative daily journalism came into real, breathing, palpitating existence only by the aid of the photographic camera.

Almost, if not literally, from the day of Daguerre the problem of producing, by photographic methods, blocks or plates from which, by purely mechanical means, a number of impressions could be taken, has occupied the minds of experimentalists. They were led almost at once on the right track by the experiments and discoveries made by Niepce, Monge Ponton, Poitevin and others, who discovered that various organic substances, such as gelatine, gum, albumen, and so forth, when mixed with a solution of bichromate of potash and various other salts of chromium, became curiously affected by the action of light. Though perfectly soluble under all conditions, without such admixture those portions of the bichromated gelatine, for instance, which were exposed for any time to the action of light, became absolutely insoluble in water. It was evident, therefore, that if a film of gelatine or albumen which had been rendered sensitive by bichromate of potash were to be exposed under a negative, those parts to which light could reach through the clearer portion of the negative would become insoluble, while those which were protected by the dense parts of the negative would still remain soluble. Thus, a film of gelatine, after exposure for a proper length of time under a negative, might be washed in warm water with the following result:—The high lights, which in the negative are dense, and therefore shield the film from the light, would be washed away, while the shadows which in the negative are clear glass would remain unaffected by the action of the water. If a positive instead of a negative were superimposed, the reverse would be the case—that is, the high lights would remain at the height of the normal surface of the gelatine, while the shadows would be hollowed out to a greater or less depth. Roughly speaking, it is by the first of these methods that relief blocks are obtained, while by the second photographic intaglio plates are produced.

Simple, as starting from these premises, the problem may seem, as a matter of fact it bristled with technical difficulties, and though it was in 1839 that Monge Ponton first published the fact of the sensitivity to light of chromium salts, it is only within the last decade that relatively satisfactory results have been obtained from photographic plates and blocks. The great difficulty which had to be overcome was the production of what is known as half-tone. An ordinary line drawing in black and white could be easily reproduced in the form of a relief block or an etching. Thus a plate of zinc, in one of the forms

* From the paper by Mr. Horace Townsend, read at a meeting of the Society of Arts.

of process etching most commonly in use, is covered with a bichromated film of albumen. On this a negative of the line drawing which it is wished to reproduce is superimposed, and the two are exposed to the action of light. The clear glass of the negative, which represents the black lines of the drawing, allows the light to freely penetrate to the film of albumen.

After a sufficient exposure the plate is washed, and by this means all that portion of the film which has not been acted upon by the light disappears. If these lines be now protected by a coating of some such substance as printer's ink and the plate immersed in a bath of acid, the unprotected spaces will be eaten away, while the lines protected by their hardened film will remain untouched, and a relief block is by this means produced. If, however, it is desired to make a process block from a drawing in wash, or from a painting, there are only two ways in which it can be done. Either those parts which are to print black or grey may be sunk to various depths below the general surface, and some mechanical means taken by which they will hold the ink, which, after being applied generally to the entire plate, is rubbed off carefully from the raised portions or lights, and an impression taken from the intaglio plate thus formed by the ordinary methods of copper-plate printing. This, under the most favourable circumstances, is a slow and expensive process, and cannot be worked in conjunction with ordinary printing. The desideratum, therefore, not only for newspaper illustrations, but for those of books and magazines, is a relief block which shall be able to print the graduated shadows, which are generally known as half-tones. As a matter of strict fact there is only one tone in any relief block, the half-tones or graduated shadows being produced by broken lines or dots of the absolute black, or at all events the single colour of the ink employed. The closer together these dots and dashes of black are placed, the darker will be the shade, while the further apart they are the lighter will the resultant tone be. This is, in fact, true, with one exception, of every form of engraving, photographic or otherwise, as even the delicate gradations and practically exact tonal values of the finest mezzotint are produced only by the relative closeness together or distances apart of the minute little bits with which the surface of the copper-plate is initially overlaid, and which are scraped away to form the high lights, and thinned down and made smaller and shallower by the scraping processes to form the intermediate tones.

The exception to which I refer is the photo-mechanical process known as the Woodbury-type, after its inventor, the late Slater B. Woodbury. Not to confuse you with unnecessary details, I may say that these processes consist in producing an intaglio in the ordinary way by the use of bichromated gelatine. The delicately shallow mould which is thus produced is filled with a thin ink lying more deeply in the shadows, and in the thinnest of possible films on the higher lights. When this ink is printed off on to the paper and allowed to dry, the darker shades are represented by a thicker and darker pigment, and a truly-toned picture is the result. In relief printing, half-tones must be reproduced by some sort of stipple or lines, or dots, as in the case of an engraving. The most ordinary process now in vogue to bring about this result is the employing of a fine network of criss-cross lines, which is interposed at some stage of the operation between the negative and the sensitised film. By this means the half-tones are broken up into a series of dots or lines which can be printed from after the manner of ordinary type.

Herr Meisenbach, in Munich, patented in 1882 a variation on this process, which is thus described in his own specification:—"The transparent plate is hatched or stippled in parallel lines. A transparent positive is made of the object which it is desired to depict. The two plates are joined preferably face to face. From the combined plate a negative is photographed in the ordinary manner. In order to cross-hatch and break the lines of the shading, the hatched or stippled plate may be shifted once or more during the production of the said definite negative. This negative is transferred in the usual manner to form a typographic block."

The greater the fineness of this network the more perfectly illusory is the resultant half-toned plate, and I may add that this screen, as it is termed, is usually produced by making a photographic reduction of one which is already ruled as finely as ordinary mechanical means will permit.

In order to reach the desirable end of breaking up the tones, other methods, as I have said, besides those of the Meisenbach screen are used. Thus one of the chief American inventors in the photographic process field, Mr. Frederick Ives, of Philadelphia, some years ago patented the half-tone process named after him, from which most artistically satisfactory results have been gained.

He used, I believe, a rubber pad on the surface, to which there were cut at right angles to each other minute V-shaped grooves, through whose agency the surface was thus converted into a series of tiny little combs. These are inked not only on the points, but on the sides. From a gelatine relief, inked in the usual way, by exposing a bichromated film under a negative and then washing away the unhardened portions, a plaster of

Paris reproduction was formed. Upon this was pressed the inked rubber pad, and the relief lines and surfaces were varyingly impressed with a series of inky dots which, owing to the expanding nature of the rubber, were larger where the pressure was greater owing to the relief being higher and smaller where the relief was lower, and so was either not reached by the little points at all or did not flatten them out. The shadows, which were in relief, were thus rendered by a series of larger dots, while for the highest lights the white surface of the plaster was left intact. Of this dotted rendering of the relief a photograph was then taken, and the negative thus obtained was used to prepare a relief block by any one of the ordinary processes. From some points of view the result is preferable to that of a Meisenbach block, for what is termed a differentiated grain is offered to us in place of the unvarying and mechanical grain, which alone can be produced by the netted screen.

The superior artistic quality of a differentiated grain is due to the fact that the largest dots are confined to the heavier and the smallest to the lighter of the tones, a truer gradation in tint resulting.

I have dealt, I trust you will not think at an inordinate length, upon the principles of photographic process engraving and etching (whichsoever, of two terms neither of them precisely correct, one may the more fitly employ) for two reasons. In the first place, I have always found the most surprisingly vague and hazy notions existing in the mind of otherwise well-informed people regarding the difference between an etching, a steel engraving and a woodcut, and as the limitations of illustrated journalism are dependent entirely upon these technical differences, it is as well at once to get the main principles plainly set out before us. I have confined myself to the photographic processes, because, as I have already hinted, the true history of illustrated journalism, as we understand it to-day, began to be written when Poitevin produced his first plate, etched by the indirect agency of the photographic camera. It is interesting maybe to refer, as I myself have briefly done, to the *Nuremberg Chronicle*, or, coming nearer home, to the occasional appearances in the earlier "Diurnals" and "Messengers," which took the place in some degree of our modern newspapers, of rude woodcuts which, in more or less haphazard fashion, aimed at eking out the scanty and brief written account of some happening of unusual importance. But it is interesting only as affording conclusive evidence of the inherent desire of people of all ages and of all centuries to stimulate their imagination by graphic representations of the persons or objects concerning whom they are reading.

It is not indeed of any much greater practical use to give more than a passing glance at the weekly story papers, which were the earliest examples in our own century of what may be called illustrated journalism. These had a part to play in its development, and played it well. They taught the people to look for illustrations as a welcome addition to their current literature, and they assisted in the formation of a school of illustrators, who for many years led the van of progress in the world of black and white art. It was on the *London Journal*, for instance, if I remember the name aright, that Sir John Gilbert first manifested those extraordinary powers of facile draughtsmanship and rapid execution which, had he begun his artistic career in the "nineties," would have made him probably an ideal daily newspaper illustrator.

Haste was a main factor in the carrying out of the work, both literary and artistic, on these periodicals. It is a tradition, indeed, that just as a printer's devil was wont to sit waiting in the hall of the author while the latter scribbled the concluding lines of his week's instalment of the current "to-be-continued-in-our-next" narrative, so the lad from the engraver's would wait upon Mr. Gilbert with the wooden block, on whose surface the rapid pencil of the illustrator was to sketch the lovely form of the heroine in some moment of poignant distress, with instructions from his master not to leave the house until the drawing was made. This haste and procrastination sometimes led to consequences which might have been disastrous had the readers of the journal been more exacting or more gifted with artistic perspicuity, for the artist would shirk the onerous task of reading the manuscript which he was illustrating, and making a sketch entirely "out of his own head," as the children say, would depict his hero and his heroine under circumstances which, though doubtless picturesque, had not unfortunately the faintest resemblance to any of those described by the unhappy author. But this rapid, if perfunctory, method of working led to a corresponding facility and speed of execution in the case of the wood-engraver, and so prepared the way for the rapidity of execution which was necessary when the weekly papers, and notably the *Illustrated London News*, which professed to give every week pictures of current events, came into existence. As time went on, and as the *Illustrated* waxed in importance, and was hard pushed at one time or another by its more or less successful rivals, this rapidity of production became of the utmost importance. The appetite of the public for illustrations of current events which should appear in the pages of the weekly papers within a few

days of their happening at the farthest, grew with what it fed upon. It was no longer possible either for pictures to be prepared beforehand bearing only a remote and conventional resemblance to the actuality of the subject they professed to illustrate. They had to be drawn from actual sketches taken on the spot by "Our Special Artist."

Now, as wood-engraving is a slow and laborious process at the best, and as the blocks required to satisfy the public taste had to be greatly increased in size, not a little ingenuity was necessary in order to overcome what were apparently the mechanical impossibilities of the task. The means finally hit upon was an ingenious one, and one which is not only in vogue to-day, but which were it not for its exceeding expense might have perhaps prevented the daily newspaper illustrator of to-day from his entire dependence upon the photographic processes, and thus doubtless have hindered the extraordinary developments in the last-named field. The wood block on which the picture was drawn was formed of a multiplicity of small blocks carefully fitted together and bolted firmly up so as to form a homogeneous whole. On this surface the design was drawn, the bolts and screws connecting the parts were taken out, and one portion of the subdivided picture, which thus resembled a child's puzzle-block picture, was given to each engraver, who set to work on his particular little square with all speed. When each had finished his work the blocks were once more screwed together, and a large woodcut was thus produced in a twentieth or thirtieth part of the time in which it could have been accomplished by the ordinary method.

There was for many years no temptation to the process engraver to produce anything but the cheapest work, and the cheapest, as we all know, is, has been and always will be the nastiest. For their best effects the great weeklies were perfectly content to remain steadfast to the wood engraver. The latter could at least, by the method to which I have referred, produce his blocks within as short a space of time as the needs of weekly publication rendered necessary, and if they cost a little more than others, why, the proprietors were making at least living profit, and what did it matter?

But this attitude could not for long be maintained. The happy results which attended the unremitting efforts of Continental and Transatlantic process workers began to attract the attention of the proprietors of English illustrated papers, until slowly, but surely, the process block began to oust the engraved wood block from its position in the pages of the weeklies. At first, indeed, the reaction from the primary indifference was, as all reactions are, excessive, and the cry went up that the occupation of the wood engraver was gone. So far from this, we see to-day that the very growth of process work has elevated the art of the wood engraver, and though the weaklings and useless have been killed off, the masters have received no such recognition, pecuniary or otherwise, since the modern school of the art was almost created by Bewick. Firm as is the belief I hold in the almost unlimited possibilities of photographic process, I should be sorry to think that its growth meant the extinguishing of the radiant light of one of the most glorious of the reproductive arts. But the daily papers were slow to grasp the opportunity, nor yet have they made up their minds to give more than a tentative shake to the tree which, in another country, has been found to bear such golden fruit. A few outline portraits, poor alike in conception and execution, and which are rendered still poorer by incompetent printing, and an occasional architectural sketch, mark almost the furthest point to which the afternoon dailies have advanced.

Some 3,000 miles away, however, in the United States of America, a very different state of things prevails. That daily journalism in America should have made advances, coy at first, but later on more passionate, to the muse of illustration—if such a one there be—is due, in my estimation, to no extraneous or easily definable cause, but to the entirely different position which journalism holds in that country compared to this. The American newspaper stands to a majority of its readers in the place of literature in general. But this, I think, is not because the readers have no taste in themselves for literature, but because the newspaper endeavours, as nearly as may be, to be in itself a compendium of literature. It is a sort of octopus, whose long and ever-active arms clutch from every quarter of the literary and journalistic field, and convey to the main body, there to be digested, whatever they may find of energy and enterprise. Let this voracious creature find that there is a demand among the people for serial fiction—let me say, for example's sake—which is being supplied by some publication specially devoted to this field, and one of its tentacles immediately becomes active and adds fiction to the main body. Are certain journals supporting existence by catering to those classes which are interested in sport, or in music, or in the drama, or in art? Immediately the daily adds departments of sport, music and so forth, which, owing to the numerous capital at command, are even more efficiently carried out than they would be in the specialists' hands. It was, in my opinion, the striking advances in the art of illustration made by the American magazines, advances which form almost a

commonplace of comment in Europe as well as in America, that led the newspaper proprietors in the same direction.

Tentative at first, and not very promising, were the illustrative experiments made by the New York dailies. They were confined to the simple outline portraits and sketches which it was then possible for photographic process to produce for the needs of rotary printing. I may be pardoned if I digress here for one brief moment to point out that the ideal method of printing, so as to gain the most satisfactory results, either from type or engraved blocks, is the old-fashioned hand-press. Next to this comes flat-printing by machinery, in which the sheet of paper is automatically pressed down upon the body of type which lies in a horizontal position. The daily newspaper, however, with its circulation of hundreds of thousands, must be printed on what is termed the rotary press. The actual type in fact, which is set up by the compositors, is not printed from at all. Instead, a sort of mould of it is taken in moist paper, which is subsequently so dried and hardened that when it is bent into a semicircular form a cast can be taken from it in type metal. Two of these casts put together then form a cylinder which, when placed upon an axle, inked and revolved at a high rate of speed, prints upon a sheet of paper which is made to travel beneath it many thousands of impressions per hour. It was the practical difficulties connected with this rapid form of printing which caused newspaper illustration to be looked at askance for many years. It was not, indeed, until the *New York Herald*, with its great circulation and the almost unlimited capital which was behind it, took the matter up and resolved to enter seriously into competition with the publications which relied upon their illustrations alone, that any marked developments began to show themselves. These followed each other, however, with extraordinary rapidity. They all had been theoretically possible, and it only required the nicest mechanical adjustment to turn them into actual facts. Process work under the kindly stimulus of the magazines, such as the *Century* and *Harper's*, had been making gigantic strides. In line work the reproduction of the finest lines and the most intricate and closest of cross-hatching and shading had become not only possible but easy, while the half-tone processes had rendered the exact simulation of wash drawings an everyday affair. The necessary element of speed, too, was not forgotten, and carefully finished blocks were turned out within the space of a few hours, which, not many years before, would have required almost as many days for their efficient production. The printer, too, kept pace, to some extent, with the process engraver. He very soon discovered that the finest of lines left its impress upon the papier-mâché matrix as well as the coarsest, and that the stereotyped cylinder cast therefrom rendered it in the required relief with scrupulous fidelity. Even that mystery of mysteries, the overlay, was partially overcome, and yet, with all these advantages, newspaper illustration was at best a somewhat unsatisfactory performance. It had taken many years—more than a lifetime, in fact—to so perfect the news-gathering system of the American newspaper that it should work smoothly without friction and as one harmonious whole. It was not to be wondered at therefore that there was more promise than performance in the early attempts in this direction, even of the greatest of the daily journals. Artists were slow at first to understand that, just as a newspaper writer has to eschew certain literary graces and appeal forcibly and directly to his audience, so the newspaper illustrator has to lay aside some of his pet conventionalities, admirable as they might be elsewhere, of artistic expression. Process workers hesitated at throwing overboard traditions and methods which, though recently acquired, were none the less deep-rooted. Plates which should have reached the composing-room at one hour straggled in during the course of the next, when, owing to the exigencies of the "make-up," they might just as well not have made their appearance at all. It took but a very short time for the proprietor of the *New York Herald* to see that either a radical change was necessary, or that the task of illustration had better be left to the weekly and the monthly publications.

He decided upon the former course, and made at once the illustrator and the engraver an integral part of the general machinery of his newspaper office. His example was to a certain extent followed by others, and then, and not until then, newspaper illustration in America took the enormous stride forward which tends to give promise even now that at no very distant date the daily paper will take the place in the affections of the picture-loving people, not only of the weekly journal, but even of the monthly magazine. A staff of illustrators work in the *Herald's* new building side by side with the staff of reporters, and while the latter are employed in scribbling off their copy, the former just as quickly sketch the main incidents of the event which is being described. While the reporter's copy goes into one part of the building to be set up in type by the compositor, the illustrator's drawing goes into another department to be photographed and engraved, without the loss of one second by the process workers. In like manner, just as carefully collected news memoranda are preserved which will

be useful should reference be made in the course of an article or a news despatch to some noted personage or famous place, so portraits and views are collected with unwearied diligence and care, fully filed away for the artist's reference upon the instant of necessity. Again, just as from time to time it has secured the services of some prominent or literary man to add some special daintiness to the literary fare set before its readers, so the *Herald* is wont, as occasion may arise, to supply them with facsimiles of the artistic impressions of painters and draughtsmen of world-wide reputation. That a journalistic departure from the beaten track attended with such difficulties, mechanical and otherwise, should have been marked by an immediate degree of success is little short of surprising; that perfection should not at once have been attained is not to be wondered at.

For the past decade the problem of colour-printing, otherwise than by lithography, has monopolised the attention of process workers in Paris, Vienna, New York, and in one case at least, in London. Without attempting to discuss the matter from the empyrean heights of abstract art, I may, perhaps, be permitted to take for granted that, in popular estimation, a coloured picture is more attractive than one in simple black and white, for it leaves so much less to the imagination—a function in which the average man is woefully deficient. Starting on this hypothesis it was evident that a process which would admit of the printing of a block in several colours conjointly with type, would be of enormous commercial value. The problem of intaglio colour production by photographic process had been triumphantly solved by Goupil, of Paris, who, however, employed the most careful of hand-printing to attain his results, and who after all rivalled and did not excel the results produced in our own country a century ago by that school of mezzotint engravers whose artistic value we are only to-day realising. It is, indeed, the printer rather than the process maker who has retarded the development of a relief colour-printing, for it is clear to those who have the most elementary knowledge of the theory of lithographic printing, wherein a multiplicity of shades of colour are produced by the superposition of the primary and secondary colours, that a series of relief plates to serve the purposes of the various tint stones of the lithographer could be easily prepared. As a matter of fact, this has long been possible, and Mr. Hare, of our own city, to-day turns out process blocks for relief colour-printing, by means of which the most delicate gradations may be employed. A machine for printing these at a high rate of speed was, however, the desideratum. At first, the nearest approach to this was a press which printed colours in mosaic only. That is, each tint had a separate block, and no attempt was made to secure effects by gradation, or by the printing of one colour over another. Very charming effects, as the French have shown us, can be produced in this manner, but it yet stopped short of what was needed, especially as the process was a comparatively slow one. Then the proprietor of the *Petit Journal* invented the quick press which bears his name, and which is, in this country, used by the proprietors of *The Million*. In America, as the *New York Herald* coloured supplements will show you, an even closer approach to complete success has been made. These pages are printed on a press of the "Hubert" pattern, which prints at a high rate of speed and gives two colours at one feeding. Within a week or two, however, the "New Hoe" press, which has taken many months to build, will be in running order. This will produce much more elaborate work, printing eight pages in four colours from a continuous roll of paper at a speed of many thousands per hour. Should it indeed do nearly all that is confidently claimed for it by its builders, it will almost revolutionise the art of colour-printing from a rotary press.

I should not, however, like to say that the problem of colour-printing will be solved even when a press which will print its eighty or ninety copies a minute is built, and is found to work with consistent exactitude. So far we are all, artistically speaking, groping more or less in the dark, and in some directions, at all events, the popular work of the day is hopelessly away from the proper track. To take an ordinary wood engraving or process block and smear a lot of colour over sundry portions is not the way to produce a colour print, though in some quarters—which I need not particularise—this fallacy seems to have gained ground. The machines and the mechanical executants may be as perfect as in this imperfect world of ours is possible, but the right material to work upon must be given them at the start, or the results will never be more contemptible. That it is comparatively easy to produce an exact facsimile of a water-colour sketch, provided certain limitations have been frankly recognised by the original artist, some of the exhibits which I show to-night amply prove; and so it comes to this, that it is to the artist rather than to the printer or the process maker that we have to look for improvement.

Centuries ago, half of the problem was solved for us by the Japanese, and I only wish it were possible to show you to-night some of those exquisite examples, informed from start

to finish with creative beauty and yet subservient to the truest principles of reproductive art, which are at present being exhibited here in London in a well-known art gallery.

Much of their finest effect is due, of course, to the fact that the touch of the artist has been present at every stage of their production, and a major portion of the beauty therefore we can never, so long as the world shall roll, hope to rival by mechanical means. But the underlying principles which are based on their instructive appreciation of the balance of tones and on their masterly use of broad colour effects, to which delicacy is imparted by subtle though simple gradation, may with advantage be studied by the colour draughtsman for process reproduction of to-day. Finally, the limitations of the process must be frankly recognised and borne in mind from the first moment that the artist lays brush to paper, and it will then be found, as in the case, for instance, of such other branches of art as stained-glass work and mosaic, that these very limitations may, instead of curses, prove blessings, and perhaps the chiefest of artistic glories.

THE OBSERVATION AND CREATION OF BEAUTY.

THE annual meeting of the friends of the Municipal School of Art, Birmingham, was held on Wednesday in last week, when Mr. William Morris delivered an address. According to the *Birmingham Daily Post*, Mr. Morris said he had first to speak to the general public about the art which their school represented, and next to the students of the school about their position and aims. We were not yet quite on the right road towards a satisfactory condition of art. When he said "we" he did not mean this country especially, for though in France, Germany, Italy and elsewhere there were still more or less survivals from foregoing periods during which art was common to the whole people, those survivals were being extinguished under our very eyes, and in the course of a few years there would, for example, be nothing more interesting in the peasant life of Italy than in that of England or America. All nations must go through the mill in which the commercial period is grinding us, and England had at least this advantage that she was thrown into the hopper first, and as a consequence was showing signs of a consciousness that there was a future for art. In short, we were willing to rebel against the tyranny compounded of utilitarianism and dilettanteism, which for the greater part of this century had forbidden all life in art. As yet, however, we did not quite know what form our rebellion was to take. As to this, he felt that he could not do more than generalise, and he would say, first, that in order to have a living school of art the public in general must be interested in art; it must be a part of their lives—something they could no more do without than water or lighting. They must not be able to plead poverty, as they did now, as an excuse for ugliness or dirt. If they raised a building, whether it were a palace, factory, or cottage, it must be a thing well understood that it must be sightly. If a railway had to be run from one place to another, it must be taken for granted that the minimum of destruction of natural beauty must be incurred, even if that should increase the cost of the line largely. Disfiguring waste of coal-pits or manufactories must be got rid of, whatever the cost might be, and so on. And, mind, all this, which was the only possible foundation for art in modern times, was quite possible to be done, and would be done as soon as people cared about it. To put the matter quite plainly, as things went now we as a community were content to be publicly poor so long as some of them were privately rich. Though the income of the country was enormous in figures, no man could go a few yards from his own door without seeing the tokens of quite desperate public poverty. He admitted that within the last dozen years there were signs of healthy discontent with this monstrous discrepancy between our powers and our practice, and in one direction especially a new spirit had arisen which, to begin with, had given us instruments through which the revolt against stupid utilitarianism could work. He alluded to the development of municipal life among us. He knew how Birmingham had for long taken a leading position in this development, but now they were seeing what some of them had scarcely expected to see, London playing its part herein, and that in spite of its being so weighted by its unmanageable size and its position as a centre of government, of politics and of intelligence—that was to say, in spite of its being of all places in the world the very representative of the commercial epoch. Whatever mistakes the London County Council have made, it was awake to the fact that it owed to the citizens some account of the external decency of their brick and mortar county, and there was a feeling that something might be done even in these passing years to make life better worth living in London. All things considered, he believed there was a growing sense that it was a disgrace to a period in which mankind

had gained such mastery over the forces of nature that the commonwealth should be so poor. Such a feeling was and must be the basis of modern art striving to free itself from the thralldom of utilitarianism, and the Correggiosity of Correggio. In considering the question, How were we to work on this basis, and the hopes there were of art in these islands, Mr. Morris disputed the dictum that used to be popular in dilettante circles that the English were essentially a non-artistic people. As a matter of fact, until art failed throughout civilisation the English had a very definite style of art of their own, which closely expressed their thoughts and their lives, and of which beauty—almost, it seemed, unsought for—was an essential part; while, as far as our own days were concerned, it was, as he had said, to non-artistic England that some glimmer of insight into the possible future of art had come. In short, it was no use going further afield than this country to find the artists and craftsmen that we need. Although the capacity for art, and the desire for it, was not yet extinct among us, yet it was mostly dormant. People in general who did not earn their livelihood by using their eyes did not use them; which, of course, considering the state of the popular arts amongst us, saved them a great deal of suffering, and probably lengthened their lives. It was, however, desirable to awaken them to that “divine discontent” which was the mother of improvement in mankind.

The essential thing was that people generally should be capable of receiving impressions through the eyes, and this process should be a joy to them, just as their receiving impressions through their palates or their ears. In order to get people to use their eyes, those who had not lost the use of their eyes should go on pestering the rest of the public until they had more or less convinced them that it would be a good thing for them to recover their capacity for seeing, just as it would be a good thing to recover the use of their legs if they were lame. There were two things to be done by the seers for the non-seers: the first was to show them what was to be seen on the earth, and the next was to give them opportunities for producing matters the sight of which would please themselves and their neighbours and the people who came after them—to train them, in short, in the observation and creation of beauty and incident. What then was worth seeing on the earth? Everything. This to love and foster, and that to hate and destroy. Speaking more of those things which the eye bade us to love rather than those which it bade us hate, Mr. Morris said there were two kinds—the beauties of nature and the beauties of art. Concerning the former our fault was that, for the most part, we refused to pay attention to anything in nature which was not tremendous or exciting. It must be an Alpine pass or a rocky sea-shore, or the richness and luxury of an Italian landscape, or at least a piece of mountain in Scotland or Wales. Less than that would scarcely draw our eyes to the beholding, yet he must tell them that if they could get no pleasure out of the sight of a Warwickshire meadow, or the hedgerows and little waving hills of Essex, or the flat fields and limestone banks of Oxfordshire and Berkshire, he doubted their capacity for really seeing the huge Swiss mountain and valley scenery, or the flank of the Appennine, or the fairyland of Garda Lake, or the terror of the Thrasymene. In short, what modern landscape visitors usually failed to see was a certain something called “character,” which did not depend upon bigness or roughness or richness, but which meant the expression of a human interest, the telling of a tale of life and interest, the touching of the imagination through the eye. He promised to any one who went with open eyes some month or two hence into any unspoiled countryside that they would find almost every field’s end a paradise, that would cry out to them, in a voice not to be resisted, “Love the earth which you dwell upon and the soil which nourishes you.” But even here, in the hedgerows, the roads and lanes, and other features, the aspect of the place was largely influenced by the work of man. They were, in fact, brought to that transition between the works of nature and art which, when they were happily harmonised, produced the greatest pleasure the eye could have, and appealed most directly to the imagination. If our forefathers lacked the romance of the great walled towns of the Continent, they had as a compensation abundance of ancient villages, with their small but beautiful churches, full of individuality and character, and their generously-built manor-houses and home-steads, which between them all once made an English countryside a special treasure not to be seen anywhere else. Grievous as had been the injury to this treasure-store, and much as we had been robbed of it by our own folly and blindness, there was still enough of it left to teach and delight us. He did not wish them to suppose that he was an advocate of the tumble-down picturesque, for he advised them to keep their village houses weather-tight, trim and useful; and, when they must, build others beside them. But why when they built these should they make them specimens of the worst buildings in the worst suburbs of a modern town? Even in the passing day, if they built them solidly and unpretentiously, using good materials natural to their own countryside, and if they did not stint the tenant of the due elbow-room and garden, it was little likely

that they would have done any offence to the beauty of the countryside or the older houses in it. Indeed, he had hope that it would be from such necessary unpretentious buildings that the new and genuine architecture would spring rather than from their experiments in conscious style more or less ambitious, or those of which the immortal Dickens had given them the never-to-be-forgotten adjective “architectooralooral.” The manner in which their buildings, and especially their houses were built was really the foundation of art, and if they could not build fit and beautiful, not necessarily highly decorated, houses, they could not have art at all in their days. Neither could any work of art—not even the greatest work of art, a beautiful woman—look well in a bad house. That being the case, and their modern houses being undeniably, and even, it would seem, wilfully bad for the most part, he begged of them to take care of their old buildings which were good. Touching again upon the non-use of the eyesight, Mr. Morris drew attention to the awakening of a taste for Mediæval art about the beginning of the century, and the subsequent work of eminent architects in the direction of producing new buildings and the restoration of old ones. Unhappily, he said, they never brought their quasi-knowledge to the test of the eyesight, and the result had been that they had most seriously injured all the great cathedrals of England and almost destroyed some, while of the parish churches it was only here and there we came across one which had only to contend against neglect and the churchwardenism of the last two centuries, and had not had added to the conspiracy against its life the well-meant but disastrous attacks of the restorers. He appealed to his hearers with some hope as intelligent and in this case unprejudiced observers, to help to put an end to this folly of restoration, and he felt sure that the guardians of old buildings might safely leave the question of restoring them to what they had never been to a period when we had at last conquered a genuine style of architecture of our own, and let that age settle the question. Meanwhile, to guard their ancient buildings against brutal destruction and egotistical falsification seemed to him to be one of the prime duties of those who were trying to make people use their eyes, for if people could not see these they could see nothing, and they should acknowledge their defect, and leave the dealing with such works to those who had not the defect.

To the art students he wished to say particularly that unless they were acting in pure error, they had, in establishing and fostering a school of art, accepted the position that it was desirable that people should be taught to use their eyes, and that when they had learned to do so in ever so little a degree the natural result must be an irrepressible desire to create works of art. He wished to dwell upon the words “an irrepressible desire to create,” for he always had, and always should when he had the opportunity, warn young people against looking on the practice of the arts as a mere profession, a career to be chosen for the earning of livelihood. He was often consulted on this point, and his answer was always the same—“If you are quite sure that you have got in you the irrepressible desire, you need no test of capacity to begin with; you will yourself know that you have in you some power of creation. In that case, do not hesitate, but throw yourself into it, for better or for worse, and take what will come. But if you do not feel you have the capacity or desire, then by all means, if you can, study art as a recreation or a piece of education, but do not pledge yourself to live by it; for if you do you will be a burden to art, and will, if you have the insight which a serious person ought to have, feel yourself to be in a false and ignominious position.” This warning was more necessary than ever, he thought, because most men who had any character or strength of will could by concentration and diligence learn the practice of a profession which they were not really fit for; and this very commonly happened in the arts, and produced men who, as far as the arts were concerned, were mere mechanical pretenders, though not necessarily so wilfully. Therefore he advised them to make themselves sure that they had in them the essentials of an artist before they studied art as a handicraft by which to earn their bread. But if they were able to do this, and became genuine handicraftsmen, he congratulated them on their position, whatever else might happen to them, for they then belonged to the only group of people in civilisation who were really happy, persons whose necessary daily work was inseparable from their greatest pleasure. Let them, however, remember that *noblesse oblige*; such happy people as they were could not put up with the follies and dishonesties which they forgave in less fortunate people—bishops and prime ministers, and generals, landowners, great capitalists, and the like. They must be absolutely faithful to their art, and severe judges of their own work. It was clear to him that they had amongst them those who were using their eyes well in the direction of that sympathy with characteristic landscape which he had spoken of before. There was already much; a whole school could be founded on such observation and sympathy, and such a school might have quite important results in teaching the general public to see. He dare say they were being told that they were getting mannered, and he asked them

to attend to that warning, though it might, in some people's mouths, mean nothing except that they had no eyes for the ornamental side of art. The corrective to over much manner was, first, diligent study of nature; and, secondly, intelligent study of the work of the ages of art. The third corrective was infallible if they had it—imagination. If they had not got it he recommended them not to pretend to it; they had better give up art altogether. Hardness must be guarded against, but he would remind them that a design might be very clear and precise without being hard. The hardness came, he thought, from using ugly lines, wiry or edgy; or from overshadowing, not from precision. A word as to colour. It was clearly impossible to teach colour by words, though it could be partially taught in a workshop. They should be rather restrained than over-luxurious in colour, or the eye would be wearied. They should not attempt over refinements in colour, but be frank and simple. Above all, they should not attempt iridescent blendings of colour, which looked like decomposition. To those who were designing figure work he would say, "Do not spare yourselves in drawing from the living model, draped as well as undraped; in fact, draw drapery continually, for remember that the beauty of your design must largely depend on the design of the drapery." He would end by saying that he, an old man now, had been much encouraged with what he had seen of the enthusiasm and aspirations on the right road of the Birmingham School of Art. He begged them to go on encouraging the last generation, so that the future generation might need no encouragement, save that which they would obtain from their own work—the pleasure of creating beautiful things, which was the greatest pleasure in the world.

Alderman Kenrick proposed a vote of thanks to Mr. Morris for his address.

Mr. J. T. Bunce seconded the resolution.

Mr. Morris, in responding, bore testimony to the change for the better which had taken place in the school. There was no doubt many of them had got their heads turned in the right direction. In addition to the work of Mr. Taylor, the students had enjoyed, in his opinion, a great advantage in being able to see the transcendent merits of the works of his dear friend and their own citizen, Edward Burne-Jones. Some people said they were wrong in following him, but he reminded them that the most original men began by following somebody else. He therefore bade them not to be discouraged at being told that they had done wrong, provided they did not content themselves with this, but endeavoured to show what they had got in themselves.

PROPOSED MONUMENTAL CHAPEL AT WESTMINSTER.

THE following letters have passed between Mr. Yates Thompson and the First Commissioner of Works:—

26A Bryanston Square, W.: Feb. 16, 1894.

My dear Lefevre,—In common with all who regard Westminster Abbey with interest and veneration, I have been greatly impressed of late years with the increasing difficulty of finding space for the continuation of the unrivalled series of monuments of those whose memory the country desires to honour. It is admitted on all hands that there is no longer any space in the existing building for even the most modest memorial without interfering with the architectural beauties of the structure, or unless, as in the recent monuments to Henry Fawcett and James Russell Lowell, they be placed where the sculpture is almost invisible and the inscription quite illegible. This, indeed, was the conclusion of the Royal Commission on the Abbey which reported in 1891, and which was unanimously of opinion that an addition ought to be made to it, although they differed as to how this best should be effected.

It is probably owing to this difference of opinion that neither the late nor the present Government have seen their way to proposing any definite scheme to Parliament on the subject.

Under these circumstances it has occurred to me that it may be open to a private individual to make an offer which may lead to satisfactory action in the matter.

I have carefully considered the plan which Mr. Pearson laid before the Royal Commission for the erection of a monumental chapel connected with the Abbey by a cloister leading from Poets' Corner round the north-east side of the chapter-house to the new building which would occupy the site of some of the houses which at present disfigure Old Palace Yard, and Mr. Pearson has permitted me to see the designs for the building which he laid before the Commission, but which were not published with their report. The full design involves the erection of a considerable building, but Mr. Pearson pointed out to the Commissioners that it would not be necessary to erect the whole of it immediately, but that all requirements for years to come would be met by the erection of the two smaller aisles of the main building. One of the chief merits of the scheme is that it will involve the removal of the houses in Poets' Corner and in Old Palace Yard up to but exclusive of

No. 5, which have been condemned by the Royal Commission as positively dangerous to the Abbey from the risk of fire, and the demolition of which would open out a view of the beautiful chapter-house, with which Mr. Pearson's proposed new chapel would make an effective and harmonious group.

Mr. Pearson has been so good as to make for me a rough estimate, which he believes would not be exceeded, of the cost of erecting the first part of this building. Including the two smaller aisles and the connecting cloister, and including also the expense of the railings, paving, architect's commissions, &c., he brings out a total somewhat under 38,000/. This, however, does not include the cost of the site and the removal of the houses in Old Palace Yard and Poets' Corner. I understand from you that the Ecclesiastical Commissioners, who are the ground landlords of these houses, the leases of which are about to fall in, are prepared, in consideration of the danger from the houses of fire to the Abbey and of their condemnation by the Royal Commission, to accept something less than half the actual value of their interest in the property.

Apart from the provision of the site, I am willing, as a contribution to so national an object, to give the sum which may be necessary for the erection of the building itself and its accessories not exceeding the amount of 38,000/. I shall be prepared to hand over 20,000/. as soon as the site shall be made available for building, and the balance when the structure is half finished, and I will leave this offer open for twelve months from the present time.

If this offer be accepted I should stipulate:—

1. That the new chapel form part of the Abbey.
2. That the additional space obtained be appropriated for the erection of future monuments only.
3. That arrangements be made for the maintenance of the new building, and that no fees be charged for the erection of monuments in it.
4. That it be open to monuments of the class to which the Abbey has of recent years been appropriated, viz., the memorials of those men and women who may be adjudged to have rendered distinguished service in literature, science and politics, or philanthropy to the British Empire or the Anglo-Saxon race.
5. That the name of the donor be legibly inscribed on stone somewhere near and inside of the main entrance.—I am very truly yours,

H. YATES THOMPSON.

The Right Hon. G. Shaw-Lefevre, M.P., First Commissioner of Works.

H.M. Office of Works, S.W.:

February 24.

My dear Thompson,—I have had very great pleasure in submitting to the Government your offer to undertake the whole cost of the erection of a monumental chapel, or rather so much of it as it would be at present desirable to erect, in connection with Westminster Abbey, upon the site of some of the houses in Old Palace Yard, provided that the site be cleared for the purpose.

I desire on the part of the Government to thank you for this most generous offer; and I am certain that you will not think them wanting in appreciation of your great liberality if I explain the circumstances which impose upon them the necessity of very full consideration in dealing with the matter.

I need not remind you that the Royal Commission of 1891, while unanimous as to the expediency of making an addition to the Abbey for the purpose of continuing the roll of monuments of those whom the nation desires to honour, were evenly divided as to the best mode of effecting this. One-half of them, including my predecessor at the Office of Works, Mr. Plunket, were in favour of erecting a chapel by the cloisters, on the site where the refectory formerly stood; and the other half recommended the site in Old Palace Yard, to which your offer is confined.

As you are aware, I have for a long time past been favourable to the latter scheme, and should be very glad to see it carried out. But in a matter involving an addition to a building held in such reverence as the Abbey, and where there is such difference of opinion, I could not take upon myself the responsibility of advising the Government and the Dean and Chapter of Westminster as to the best mode of effecting the object in view. The question must be referred to the highest authorities who are competent to form an opinion upon it.

The Government consider that, before undertaking such an inquiry, it will be expedient to remove the houses in Poets' Corner and Old Palace Yard, in accordance with the recommendations of the Royal Commission, who were unanimously of opinion that they are not only a grave disfigurement to the Abbey, but a cause of danger to it from fire. When these are removed, it will be more possible to form a judgment as to the effect of an addition to the Abbey in this direction on the plans of Mr. Pearson.

I had already, before the receipt of your letter, been in communication with the Ecclesiastical Commissioners, who are the ground landlords of the houses in question, with a view to carrying out the recommendation of the Royal Commission.

The Government, with the co-operation of the Ecclesiastical Commissioners, intend to lay before Parliament in the ensuing Session a scheme for the removal of these houses. Until this is effected I think you will agree that it will be better to defer giving a definite answer to your proposal, for which I must again express most cordial thanks.—Yours very truly,

G. SHAW-LEFEVRE.

Mr. H. Yates Thompson.

ARTISTS' VOLUNTEERS.

ON Wednesday in last week Sir Frederick Leighton, hon. colonel, distributed the prizes to the 20th Middlesex Rifle Volunteers at the headquarters, Duke's Road, Euston Road. Colonel R. W. Edis, F.S.A., the commanding officer, in presenting the annual report, said that the corps still upheld its high state of efficiency, and now numbered forty-eight over its proper establishment. Sir Frederick Leighton, before distributing the prizes, commented upon the great progress made by the corps during the thirteen or fourteen years which had elapsed since he reluctantly gave up the active command of it. During the years in which he commanded it one idea was always dominant with him, and that was to prevent their falling into an attitude of indifference or dilettanteism in regard to the great public duty that they had undertaken to fulfil, and to keep before them the grave responsibility they had assumed in entering the ranks of the Volunteer force. Recent affairs in South Africa had shown what Volunteers were capable of doing, and the lesson taught by what had happened in that country, he was convinced, would not be lost upon them. Colonel Gascoigne, of the Scots Guards, the brigadier of the South London Volunteer Brigade, expressed his great appreciation of the work of the battalion, which, he was proud to think, formed part of the brigade he had the honour to command. The distribution of prizes was followed by an assault-at-arms.

THE KIRKCALDY HALL COMPETITION.

WE have been asked to publish the following correspondence between the Town Clerk of Kirkcaldy and the hon. Secretary of the Edinburgh Architectural Association:—

The Secretary writes on December 23, 1893:—As instructed by the Council of the Edinburgh Architectural Association, I beg to enclose representation from them with regard to proposed Beveridge Hall, &c., competition, and to request that you will be good enough to submit it to the committee as early as convenient.

(Enclosure.)

Princes Street, Edinburgh: Dec. 23, 1893.

A copy of the conditions laid down by the Provost, Magistrates and Town Council of Kirkcaldy, for the guidance of architects who may feel disposed to compete for the erection of the Beveridge Public Hall, Free Library, and Adam Smith Memorial Hall has been laid before the professional practice committee of the Edinburgh Architectural Association, and with a request to examine the document and report to the Council of the Association thereon.

This they have done, and I am desired in the name of the Council, who have carefully considered the report, to draw attention to three points in these conditions which, in their opinion, are highly objectionable, and which they trust the Provost, Magistrates and Town Council may see their way to amend.

These points are—(1) The amount of commission offered; (2) the power reserved to retain the three sets of designs for which premiums are offered, without employing the author of the first premiated set to carry out the work; (3) the absence of any provision for the engagement of a professional assessor.

As regards—(1) The amount of commission offered being 4 per cent. is one-fifth less than the commission recognised by the Royal Institute of British Architects and the other architectural associations in the United Kingdom, and the result will be that architects of standing who conform to the rules of the profession will be deferred from competing.

(2) The absence of guarantee that the architect of the first premiated set of designs will be employed in the erection of the buildings is quite sufficient to prevent any competent practising architect from competing, as there is no inducement to him to spend time in preparing designs which may cost him the amount of the premium to prepare—possibly more—and so leave him without any legitimate reward for his labour.

The second and third sets should be returned to their authors, as no architect with any respect for himself would appropriate the work of another competitor. Presumably the premiums are offered as some compensation for the trouble the unsuccessful competitors have been put to, and not as representing the value of the designs. This being so, there can be no objections to the said drawings being returned to the authors.

(3) The absence of any provision for the engagement of a

professional assessor will inevitably prevent many architects from submitting designs, as it is quite evident that, however able and well-intentioned a lay committee of judges may be, there are many points both technical and artistic which can only be fully appreciated by an architect who has made the study of planning and designing the business of his life.

It is observed that the total cost, including three halls, library, subsidiary buildings, boundary walls, architect's and measurer's fees, and clerk of works' salary, is not to exceed the sum of 12,000*l.* sterling. The Council of the Association had not an opportunity of examining the extent and situation of the proposed site, but it occurs to them that the sum of 12,000*l.* will prove very insufficient for all that is stipulated for, especially as the buildings are to be of a monumental character. They have thought it right, therefore, to refer to this, so that your committee may not afterwards be disappointed.

On February 9, 1894, the Secretary again writes:—I am directed to remind you that I have not yet been favoured with a reply to my letter of December 23 last regarding the above.

In reply the Town Clerk says:—I have yours of yesterday and also received yours of December 23. The Council have decided to adhere to the conditions of the competition. An architectural adviser, however, will be appointed.

THE RUSKIN MUSEUM, SHEFFIELD.

DURING late years the collections in the Ruskin Museum, Sheffield, have not received many additions, but it is not to be supposed that suitable works are unwelcome. The curator, Mr. William White, writing on the subject, says:—Although it is unfortunately true that Mr. Ruskin's ill-health during recent years has prevented him from continuing to superintend the guild's operations, and there has been, therefore, a period of partial interregnum until such time as they might be again actively renewed, the trustees of the guild, having been authorised by him to act for him, it should at least be known that the guild is in existence—one of its trustees being Mr. Alderman Baker, who has twice occupied the mayoral chair of Birmingham—and continues to effect the scheme of the museum as fully as its unaided funds now admit of. I may state that Mr. Ruskin has expressed in writing very clearly what he intended to be done in furtherance of his project in connection with the museum, which he by no means proposed to limit in character, in the manner of a private collection: it was to be thoroughly educational in the highest sense of the word.

During the last few years, since the Corporation of Sheffield has liberally undertaken the external maintenance of the museum, more has been possible than formerly, and several drawings of the mosaics of St. Mark's, at Venice, have quite recently been added to the collection, in addition to very many other drawings and objects acquired by gift or purchase. Among the latter may be mentioned two drawings by Signor Alessandri, one of the staff of exceptionally able artists whom Mr. Ruskin trained so highly for the production of such work, namely, a full-size copy of the head of St. Ursula in Carpaccio's famous picture in Venice of *St. Ursula's Dream*, one of the series of paintings about which Mr. Ruskin has written so fully, and the *Stoning of St. Stephen*, after Tintoretto. The latter, a masterly reproduction in transparent water-colour, of such quality as can nowhere else be seen, has only just been procured; and the purchase of other works by this marvellous copyist are still in contemplation, including a further commission that will occupy him for many months to come. In fact, since the alteration in the management in the year 1889, when I was appointed to the charge of the museum, several hundred drawings which had never been seen by the public previously have been delivered, and carefully framed for exhibition here. Some of these were forwarded from Brantwood, London, and elsewhere, the majority having been kept in store or on loan until they could be duly dealt with at the museum; while many other works are still awaiting similar treatment. Several objects have also been lent during this term to the Birmingham School of Art, and also for exhibition at Huddersfield and Liverpool. At the present time, it may be of interest to know, a somewhat voluminous handbook to the art portion of the collection, upon which I have been occupied for a considerable period, and which will form an introduction to the art-teaching of Mr. Ruskin, as illustrated by the examples in the museum gallery, is in the press, and will shortly be issued by Mr. Ruskin's publisher.

Thus it will be seen that the operations of the museum continue to progress in the manner Mr. Ruskin so heartily desired, and that his programme of future work is being adhered to persistently, with the greatest regard to the scope which he has very specifically defined, nothing being admitted of any kind but what he would undoubtedly most thoroughly approve. To save any unnecessary correspondence, it may, therefore, be well

to state that ordinary offers of objects cannot for a moment be entertained by the trustees.

In conclusion, I should not like to omit saying that I most heartily commend all kindred operations that are calculated to carry out the object Mr. Ruskin has in view. Yet I cannot but think that while the agency of the guild and museum which Mr. Ruskin specially established is in active existence, there is no occasion for any independent or subsidiary schemes carried out in a disjointed and unauthorised manner in the name of Mr. Ruskin, and in repudiation of this museum, whose very existence and object is the systematic production and exhibition of works in illustration of what he has so beautifully described and explained. Until now, since Mr. Ruskin has been unable to take an active part in the furtherance of his projected scheme, no fresh appeal has ever been made, either by the trustees of the guild or myself, for any donation whatever for these purposes. But I think it should be known, as apparently it is not, that any contributions, either in the form of an annual subscription or donation or bequest, towards the great purposes which Mr. Ruskin has so freely devoted his life to advancing, will be gladly received by either the trustees or myself on their behalf.

INSTITUTION OF CIVIL ENGINEERS.

At the meeting of this Institution, Mr. Alfred Giles, president, in the chair, a paper was read on "Forging by Hydraulic Pressure," by Mr. R. H. Tweddell, M.Inst.C.E.

The paper commenced by a brief history of the development of the hydraulic forging-press since the year 1846, when the late Sir Charles Fox proposed the attachment of different tools for the working of hot or cold iron to the tables of the Bramah press. The author then formulated the following conditions as necessary to be fulfilled to insure success in hydraulic forging: first, the press must be so proportioned as to insure the utmost rigidity, any movement of the main columns of course interfering with the correctness of the work; secondly, the crane-power must be not only ample but so arranged that weights reaching to 100 tons could be manipulated by unskilled labourers; thirdly, the details of the construction of such parts as the valves and pumping arrangements must be as perfect as possible. These conditions were discussed seriatim, and the author indicated the means by which they were met in the various types of forging-presses now made. Proceeding to particular makes of press the paper gave descriptions of all those at present manufactured in England. This part of the paper concluded with a reference to the 22-cwt. steel ingot exhibited in the 1851 Exhibition by a Sheffield firm, the size of which was then considered quite exceptional; and by quoting Fairbairn's opinion of the value of the steam-hammer in building up large masses of iron for the manufacture of large guns and marine-engine shafts.

The second part of the paper was devoted to a comparison between the hydraulic forging-press and the steam-hammer. Starting with the axiom that noise and waste of energy were convertible terms, the author mentioned the points in which there could be no difference of opinion as to the superiority of the press. Its power was practically all exerted upon the forging and not dissipated in shocks to the framing and foundations; it also occupied much less head-room than a hammer, and consequently travelling-cranes could be used, passing, if necessary, over the press. Further, not only could more work be turned out by a press than by a steam-hammer in a given time, but it could work through a much greater range, for while the effects of a "blow" shortened the life of any of the dies or tools used, it rendered impracticable the employment of numerous dies and moulds which were satisfactory under pressure. The art of forging large masses had made distinct advances since the introduction of hydraulic pressure; for it was formerly impracticable to forge the hollow marine shafts at present used, or to draw out gun-tubes or hoops on the mandril.

It was extremely difficult to draw the line where the tools described ceased to be forging-presses and became stamping- and welding-machines. Here, there was more room for discussion as to the merits of forging-press *v.* steam-hammer, because many interesting questions arose as to the relative effect of a blow or a steady pressure when, for instance, stamping the ironwork used in wheel-making. The author had preferred to confine himself to the hydraulic forging-press proper and to eliminate the mechanical treatment of metals by forging or pressing as a whole. Much thought had been expended in trying to calculate the size of hydraulic press that would be equal to a steam-hammer exerting a given force of blow, but in the opinion of the author the question was not worth pursuing, because until the amount of work done on the forging was equal and done in the same space of time no satisfactory comparison could be made. Owing to the action of the hydraulic press being constantly progressive the tool continued to free its way into the ingot until its resistance to alteration of form was equal to the pressure on the ram, or the

latter was removed. In this it differed entirely from the action of a hammer which, having delivered one blow, did no more work until the following one. This constituted the essential difference between the two machines. The effect of the hammer was momentary, and there was not time for the pressure it gave to penetrate the metal, much less to alter its form to any extent at one blow, but in the hydraulic press the same rate of working per hour could be maintained, while the material was allowed every opportunity to flow in the required direction without injury. The effect of hydraulic pressure on forgings was to increase their homogeneity. The blow of a steam-hammer was given with least effect when it was most required, that was, it could not get its full stroke until the forging was reduced in size, whereas the press gave its full power at any point in its stroke.

The paper was accompanied by an appendix giving a detailed account of each of the forms of forging-press alluded to in the text; by a note by Mr. Charles Davy, of Sheffield, comparing a press and a hammer doing nearly equivalent work; and by an account of some experiments by Mr. Coleman Sellers, of Philadelphia, on the number of hammer-blows and the amount of hydraulic pressure required to deform similar test-pieces to the same extent.

GENERAL.

Mr. W. E. Ward, of Birmingham, has given his report on the designs submitted for the proposed workhouse buildings at Shaw Heath, Stockport. The first prize of 300*l.* is awarded to Messrs. Booth & Chadwick, Oxford Street, Manchester; the second of 100*l.* to Messrs. Mangnall & Littlewoods, Brown Street, Manchester; and the third of 50*l.* to Messrs. J. Morris & Son, Bolton.

The Scottish Society of Water-Colour Painters have, out of sixteen candidates, elected the following artists as members:—Messrs. W. F. Brown, Frederick G. Richardson, A. C. Holms and Walter M'Adam. At the same meeting Messrs. John Smart, Wellwood Rattray and Duncan Mackellar were appointed hangers for the next exhibition.

Mr. David Burnett, of 14 Nicholas Lane, E.C., has been elected a director of the British Land Company, Limited.

Mr. James A. Cook will read a paper entitled "Three Years' Architectural Life in America" at the meeting of the Liverpool Architectural Society, on Monday, the 5th inst.

The Surveyors' Institution will hold a meeting on Monday, the 5th inst., when a paper will be read by Mr. Howard Martin on "The Report of the Local Government and Taxation Committee of the London County Council on the Subject of the Rating of Ground Values."

Miss Marion Brocklehurst, of the Bagstones, near Leek, has offered to build a museum in the public park for the town of Macclesfield, at a cost of 500*l.*, and to endow it with 50*l.* a year for expenses and 50*l.* a year for a lodge porter.

The Bradford Arcadian Art Club opened their ninth annual exhibition by a private view on Saturday last.

Lord Downshire has presented the committee of the Newry Intermediate School with a site for a new school, for 900 years, at the nominal sum of one penny per annum. The erection of the school is therefore no longer problematical.

An International Exhibition will be opened at Lyons on April 26, and will be closed on November 1.

The Building Act Committee of the County Council propose that Mr. W. H. Stevens should be appointed, temporarily, district surveyor for the district of St. Pancras North and the detached portion of Clerkenwell.

An Art Gallery is to be provided for Reading, at the cost of the Palmer family. The late Mr. W. J. Palmer, in his will, left pictures valued at 1,000*l.* to form the nucleus of a collection.

Mr. Harold Baker read a paper on "Notes in the Avon Valley from Pershore to Tewkesbury" at the meeting of the Archaeological Section of the Midland Institute last evening. Mr. Howard S. Pearson presided over a large attendance. The lecturer described the scenery on the Avon between Pershore and Tewkesbury, and in an interesting manner sketched the histories of the old abbeys in those times, and also of the ancient village churches *en route*.

Professor Powel, of University College, Cardiff, at the meeting of the Cardiff Cymmrodorion, gave an address on the "Castles of Wales." He proved that there were castles in Wales prior to the Norman period, in which the princes lived, but that they were different in construction to the castles the ruins of which could be seen at the present time. He showed also that these latter ones were not Welsh, but built and kept at a great cost to keep the Welsh nation under control.

Sir George Hayter Chubb has accepted the invitation to serve on the joint committee formed by the Lord Mayor and the London Chamber of Commerce in connection with the forthcoming Antwerp Exhibition.

The Architect.

THE WEEK.

AMONG the necessities which are incumbent on the wealthy in our time is the possession of a castle or house, or at least a shooting-lodge (which elsewhere would be considered a large house), in the North of Scotland. In the erection of buildings of that class there was no architect who was more sought after than ANDREW HEITON, of Perth, who died on Saturday last. If he were less able he would still be successful by his manner. He was so frank, genial and good-humoured, so manly and unaffected, it is no wonder so many gentlemen confided their interests to his charge. After a few minutes' conversation with him it was felt that he would be manly and honourable in all transactions. Shrewd Englishmen who made fun of the solemn but absurd posing of the crowd of applicants for a commission, treated ANDREW HEITON as a friend, and were zealous to advance his interests. The large number of his country houses is the best evidence of the respect in which he was held by the most fastidious class of clients. His success did not spoil him, nor make him supercilious and vain. Extensive as was his acquaintance with northern archæology, he was never pedantic, and it must be said that as an architect he could not be charged with undervaluing the buildings of his contemporaries. It is thirty years since Mr. HEITON succeeded his father as city architect in Perth, and he had no ambition to seek his fortune in larger places. His reputation soon extended beyond its boundaries. The HEITONS were an old Border family, and ANDREW HEITON inherited the peel tower of Darnick, between Abbotsford and Melrose, which was filled with "a fouth o' auld nick-nackets, rusty airn caps and jinglin jackets," as well as with other treasures of a peaceful sort. He prized the old tower above any of the buildings he designed, and he was never happier than when he could hold forth with earnestness and humour about its contents with a few friends. It was to Darnick he returned to die. In his business he is succeeded by his nephew, Mr. A. HEITON GRANGER.

No less than eighty-six sets of designs were sent in for the Darlington Municipal Buildings. The Town Council asked Mr. MACVICAR ANDERSON to act as assessor. By his award the design marked "Ad Rem" was placed first, "Practical" second and "Santa Claus" third. Accordingly Messrs. CLARK & MOSCROP, of Darlington, have obtained the prize of 150*l.*; Mr. H. A. CHEERS, of Twickenham, jointly with Messrs. JAMES ASPINALL & JOSEPH SMITH, of Blackburn, 100*l.*; and Mr. G. G. HOSKINS, of Darlington, the prize of 50*l.* The estimated cost of carrying out the successful design is 27,652*l.* The assessor, in his report, wrote:—"The selected designs display considerable ability. The plan of 'Ad Rem,' in particular, I regard as exceptionally compact and convenient, both as regards the municipal buildings and the public hall, while the wide space on the west side of the building, and the purpose to which it is allocated, appear to me excellent features. The architectural treatment both of the exterior and interior deserve high commendation. So far, indeed, as ability is concerned, no doubt or hesitation need be felt in entrusting the execution of the project to the author of this admirable design."

ON Wednesday the proposal to establish a school of architecture and applied art came before the Liverpool City Council. The committee had recommended that the sum of 1,000*l.* a year for an experimental period of five years should be contributed by the Council. The Town Clerk said that the Council could not enter into an engagement of the kind, as it would be anticipating income, and he advised that the proposal should be amended in order to correspond with the obligations of the Council, a course that was adopted. There was very little opposition. One member said it would be better to expend the money on libraries and other institutions for the working classes, for those people who were desirous to bring up their sons as architects had no right to come to the Council to provide the ways and means. But as there was no division it may be

considered that the scheme was adopted with unanimity. At the same meeting it was decided that designs for the new baths at St. George's Pierhead should be obtained by competition, although arrangements had been already made for the preparation of plans by the city surveyor. The outlay will be about 50,000*l.*

THE City Square in Leeds could be converted into an attractive area, but probably there is apprehension that in a city where there are so many mean houses it is not wise to rise beyond the average dead level in any place. The Council having decided to make alterations in City Square, the local architects, with the support of some amateurs, have sent a remonstrance about the proposal. In a memorial they say:—"We view with regret the decision of the City Council on the 7th ult. to commence the laying-out of the City Square by the erection of a public latrine and the removal of the PEEL statue to the centre of the square. We think that to commence any work in connection with the laying out of the Square—which has opened out artistic possibilities the Council have seldom had, and which, with judgment, might be made an object of beauty in the city—before any definite scheme or plan has been considered, would, in our opinion, ultimately lead to failure. We therefore suggest, having regard to the importance of the work, that the Council should place the matter in the hands of a man of acknowledged artistic talent, or obtain a variety of ideas by instituting a public competition." On Wednesday a deputation of the memorialists appeared at the meeting of the Leeds County Council. Mr. BULMER explained the proposals. Subsequently it was proposed to advertise for plans for laying out the Square and to award a premium of 20*l.* for the best. It was considered, however, that it would be premature to decide on any course of action until the new Post Office was completed.

WE lately referred to a lecture which Mr. R. J. BENNETT delivered in Glasgow descriptive of the builders' exchanges which are now to be found in the principal cities of the United States, and are recognised as an indispensable convenience. It is now proposed to establish a similar institution in Glasgow, where all who have to co-operate, directly or indirectly, in the erection of buildings can congregate for the promotion of business. After hearing Mr. BENNETT explain once more the advantages of exchanges, it was arranged to form a committee composed of representatives of the local architects, measurers, masons, brickmakers, wrights, plasterers, plumbers, painters, slaters, cabinet-makers, glass merchants, ironmongers, bellhangers and gasfitters, marble-cutters and tile-layers, to undertake the preliminary arrangements for founding a builders' exchange in Glasgow.

THE admiration of COLERIDGE and CHARLES LAMB has not made the works of DRAYTON familiar to modern readers; but archæologists can find many things of great interest in his pages. DRAYTON's references to Essex were lately explained in an interesting paper read at the annual meeting of the Essex Archæological Society. It was explained how the poet talked of "Choice Chelmer" coming along, "while Dunmow glided down to Chelmsford." The poet then journeyed to the Blackwater, to which he devoted some lines, and then passed on to the river Colne—"the Colne which lends fair Colchester a name," speaking of its oysters, and, what to us sounded strangely, the "cheese which our fat soil from every quarter sends." The poet also referred to the finding of old coins and weapons at Colchester, and then finished his journey at Harwich. There were one or two points in the poet's Essex song worthy of note; surprise was expressed by the two foresters that the forests of Waltham and Hatfield were not felled, a fate which was befalling so many others. It was a curious thing that those two forests were the only two now remaining in the county. In the songs there was striking evidence of the prosperity of the county at the commencement of the seventeenth century, it being declared that Essex was blessed with "every kind of good that in the isle is found." Essex was not the only county which DRAYTON had traversed, and we recommend his works to provincial essayists who are in want of a subject.

MOSAICS.

A GREAT many excellent musicians, if they possessed power, would make it a penal act to manufacture or to use a piano. They say that, from the construction of the instrument, it is impossible to have that "linked sweetness long drawn out" which is an essential in music. A composer can, it is true, write pieces which will suit the little tapping and vibrating so as to enable a performer to deceive his hearers, but BEETHOVEN himself could not enable a pianist to express the melody that is easy with wind and stringed instruments. For a similar reason mosaic must always remain inferior to painting. However laborious may be the operations, it is impossible to produce a curved line by that medium. There may be an infinitude of infinitesimal lines put together to make a line which at more or less distance will appear to be curved, but after all the result will hold a relation to what an able painter can do by a stroke of his hand that is not unlike a surveyor's triangulation in relation to a bit of picturesque scenery. At one time "Berlin wool pictures" were much admired in English houses. As soon as a little information about the principles of art became common they were scorned, for it was then perceived that the mechanical imitation of a pattern made up of squares was evidence of meekness, patience and industry, rather than ability in drawing or colouring. If we imagine the squares to be filled with a coloured composition instead of woollen thread, we should then have a piece of mosaic. Ages before GIOTTO made his O and HOGARTH drew with his graver a reversed curve on a piece of copper, men felt that without curves there cannot be art, and until men become more approximated to machines than they are at present, the old-fashioned notion must be respected. The right line is not only the shortest distance between two points; it is, too, an excellent symbol of uprightness, equity, justice and countless virtues; in architecture, moreover, it should be supreme, but the painter or the sculptor would not suffer if he were deprived of the power to draw one.

Unfortunately the examples of the painter's art cannot endure, and as instinctively men wish to overcome their conqueror Time in some way, we might suppose that at a very early age pictures made up of coloured minerals came into use. If, however, we believe with SEMPER that mural decoration of all sorts is derived from tapestry, and that the use of pottery on the surface of walls preceded the manufacture of burnt bricks, it is safe to conclude that many kinds of decoration were likely to have preceded the use of mosaic in buildings. According to DE LABORDE, mosaic was received from the ancients by the Middle Ages as a modest sort of pavement; it was made to ascend the walls, and then it invaded all architecture, but that statement is only partially exact. That mosaic was originally applied mainly to floors would appear from the reference in the Book of Esther to the pavement in the palace of AHASUERUS, which was "of red, and blue, and white, and black marble." The legend about the whole of the "Iliad" being represented on the deck of a boat belonging to HIERO OF SYRACUSE suggests that when figure-work was copied mosaic continued to be applied horizontally. The Romans could hardly exist in a house that did not possess a mosaic pavement. When they seized a country they began to lay them down, and mosaic pavements were, it is said, to be seen in tents during campaigns. Why so much importance was given to that class of work is inexplicable. But the affection for mosaic caused the artists to make the pavements more elaborate, and intricate paintings were reproduced without any regard for the law of fitness. In some cases satisfaction was supposed to be offered for the breach of æsthetic laws by introducing bordering made up of representations of the usual *débris* of a dinner.

If considered as the adornment of a pavement, intricate battle-pieces and figures of gods and goddesses were out of place. Archæologists have, however, reason to regret that in spite of its shortcomings mosaic was not utilised more often for the preservation of copies of works by Greek painters. It may be doubted whether the process was ever so employed. Some of the examples derived from Pompeii have been fondly supposed to be taken from renowned paintings, but as the names of the artists whose works were copied are never recorded, it is no

less likely that the mosaic was derived from special designs. Mosaic copies would have enabled all ages to decide about the value of Greek paintings—a question that must be left to conjecture.

In what age mosaics were first applied vertically is unknown. Probably the experiment began with the adornment of columns and pilasters. The effect would be sure to please Roman eyes; but strange to say figure subjects were supposed to be more suitable for floors than for walls. In the second century of our era figures in mosaic were employed to decorate vaulting, and possibly at an earlier period. After Christianity had ceased to be proscribed mosaic decoration assumed a new importance. The work was mechanical, and therefore many of the humbler classes could co-operate in the production of medallions, ornamentation and simple figure pieces. The examples which have survived from the fourth century are not of higher value than the paintings in the catacombs. The rise of Byzantium created a new and more profitable field for the mosaicists, as CONSTANTINE and his successors went beyond the pagan Romans in admiration for the work. The artists must have enjoyed a long period of prosperity.

After continuous application they could hardly fail to evolve some sort of theory about the strength and weakness of their art. The examples at Ravenna and elsewhere reveal that the art was better fitted to represent architectural works—more or less imaginary—richly embroidered vestments and robes, tapestry, utensils, &c. The gloom of some of the buildings has made many of the faces assume a sort of impressiveness, but in the majority of cases they are conventional and lack expression. Let any one compare the treatment of the heads and of the garments of the courtiers in St. Vital, and it will be plain that the mosaicists were glad to labour over the elaboration of the embroidery, because with work of that kind they were not entering into a sort of competition with painters, in which defeat was inevitable, for in mosaic it was as impracticable to express a large expanse of one colour as to form a curve. This difficulty has been admitted by the designers for mosaic who have given attention to the subject. Artists of that class are able to perceive that it is not enough to give a sketch that would serve to be executed in oils. The lines and colouring must be adapted to the less pliant material. TITIAN, who could hardly be considered as qualified for such work, sometimes has been happy, especially when he abandoned his ordinary methods of representation. In his standing figure of St. MARK in the Venetian basilica he gets over the difficulty offered by a chasuble of the fifteenth-century fashion by representing it as hanging very loosely on the figure, in order to have several folds instead of stiffness, and by breaking up the surface as if it were covered by an indefinite pattern. As the head is thrown back on looking upwards, and the Saint has a short and thick beard, the weakness of mosaic contours becomes less manifest. In other compositions TITIAN was less subservient to the conditions of the work, but we must remember that in his day it was believed that a piece of mosaic was most successful when it became a counterfeit presentment of an oil-painting, or, as VASARI believed, of a miniature. Fortunately a different theory is now adopted, which was expressed by THÉOPHILE GAUTIER when, in discussing the merits of the early and later mosaics in St. Mark's, he said:—"In mosaic as well as in glass-painting the imitation of nature should be avoided. A mosaic may be called an opaque glass-painting, and the latter a transparent mosaic; the palette of the mosaicist is made up of stones, that of the glass-painter of jewels. Neither of them should seek after reality."

In the great work which Mr. W. B. RICHMOND has commenced at St. Paul's, it is satisfactory to find that he has resolutely avoided the treatment which would be most satisfactory to the majority of sightseers. But as he has succeeded in educating Messrs. POWELL and the men who were entrusted with the realisation of his designs, it is to be hoped that he will be no less fortunate with the English and American pleasure-seekers who will visit St. Paul's in order to criticise the new decoration. For in preparing his drawings Mr. RICHMOND says:—"I had determined to set my face against the modern system of pictorial mosaic; to endeavour as far as in me lay to develop instead the severe style of the earlier mosaic

workers that Italy produced from the sixth to the ninth century, and upon this severe foundation to build up a system of decoration which should belong to the wider, though shallower, perceptions of the modern mind." It may be objected that the style that was suitable a thousand years ago is out of place in an eighteenth-century building. There is no doubt that WREN would have considered the grandiose style of LEBRUN as more in keeping with his building than the severities of the early mosaic workers. Indeed, it is fortunate that WREN was not able to decorate his cathedral, for his powers in that way were not extraordinary. But it does not follow that a severe style of mosaic necessarily means the production of figures which offend against anatomy and physiology. There is no reason why the theological virtues should become more inspiring if they appear as awkward women enveloped in big blankets. Severity is a relative term, and when applied to the new mosaics at St. Paul's it may be taken as suggesting that they are not in the style which prevails in the pictures that are most admired in the summer exhibitions of the Royal Academy.

Let us take colour in the first place. GOETHE, who was industrious in collecting information about "Farbenlehre" and "Farbenbehandlung," calculated that the Italian mosaicists of his day employed variations of colour that are startling from their number. Mr. RICHMOND on the contrary considered that his end would be attained by the use of thirty varieties, and after gaining experience he found that "four whites, three reds, two blues, three greens, three browns, two cool and two warm greys, a strong black and three flesh colours" formed an adequate stock. The limitation in tints insures the desirable non-pictorial quality for a mosaic. Few as were the colours, Mr. RICHMOND acknowledges that he did not foresee their power for disappointment. He had made his outlines rather thin and used brown for them instead of black. The result deserves to be added to those contrasts recorded by CHEVREUIL and OWEN JONES :—

Pure white I found to spread excessively, dark blue to tell as black, amber colour to become quite unreasonably dark, pale cool pinks even greyed very much at a distance and required to be outlined with a strong red to give their value. Both warm and cool greys can be altered as to their appearance very markedly by the colour of the outline by which they are surrounded. Outlined with blue, the whole mass by which the outline is surrounded appears to be influenced in a very distinct manner by its environment; so also does the same method hold good when the outline is red. Blue round white, instead of warming the white, turns it into a faint and rather dead blue colour, whereas, outlined with red, the white appears pink. Strong yellow-greens tell extremely well, but they must be outlined with a thick line of red or burnt sienna-brown to give them their proper value. White lines in light green are very disastrous. Either a toned grey or dull yellow breaks the green best. A black outline to blue is only necessary to divide the blue from gold, or to draw the folds of the drapery where the lights of the blue are brightened with gold; the black outlining seems to preserve the integrity of the blue, whereas a red outline turns the blue into purple. A dark outline of blue or green gives a very mysterious effect, but in that case the blue must be a very clear one and of a middle tint quality, otherwise the blue will tend to make the green appear muddy.

It is creditable to an artist when he puts his own work under the microscope and does not hesitate to face the shortcomings. Mr. RICHMOND increased when necessary the width of his outlines, using tesserae of a better black, introduced white lines among the light colours, substituted dull for bright gold, and so on. The effect of the change was satisfactory. Silver was a disappointment; burnished gold was avoided in the background, and the artist claims a success for what he used. In one of the lately-executed mosaics in Paris the gold background had to be painted over with white in parts, in order to diminish the vulgar glare. Mr. RICHMOND ascribes the failure in similar cases to the tesserae being fixed too closely and to the use of only one quality of gold. "One need never be afraid," he says, "of letting the ground show the sixteenth or even a quarter of an inch around each cube." The belief that a mosaic should correspond with an oil-painting in treatment is established among workmen, and their ambition is to form a surface that will not reveal the number of tesserae employed, and to accomplish that end they try to make the joints almost invisible. Mr. RICHMOND tells us of the difficulty he found in persuading his men that "the worst mosaic is most like a picture, and the best mosaic has all the structural qualities belonging to architecture; the one

entirely out of place in a building, while the other seems to grow naturally out of architectural forms."

The concealment of the joints of the tesserae was not the only defect which Mr. RICHMOND has endeavoured to amend. He has gone back to the old method of fixing tesserae directly on the wall instead of laying them down on paper, which is the usual way. Whether the reform can become general may be doubted, for a mosaicist has to suit the convenience of others, and on that account he must endeavour to do as much of his work as he can in his own workshops. In St. Paul's Cathedral all things were arranged to give Mr. RICHMOND facilities for his experiments, but in most buildings supremacy cannot be yielded to the decorator, or, in fact, to anyone among those who co-operate. We are afraid therefore that Mr. RICHMOND's boast about having killed paper mosaic for ever in England will not stand the test of time like his panels.

In whatever way the tesserae are set, much depends on the nature of the cement. MUZIANO, of Brescia, who was long engaged on the mosaics of St. Peter's in Rome during the sixteenth century, claimed to be the first who used oil in his cement, of which the other constituents were powdered travertine and lime made from it. Water cements were used at an earlier time, and sometimes wax was an ingredient. After several experiments, Mr. RICHMOND found that "linseed oil, wax, lime and gold size, held together by finely powdered marble dust, made a very firm-setting cement, which maintained a sufficient elasticity to prevent expansion, and the consequent dropping out of the cubes at a not very distant date. This cement does not dry with any rapidity; it remains in sufficiently malleable condition for a day's work."

The description of the mosaics by the Rev. Canon BROWNE, which is printed on another page, will suggest the subjects and treatment more clearly than could well be done by a layman. The opportunity which was given for an examination of the work on Saturday has enabled us to bear testimony to the conscientious spirit in which every inch of the decoration has been executed. But mosaic should never be judged from any point of view except the one that was contemplated by the artist. After Easter, when the scaffolding has been cleared away, it will be time enough to judge of the effect of Mr. RICHMOND's work. Those who expect something scenic, and anticipate that the resplendence of colour and sparkle of the golden tesserae will symbolise the wealth and power of the City, are likely to be disappointed. Colour-work too often keeps the word of promise to the ear rather than to the eye, and the partial experiments in St. Paul's never realised all that was expected from them. So little is known about colour in this country as applied to buildings, it is perhaps excusable for people to imagine that what they see on the stage could be easily surpassed to a degree that is incalculable with the proper materials. It is forgotten that owing to the difficulty of attaining success there is, as FERGUSSON says, "hardly one single instance known of a complete polychromatic design being successfully carried out anywhere, though often attempted." In a building of the size of St. Paul's it is unreasonable to suppose that a transformation can be accomplished by filling up a spandrel with colour, or even by expending 12,000*l.* on the east end. If the last experiment can be deemed to have attained sufficient success to warrant a large experiment on other parts of the building, the designer and workmen will have gained a victory.

THE ABBEYS AND CATHEDRALS OF SCOTLAND.

AT the meeting of the architectural section of the Glasgow Philosophical Society, Mr. P. M'Gregor Chalmers, architect, delivered a lecture on "The Abbeys and Cathedrals of Scotland." He said :—There is only one reliable guide in the study of the history of the ecclesiastical architecture of Scotland. Local tradition is often interesting, but as a fabric reared by memory and imagination it can aid us but little where scientific accuracy is desired. It might be thought that in the mass of literature on the subject published since Scott revived the dying interest of Scotsmen in the beauty of their own country and in its history, there would be found all the material necessary for the history of our old abbeys and cathedrals. But a somewhat extensive acquaintance with that literature

convincing one that in very few instances is the printed page more than a record of local traditions. The writers generally have been men of culture, but with very few exceptions they have had no knowledge of art. They stumble and fall at every turning. We find no parallel to this in the modern literature of science, and yet art is as practical as science. When we turn to ancient charters and documents we may be readily lulled into the belief that we have at last found a sure foundation. But many a wreck can be traced to trust in a defective compass, and the written page of long ago has been a most prolific source of error. A charter runs that King David I. founded the abbey of Melrose. The charter is true. But shall we see King David's work, as we are sometimes told, when we visit the beautiful shrine to-day; and shall we gaze on his statue and that of his queen as they sit perched on their throne in the apex of the east gable? King David's work has long since passed away, and the statues are those of later monarchs. The charter cannot aid us here. But we shall find a better illustration nearer home, in our own cathedral of Glasgow. One of the most interesting chapters in the history of the building relates to the tower. Nothing that is known of Bishop Robert Wishart is more characteristic than his acceptance of a present of timber from King Edward I. of England, in 1291, to enable him to complete the tower of his cathedral, and his misapplying the gift to the construction of engines with which to batter the English in the castle of Kirkintilloch. The record of a later time is that the tower was destroyed about the year 1400, and that it was rebuilt soon after by Bishop Lauder. The present central tower bears the arms of Lauder. Then we are told that the tower Wishart erected was the central tower, and as a necessary sequel to this the nave is said to have been erected in the thirteenth century. This is the statement accepted at the present moment. But allow the mind to harbour a doubt. The nave completed at the end of the thirteenth century? Then not a single stone was laid for about one hundred and thirty years, although all that remained to complete the great fabric was the comparatively insignificant structure at the north-east corner of the building—the very necessary chapter-house and sacristy. Again, for what purpose was the nave erected? Was it to stand, as it does to-day—a barren wilderness—or was it intended for the worship of the faithful who should gather round its sacred altars? Surely it was built for some useful purpose; and yet we are asked to believe that it stood empty for more than one hundred years, as there is no record of the dedication of any altars until the beginning of the fifteenth century. What, then, was this thirteenth-century tower? In a study of this point made some time ago, which will shortly be published, it was conclusively proved that the tower erected by Wishart and restored by Lauder was the north-western tower, so foolishly removed sixty years ago. The nave is fourteenth-century work. A charter of itself is but a poor guide, therefore. It was a favourite practice in the olden time for the local magnate or the chief prelate to have his name or arms carved on the building erected or restored by him, and thus to preserve the record of his act of generosity. In many cases these records in stone supply us with the most definite information regarding the age of the work. Frequently they are the only source from which we draw that human interest which gives vitality to our study. But can it always be said that he who runs may read? Turn to Glasgow Cathedral again—to the remarkable aisle of Car Fergus—the lower storey of a never-completed south transept. This is popularly known as Blackader's Crypt, and that archbishop's arms will be found on two buttresses on the exterior, and on the groined roof in the interior. Of this building it has recently been written, "Anyone unfamiliar with the later Scotch styles, and who did not know that this crypt was erected by Bishop Blackader in the sixteenth century, would be very much puzzled by this building. It is as unlike English work of the same period as can well be imagined. At first sight, looking at the outside of it, one would say that it was Early English. The builders seem to have done their best to copy from the adjoining crypt; the plan of the window joints is very much the same, and even the mouldings, but I have never seen an instance where a late workman has managed to make an early capital or base. The late work is sure to be detected there, if nowhere else; and here, as both can be seen from the same spot, it is interesting to compare the one with the other." Let this statement be subjected to the criticism it richly merits. We are asked to believe that the artist, working about the year 1500, in order to secure some appearance of uniformity, deliberately copied not only the general design, but also the very delicate mouldings of his predecessors' work of 250 years before, in walls and piers which are comparatively obscure, but that, when he came to the more prominent and attractive carving and the great vaulted roof which bulks so largely in the eye he relapsed into the style of his own day. Nor can it be omitted that at the very moment when this desire for uniformity is supposed to have existed the

rood-screen, standing in the very centre of the great church, and the observed of all observers, was erected in a style true to its own period, and utterly unlike its surroundings. That there was imitation of early forms for the sake of unity of design in this case or in any case in Scotland cannot be maintained. Had there been a more careful examination the difference referred to in the mouldings of capital or base would have been seen to be non-existent, and it would have been recognised that the resemblance of this building to thirteenth-century work was due to the fact that it is thirteenth-century work. To maintain otherwise would compel us to assert that the supposed copyist stamped almost every stone of walls and piers with the masons' marks of the thirteenth century, and that when he came to the carving and the groined roof and to the rood-screen he omitted them altogether, and in this was again true to his peculiar habit. The arms of Archbishop Blackader are not a record of building, but only of restoration. From this illustration it will be seen that the presence of name or arms is not an infallible guide to us in our study. That infallible guide we must secure in the art itself. In whatever field of study we may search, in the history of literature, of science or of art, we shall always find that every work to the production of which man has devoted the best of mind and hand is indelibly stamped with the impress of his own individuality and of his time. The distance that separates a Caedmon or Alfred from a Swinburne or Henley may be bridged, and each arch stone will be a poem. So it is with architecture. The Christian architecture of the Romans, as first introduced into Britain, was far removed from, and had little in common with, the delicate Gothic work of the end of the fifteenth century, and yet the progress from the one to the other was certain and steady. Only by the aid of the art itself in all its minute changes can we hope to travel the road that lies over these 1,200 years. Mr. Chalmers afterwards exhibited a series of views covering the country from Kirkwall to Durham, and from St. Andrews to Iona, and arranged in chronological order. Beginning with the best authenticated site of St. Ninian's "White House" at Whithorn, the early MSS. and crosses, the progress of the art was shown from the church of St. Regulus at St. Andrews of the middle of the eleventh century; through the twelfth century as in Durham, Dunfermline and Jedburgh; the thirteenth century as in Glasgow; the fourteenth century as in Melrose; the fifteenth as in Linlithgow, Roslin and Lincluden, until he came to the work of the early sixteenth century, as in Paisley, when the art was engulphed in the convulsive Reformation.

A SCHOOL OF ARCHITECTURE AND APPLIED ART.

THE following scheme has been prepared by the special sub-committee appointed to consider and report upon the proposed Public School of Art, Architecture and Applied Arts for Liverpool.

A permanent board of art, architecture and applied arts to be constituted, in which the City Council shall have a considerable representation, and be associated with representatives of educational institutions or societies taking part in the scheme. The constitution of the board to be as follows:—The lord mayor, the chairman of the library, museum, and arts and technical instruction committee, the chairman of the arts and exhibition sub-committee, the chairman of the technical instruction sub-committee, two other representatives nominated by the City Council, the principal and one representative of the senate of University College, two representatives of the Council of University College, the president and one representative of the Liverpool Architectural Society, one representative of the Liverpool Academy of Fine Arts, one representative of the Liverpool Master Builders' Association, one representative of the Building Trades Federation and the professor of architecture—sixteen members in all.

The board to be responsible for the educational and financial organisation and administration of the school, and in particular to (1) conduct the Central School of Art in Mount Street, which shall include an efficient life school; (2) establish branch schools of art (up to three in number) in suitable localities, if and when such schools are found necessary; (3) establish a studio for modelling and sculpture; (4) arrange for courses of instruction in architecture at University College; (5) make provision for instruction in (a) carving in stone, wood and marble; (b) colour and the use of pigments for mural decoration and glass-painting; (c) plaster-work; (d) metal-work, and also, if thought desirable, to establish classes in other industrial arts, such as pottery, goldsmiths and silversmiths' work, book-binding, typography, engraving and etching, and lithography.

Acting subject to the direction and decisions of the board, the professor of architecture to be ultimately the director of the proposed school; but, until he shall have organised and put into working order the courses for architecture, sculpture and the applied arts, the head master of the School of Art in Mount

Street to continue to be the head thereof, and responsible directly to the board for the education given in the school. During the period just referred to the professor of architecture to have full access to the School of Art, and any recommendation from him as to the courses of study to be pursued by students in architecture, sculpture or the applied arts to be carried out by the head master of the School of Art. The expenditure involved in carrying out such a scheme is estimated at 1,000*l.* per annum, independently of the revenue derived from fees, capitation grants from the Science and Art Department and the City Council, and from the University College Art Chair endowment fund. It would be necessary that such an amount should be allocated to the board by the technical instruction sub-committee from the funds at their disposal. That this scheme be adopted for an experimental period of five years, upon the understanding that any change in the constitution shall require the approval of the City Council on the recommendation of the board.

The report also states that University College is prepared to associate the Roscoe Professorship of Art with a central scheme of art instruction in the city, and would allot to it the income from the endowments of the chair. They would further provide suitable accommodation for the professor of architecture and his classes. Also, the directors of the Liverpool Institute are prepared to hand over to the proposed board for a nominal consideration, and for an experimental period of five years from January 1, 1894, the present Liverpool School of Art, Mount Street, on the understanding that the work of the present school will be fully maintained during that period, and that the existing grants from the City Council are continued.

MEMORIES OF OLD LONDON.

A LECTURE on the "Old Traditions and Memories of our Own Neighbourhood" was delivered before a numerous audience at the London Institution, on the 1st inst., by the Rev. Canon Benham. Confining his sketch to portions of London in the neighbourhood of the Bank, Royal Exchange, Broad Street, Coleman Street, City Road, Bunhill Row and Moorfields, the lecturer, says the *Standard*, contrasted the present condition of this part of the Metropolis with what it was several centuries ago, and by the aid of maps of old and new London showed how the courses of many of the streets had been changed, how old churches and other buildings had been removed and modern structures erected upon their sites, and how the fields which used to surround the City had been gradually absorbed as the suburban extensions had progressed. He stated that one hundred years ago there were large gardens in the immediate neighbourhood of the Bank. At this time neither Moorgate Street nor Gresham Street existed, although what is now known as Gresham Street was then called Cateaton Street. This change of name was said by Albert Smith—although the story was a pure invention—to have been brought about at the instigation of a maker and vendor of sausages and meat pies, whose business was carried on at Cateaton Street, and who, not liking the manner in which the City wits associated his wares with the name of the thoroughfare in which they were sold, got elected to the Common Council, and induced that body to re-christen the street, whereupon, added the scribe, "his business increased amazingly." Near Bartholomew Lane stood a church, which was removed in 1841, and rebuilt in Moorfields. The lecturer remembered the burning of the old Royal Exchange, and the rude way in which the fire was pictured in the newspapers of the day. The present building covered more space than the one it had superseded, and on the open ground in front of it formerly stood two blocks of buildings. On part of the site of the present Exchange stood the little church of St. Benetfink or Benetfinch, the last syllable denoting the name of the donor, who was still commemorated by Finch Lane. In this church Richard Baxter was married, and Cardinal Newman was born close by, in Finch Lane. The church was pulled down in 1844. Another church, called St. Christopher-le-Stocks, stood in the neighbourhood, its second appellation being derived from the stocks, for the correction of offenders, which stood in the vicinity. This edifice was built in the thirteenth century, was damaged by the Great Fire of London, and restored in the Wren style, grafted on the Gothic remains. At the time of the Gordon riots, owing to the fears then entertained that the low tower of the building might be used by a mob desirous of storming the Bank, the church was removed, under the provisions of a special Act of Parliament, and its site absorbed in that of the Bank. Coleman Street, whose courts and alleys still retained their ancient names, was so called because of the coal-men or charcoal burners who had settled there in the thirteenth century; but later on, in the sixteenth and seventeenth centuries, Coleman Street became one of the most fashionable parts of the City, and when Charles I. attempted to seize the five members, they were for a time concealed in a gentleman's house in that thoroughfare. Moreover, there was a house in

that street which used to be frequented by Oliver Cromwell. In 1781 Robert Bloomfield, the author of the "Farmer's Boy," lived in Bell Alley, where he learnt to make shoes and wrote his celebrated poem. Part of London Wall stood at the end of Coleman Street, and much of it was intact in the eighteenth century. Indeed, some of the old wall still existed in that neighbourhood, but was hidden by the buildings erected against and upon it. Beyond the wall was the moor, which gave its name to Moorfields. Close by were Cripplegate and Bishopsgate, and beyond all was open as far as Islington. Outside the wall was a foul and noxious ditch to which reference was made by Shakespeare, who made Prince Henry speak of "the melancholy of Moor-ditch," whereon Falstaff replied, "Thou hast the most unsavoury similes." Islington, or Isledon, as it was then called, was a secluded village, and Chelsea was also a village far away from the buildings which then constituted the Metropolis. The moor was often under water, which, when frozen, was resorted to by skaters from the City, who in those days used mutton bones instead of the modern skate-irons. Near Isledon the Londoners went wild-duck shooting, and the Lord Mayors used to hunt in the district, their dog-kennel occupying the site of Finsbury Pavement, opposite South Place. In 1415, the year in which the battle of Agincourt was fought, the Lord Mayor, Thomas Falconer, had the wall broken and a gate built, through which the citizens went upon the moor. A causeway was made to Isledon. To the left stood St. Giles's Church, which was built in the reign of Rufus. It was not to be supposed that the growth of London had always been continuous; on the contrary, owing to the great outbreaks of pestilence which occurred in the fourteenth century, two-thirds of the population of the entire nation were swept away, the terrible "Black Death" of 1349 destroying one-half the people of Europe. The sites of Charterhouse Square and Merchant Taylors' School became the burial ground of 50,000 persons in that year. Then followed cattle murrains and other visitations, during which the air was so tainted by rotten carcasses that the birds died while flying over the pestilential area. In those days the population of Cripplegate consisted mainly of foreigners. With regard to Grub Street, whose change of name to Milton Street was to be regretted on account of its association with that class of literature which had so often been criticised by well-known writers, the thoroughfare was composed of a wretched type of wooden houses, the majority being of only one storey. Fox, the author of the "Book of Martyrs," lived and died in Grub Street; and Daniel Defoe died in Ropemaker Alley, which ran in a zigzag direction out of that thoroughfare. In 1710 something was done in the way of draining the moor, and there was formed what might be termed the first public park or recreation ground for the City of London. Here all kinds of sports and exercises were indulged in, duels with rapiers were frequently fought, and laundresses dried their linen upon the turf. In 1645, after a survey made by Inigo Jones, the Moor Ditch was filled with earth and covered in. Moor Gate was rebuilt in 1673, the gateway being made higher than the other City arches because of the large quantities of hay that were brought to that part of London. In 1761 the gates generally, which had then become useless, were taken down, and the stones were deposited on one side of Old London Bridge to protect the piers from the fierce rushing of the Thames water. In 1549 the Protector, Somerset, ordered that the dead should be removed from their resting-place under the shadow of St. Paul's, and more than one thousand cartloads of their remains were taken to that part of the moor where the City Road met Tabernacle Street. Here, instead of being reburied, they were covered with earth, and the great heap thus formed was called "Bone Hill," whence had originated the name Bunhill Fields. It was here that John Bunyan was interred; he died in Holborn or Snow Hill. There used to be three sets of Moorfields, Lower Moorfields being carefully laid out for recreative purposes. This part of the moor, which formed the site of Finsbury Circus, was the property of the Fynes or Fiennes family, and was given to the City Corporation by its last owners, who were two sisters of that name. It was to have been kept open for public use, but in course of time the land was diverted from that purpose and built upon. At one time snipe-shooting used to take place in what was now St. Martin's-in-the-Fields, and Moorfields was then the accustomed resort of courtiers and people of fashion. It was here that the public used to be diverted by the sight of the thief-whippings which took place at periodical intervals, while stalls were erected on the ground, thimble-rigging flourished, Merry Andrews and jugglers went through their performances, and here and there grave ambassadors might be seen walking with noblemen and other persons of rank and position, discoursing on affairs of State. In 1641 the City Corporation granted to the Artillery Company the lease of the premises they still occupied. At the time of the Plague, Cripplegate suffered more severely than any other part of London. It was, however, untrue to say that Finsbury Circus was the site of the great plague-pit. That was just outside St. Botolph's, Aldgate, and there was a smaller pit at the junction of Old Street and

Goswell Road. It was the lecturer's belief that Defoe was not buried in Bunhill Fields, but in the plague-pit, according to his own wish. John Milton died in Bunhill Row in 1674. References to the Great Fire of London, the establishment of the Bethlehem Hospital, whose inmates at one time were made a show of, and other incidents connected with the history of London were also referred to, and in conclusion the lecturer stated that there was a lady still living in her hundred and first year who could remember Moorfields as far back as 1801, when no buildings existed there.

TESSERÆ.

Justinian as a Builder.

WHATEVER were the views of Justinian, the number of buildings which he erected, even taking into our consideration the resources of a long reign, almost exceed belief. And of these architectural labours it has been too harshly said "that they were cemented with the blood and treasure of his people." His pious munificence was seen in the construction of churches, whilst almost every city in the empire obtained the solid advantages of bridges, hospitals and aqueducts, and he consulted his own ease in the restoration of the palace at Byzantium. There was everywhere a display of magnificence and of the most costly ornaments. But it is in the temple, now the mosque, of St. Sophia, which was originally raised by Constantine, but rebuilt from the foundations by Justinian, that we are to look for all the skill, taste and munificence of the age. It had been twice destroyed by fire, but it was now to rise resplendent on an improved and extended scale. The principal architect was Anthemius, who presided over the imperial works. He formed the design, and it is said that his genius directed the hands of ten thousand workmen. Justinian, clad in a linen tunic, every day surveyed the rapid progress, and six years had not elapsed when he had the happiness to behold its completion and to assist at its solemn consecration. After some years, however, an earthquake overthrew the eastern part of the dome. The perseverance of the same prince again restored its splendour, and in the thirty-sixth year of his reign he celebrated the second dedication of a temple which, after twelve centuries, remains a stately monument of his fame. Of this celebrated structure, of its aerial domes lightly reposing on its arches, its columns of granite, of porphyry and of green marble, its semi-domes, its walls encrusted with marbles, its various members, admirable by their size and beauty, and all embellished by a rich profusion of jaspers, gems and precious metals, it is not necessary to repeat the descriptions which many authors will supply. But though this venerable pile, which could excite the admiration of the Greeks, even now, as shorn by Turkish fanaticism or the corrosion of time of its more perishable ornaments, continues to furnish a rich repast to the curiosity of the traveller, it is generally agreed that a striking deficiency is often perceptible in the combinations and contrasts of parts, and that Anthemius, had he been content to copy the exquisite models which in his time still adorned the cities of Asia Minor and the provinces of Greece, might have produced a work which would at once have been more sublime and beautiful. But for this a refined nicety of taste was necessary, which was no longer to be found.

Early Use of Iron in Europe.

The iron-using people buried their dead in tumuli, sometimes burning the corpse, and at others laying it at full length. Sometimes, as in some of the tombs round Stonehenge, they made use of the tumuli of the Bronze Age, so that after digging through the secondary interment of the one age, you come in the centre of the mound to that over which the mound was originally heaped. That they were, comparatively speaking, highly civilised there can be no doubt. In Gaul Cæsar tells us that they opposed the Roman armies in the field with chariots and cavalry, and fought for a whole day with the Roman fleet off the coast of Brittany. The actual date of the introduction of the use of iron into the area north of the Alps and the Pyrenees cannot be satisfactorily ascertained, but it seems pretty clear that wherever the Romans came in contact with Gauls or Britons or German tribes, they found them armed with weapons of iron. The Scots, according to Tacitus, used chariots and iron swords in the battle of the Grampians—"enormes gladii sine mucrone." The Celts of Gaul are stated by Diodorus Siculus to have used iron-headed spears and coats of mail, and the Gauls who encountered the Roman arms in B.C. 222 were armed with soft iron swords, as well as at the time when Cæsar conquered their country. Sir John Lubbock thinks it probable that the commercial organisation which introduced bronze introduced also iron, and it is very possible that the Phœnician, Etruscan and Greek traders may have brought in the art of reducing iron ore into the region where bronze had been previously used. And if from any cause or

other the tin trade was interrupted, as it certainly must have been by the break-up of the Phœnician and Etruscan power, to say nothing of the wars which must have happened from time to time between the tribes of France and Germany, the people cut off from the supply of tin must either have used copper or have been obliged to apply iron for those purposes to which they had applied bronze. This certainly may be one of the causes of its introduction, but at the same time it must be admitted that the patterns of the Iron Age differ from those of the Bronze, and the weapons are of a different character. Did the Celts, the conquerors of the Iberian race north of the Alps, invade Europe, bringing their iron weapons along with them from the East? The long sword, made for cutting rather than for thrusting, was certainly not derived from Greece or Italy, and it appears for the first time in the West in the hands of the Celts and the Germans. It is by no means improbable that the civilisation of the Iron Age was in part introduced into Europe by the Celtic and Teutonic invaders from Central Asia.

The Courses at Olympia.

The open spaces between the buildings were filled with statues. These were of two kinds, either votive offerings of cities or individuals, erected here as in the most celebrated place of assembly for the whole Hellenic world, or statues of men who had won the victory of the Olympian contests. These statues, which with few exceptions were of bronze, were destroyed by fire at the Gothic invasion; the stone pedestals, with their inscriptions, were overturned, deported and destroyed in Byzantine times, when the temple of Zeus was converted into a fortress; still a few of them remained near their original sites, among them some of those described by Pausanias in his "Itinerary." Hence it is possible for us to make out here and there the original disposition of the statues, and to determine the routes which once traversed this forest of statuary. The main route lay through the pompic (processional) gate on the south; around the altars spaces were left free for the people to assemble. Inside of the wall, on the east side, was a portico 100 metres long, the Echo Hall, the northern end of which faced the last of the row of treasuries; at its southern end it abutted on the Leonidaion, a building erected by one Leonidas for the entertainment of distinguished guests, while the great mass of the people camped in tents around the walls of the Altis. But the ground outside of the Altis was also covered with buildings of all sorts. Eastward lay the Stadium, accessible through the "private" entrance lying between the Echo Hall and the most easterly of the treasuries. This gave admittance to the judges and the contestants at the beginning of the games. It was an arched passage leading to the starting-place for the runners, and the furrowed stones on which the runners took their places are still in place, as also, at the opposite end, the goal. All the other contests were also carried on here, except the horse and chariot races; for these the Hippodrome was intended. It lay to the south of the Stadium, but the overflows of the Alpheios seem to have destroyed all traces of it. To the south stood an edifice which consisted of two aisles lying in an east-and-west direction, with a quadrangular court in the middle. These two aisles were separated by a central line of columns, and were terminated at their western ends by a round niche. This building is nearly contemporary with the temple of Zeus. It is supposed to have served as a meeting-place for the Olympic Council, while the quadrangular space in the middle was, in all probability, the sanctuary of Zeus Horkios, before which the contestants had to make oath that they would strictly observe the laws of the contest. The building is one of the most important remains of State architecture in the fifth century. To the south of the council-house was a hall fronting on the great highway leading up from the Kladeos to the principal entry. Between the Kladeos and the Altis on the west was a series of magnificent buildings.

Greek Myths.

We can scarcely read the legends of Herakles and Demeter, of Theseus, Kadmos, Perseus and a host of other mythical heroes, without feeling that a few simple phrases might well have supplied the germ for the most intricate of these traditions. Every incident in the myth of the Eleusinian Demeter may be accounted for, if only men once said (with the conviction that the things of which they spoke had a conscious life), "The earth mourns for the dead summer. The summer lies shut up in the prison of Hades the unseen," or, as in the language of the Northman, "She sleeps in the land of the Niflungs, the cold mists, guarded by the serpent Fafnir; and the dwarf Andvari keeps watch over her buried treasures." The tale of Endymion seems to speak for itself. "The moon comes to gaze on her beloved, the sun, as he lies down to sleep in the evening." In the story of Niobe we seem to see the sun in his scorching power consuming those who dare to face his dazzling brightness; in that of Orpheus, we seem to hear his lamentation for the beautiful evening which has been sung by the serpent of the night, and which he brings back to life only to lose her at the gates of day. In the myth of Europe we

have the journey of the sun from the far East to the Western land, until Telephassa, the far-shining, sinks down wearied on the Thessalian plain. Still more transparent appear the tales of Kephalos and Daphne. Prokris, even in the mouth of the Greek, is still the child of Herse, the dew; Eos is still the morning; Kephalos still the head of the bright sun. In Daphne we seem to behold the dawn flying from her lover and shrinking before his splendour. In the Homeric Hymn, Leto, the night dark and still as death, promises that Phoibos shall long abide in Delos, the bright land. Doubtless she made the same promise to Lykians, Argives, Arkadians, Athenians and all others who called themselves the children of the light; but the sun cannot tarry, and in spite of her plighted word he hastens onward to slay the serpent of darkness. In Herakles we see the sun in other guise, loving and beloved wherever he goes, seeking to benefit the sons of men, yet sometimes harming them in the exuberance of his boisterous strength. In the tale of Althaia we read the sentence that the bright sun must die when the torch of day is burnt out. In Phaetbon we seem to see the plague of drought which made men say, "Surely another, who cannot guide the horses, is driving the chariot of the sun." The beautiful herds, which the bright and glistening daughters of early morning feed in the pastures of Thrinakid, seem to tell us of the violet-coloured clouds which the dawn spreads over the fields of the blue sky. In Bellerophon, as in Perseus, Theseus, Phoibos and Herakles, we find again the burden laid on the sun, who must toil for others, although the forms of that toil may vary. Perseus goes to the dwelling of the Graiai as men might have said, "The sun has departed to the land of the pale gloaming." When Perseus slays Medousa, the sun has killed the night in its solemn and death-like beauty, while the wild pursuit of the immortal Gorgons seems to be the chase of darkness after the bright sun, who with his golden sandals just escapes their grasp as he soars into the peaceful morning sky, the Hyperborean gardens, which sorrow, strife and death can never enter. In the death of Akrisios we have the old tale which comes up in many another legend, where Oidipous and Theseus mourn that they have unwittingly slain their fathers.

Russian Malachite.

As a substance available for veneering, malachite is found chiefly in a single locality in Russia, in lumps of moderate size rarely so large as a child's head, and is cut for use into thin slices, which are fastened on a copper, iron or marble surface, prepared for the particular use designed. Formerly the slices were with straight edges, and were put together without much reference to the continuity of the natural lines of veining; but, by a very ingenious set of contrivances of modern date, most of the surfaces are now curved, and not only fit into corresponding curves, but the veining is made continuous as in nature, so that extremely simple but elegant patterns are produced, giving an appearance as if the whole of a large surface were of one piece. The effect is greatly heightened by a peculiar cement, made of broken fragments and powder of the malachite itself, imitating accurately a natural breccia frequently occurring in the lumps. The rounded and other surfaces are all cut out of the solid block by saws constructed for this purpose, and the labour incurred in making any large object, together with the enormous amount of waste in the raw material, combined with the original costliness of the stone, render the expense very considerable. The prime cost of fine malachite at St. Petersburg varies from 12s. to 15s. per pound avoirdupois, according to the quality, and at least two pounds are wasted for every pound used.

Time and Works of Art.

A complaint has been made of the short-lived duration of works of art, and particularly of pictures; and poets more especially are apt to lament and to indulge in an elegiac strain over the fragile beauties of the sister art. The complaint is inconsiderate, if not invidious. They will last our time. Nay, they have lasted centuries before us, and will last centuries after us; and even when they are no more, will leave a shadow and a cloud of glory behind them through all time. Lord Bacon exclaims triumphantly, "Have not the poems of Homer lasted five-and-twenty hundred years, and not a syllable of them is lost?" But it might be asked in return, "Have not many of the Greek statues not lasted almost as long, without losing a particle of their splendour or their meaning, while the Iliad (except to a very few) has become almost a dead letter?" Has not the Venus of Medicis had almost as many partisans and admirers as the Helen of the old blind bard? Besides, what has Phidias gained even by the discovery of the Elgin Marbles? Or is not Michel Angelo's the greatest name in modern art, whose works we have scarcely seen except in description and by report? Surely there is something in a name, in wide-spread reputation, in lasting renown, to satisfy the ambition of the mind of man. Who in his works would vie with nature? An epitaph, an everlasting monument in the dim remembrance of ages, is enough below the

skies. Moreover, the sense of final inevitable decay humanises, and gives an affecting character to the triumphs of human art. Imperishable works executed by perishable hands are a sort of insult to our nature, and almost a contradiction in terms. They are ungrateful children and mock the makers. Neither is the noble idea of antiquity legibly made out without the marks of the progress and lapse of time. That which is as good now as ever it was seems a thing of yesterday. Nothing is old to the imagination that does not appear to grow old. Ruins are grander and more venerable than any modern structure can be, or than if they had been kept in the most entire preservation. They convey the perspective of time. So the Elgin Marbles are more impressive from their mouldering imperfect state. They transport us to the Parthenon and old Greece. The Theseus is of the age of Theseus. The Apollo Belvidere is a modern fine gentleman, and we think of this figure only as an ornament to the room where it happens to be placed.

Mosaics.

The name mosaics, as is well known, is given to the coloured imitations of a painted pattern by employing fragments of marble, stones, different coloured enamels, suitably cut, which are united together side by side, and also fastened together by means of a fine mortar or cement. If it were possible to make a mosaic with elements as fine and as compact as the threads of tapestries, the work would appear to occupy a place between an oil-painting and a Gobelin's tapestry; it resembles the latter because it is the result of the juxtaposition of coloured elements of an appreciable size; and it approaches to the nature of a picture by a uniform surface rendered brilliant by means of the polish it has received; besides, the contrast of opaque and vitreous elements resembles that of opaque and glazing colours in oil-painting. But mosaic being made to serve for pavement, or at least to be exposed to the changes of weather, the humidity of ground-floors, &c., resistance to these destructive agents must be its essential quality; on the other hand, the place it generally occupies in edifices does not permit the eye to seize all the details we look for in a picture; we wander from the aim when we pretend to give to works of this nature the finish of painting; we then confound two arts entirely distinct in aim and also in the nature of the coloured elements of which each of them makes use.

Jan Torrentius.

The last of the Dutch painters who came to England, and who, if not patronised by Charles, sold him two or three of his works, was a proof of the degradation of which art is capable. Jan Torrentius was born at Haerlem in 1589, and began by drawing chairs, tables, glasses, vases and scenes of low life, which he executed with sufficient truth and finish to gain a good name and high prices. It was not long, however, before he became imbued with the disgusting doctrines of a society of Adamites and prostituted his pencil to their uses. He had at least, as Walpole says, the merit of practising what he preached. His life was a succession of profligate excesses; and his studio the meeting-house of his licentious confraternity, for whom he produced pictures of the grossest obscenity. To the credit of the authorities of Haerlem, they determined to try him; and as he stoutly denied his connection with the society, he was put to the torture and condemned to an imprisonment of twenty years. From this he was released, as it is said, at the instigation of the English ambassador and escaped to London. Here he resumed his old practices and debauched pencil, but met with little encouragement; and returning to Amsterdam, lived in concealment till he died in 1640.

Phidias as a Sculptor.

The grand distinguishing quality of Phidias, when contrasted with almost every other artist, ancient or modern, is the entire absence of anything approaching to mannerism or conventionality—a complete abnegation of self. Art so effectually hides art that we never think of the master. Nature has nothing of mannerism, neither had Phidias; his works have none of the severe, dry idealism of the Apollo, and they possess far more beautiful nature and simple grandeur of style and form than the Laocoon, or the statue known as the Fighting Gladiator, or the Faun. There is in these works of Phidias no attempt at disguise or trickery; everything is made out. Michel Angelo said:—"The sculptor never yet conceived a thought that yielding marble would refuse to aid, but never with a mastery he wrought Until the hand the guiding mind obeyed." Here, in these works, most assuredly there is no lack of power. The sculptor, perfect master of his art, intellectually and mechanically, appears to revel in difficulties and invariably succeeds in evolving beauties. Campbell somewhere observes:—"These great works do not appear to me to have been wrought with toil or long-continued labour; they appear as though the marble, in a state of fusion, had been run into moulds, thus producing works of surpassing beauty."

NOTES AND COMMENTS.

THE perfection attained by the photogravure process in Paris is suggested by a new print issued by the Librairie de l'Art, after the painting *Un excellent Pot au Feu*. For breadth of treatment and vigorous light and shade it will sustain comparison with the English mezzotints of the last century. The subject is simple, a poor *curé* watching the preparation of his dinner by his old housekeeper. It might have been inspired by the story, "Autour d'une Source," which is the masterpiece of GUSTAVE DROZ. In Mdlle. DESLIEN'S picture, a subject that has been generally vulgarised becomes fascinating. The new series of *L'Art* that is issued from the same office continues to excite surprise by the importance of the large etchings which accompany every number, for how can two dozen prints be bestowed with a publication costing 60 francs a year, when the majority are each worth that sum? It is a question which is as puzzling to dealers as to the public.

It is hard on poor people who are occupants of a house that cannot resist an extraordinary gale of wind if they have to clear out in a hurry and their furniture is considerably broken. As recent legislation inspires a belief in the humbler classes that if they suffer inconvenience somebody must compensate them, it is no wonder that in cases where tenement houses are injured the aid of the courts should be sought. The gable of a house in Dundee was blown away during the November gales, and the tenants fled with their belongings. Subsequently they brought an action against a financial association that held mortgage on the property. The Judge who tried the case decided against the tenants. He laid down the law on the subject by saying:—"A landlord does not guarantee his tenants against storms and earthquakes any more than he guarantees them against consumption or influenza or typhus or cholera. He undertakes to give a habitable house, so 'sound and watertight' as to afford a tolerable shelter from the weather and affording such comfort as the tenant is willing and able to pay for, and is prepared to accept as sufficient, or he ought not to take the house. If the landlord has cheated him, or wilfully maltreated him, or negligently failed in his duty, he may obtain damages against him just as against any breaker of contract or other wrongdoer. But before he can obtain damages he must both aver and establish fault against the landlord. In their averments, I am of opinion that the pursuers have failed to set forth any intelligible fault, or, in other words, to state anything that the defenders could have done to prevent the accident to this gable, as well as state what they might, had they been ordinarily far-seeing, have been reasonably expected to do. It is said that the gable was 'jerry built.' But to say that a wall is 'jerry built' is to say what could be said with truth of thousands of walls in Dundee, of tens of thousands in Glasgow, and probably of half the houses in most of the brick-built English towns. Tenants know about jerry building just as well as people who lend money upon jerry-built houses. The pursuers do not say when they went into or near this frail tenement that they did not know that it was not of substantial masonry; and if they knew, they went to the neighbourhood of a new danger and took their chance of it. I hold therefore that there is no sufficient averment of fault." The tenants will not be satisfied with the declaration, for they will say that if the law insists on drains being in a safe condition, why should gables be neglected?

It is to be hoped the litigation arising out of the erection of flats at the corner of Kensington Court has come to an end, since at the last hearing the County Council, or rather the ratepayers of the metropolis, were mulcted in costs. It will be remembered that in December last a summons was taken out with the object of obtaining an order for the enforcement of penalties against Mr. E. LAWRENCE, at the rate of 40s. a day, since October 15, 1892, for not reducing the height of the building. The magistrate took time to consider his decision. On Friday, the 2nd inst., it was given. Mr. CURTIS BENNETT said it was proved that the defendant gave the building up to the owner on February 3, 1893, and from that date he had not continued the offence charged against him. The question arose whether under JERVIS'S Act an offence had been

committed within a period of six months. The summons was issued in December last, and, as defendant gave up the building in February, no offence had been committed by the defendant within a period of six months. The continuing penalties were for not pulling down the building, which the defendant had no right to do. If he went on the premises he would be a trespasser. The question involved a loss of over 700l. a year to the defendant if he were liable for the continued penalties for his natural life for not doing that which he had no power to do. If he attempted to comply with the order, he would be immediately stopped by the Court of Chancery, because he had given up possession of the building. He found, in fact, that there had been no continued offence since February 1893, and he held under JERVIS'S Act that the six months' limit had expired, and that by law a builder could not continue an offence after he had given up possession. The summons was accordingly dismissed, and the London County Council were ordered to pay five guineas costs. Opinions may differ about the principle involved, which is whether the height of a building is to be determined by the width of the street on its longer or shorter side, but few will hesitate to agree that the County Council could have regulated the height before the works were started; and, in the second place, that it is a hardship on the inhabitants to have to pay a very large sum for law costs which were incurred in the endeavour to cloak negligence on the part of the Council.

A DEPUTATION from the Edinburgh Architectural Association on Wednesday attended the meeting of the Town Council, to offer some suggestions about the scheme for the rebuilding of the North Bridge, Edinburgh. Mr. W. W. ROBERTSON, the president, said that what they desired to impress upon the Corporation was that in the designing of the new bridge it was needful that the very highest architectural skill that could be procured should be conjoined with that of the engineer who was invited to design the structure. Although the conjoining of architect with engineer was unusual in Edinburgh, it had been done repeatedly in London with the very best results, notably in the case of the Tower Bridge and of the St. Pancras railway station, and on the Continent it was much more frequent. As to the buildings at the north end of the North Bridge, they respectfully wished the Corporation to use all their influence to see that the present restriction upon the height of these buildings should be maintained entire and undiminished. It was not always wise to depend upon beautiful drawings in a matter of this kind; the fact they had to bear in mind was that the proposals of the railway company involved an addition of at least 40 feet to the height of the existing buildings. Looked at from the west, the proposed buildings would wipe out a large part of the view of the Calton Hill. Looked at from the east, the effect of the increased height of the buildings would be most disastrous. From the Castle on the one hand to the SCOTT monument on the other the buildings would extend right across as a huge curtain, and fill up the valley to the vertical crag of the Castle. The carrying of the buildings up to a height of 100 feet would be to utterly ruin the aspect of the Register House, one of the best buildings in the city, and by being very much higher than the General Post Office on the opposite side it would destroy the aspect from the upper end of the bridge, with the Register House closing the vista. The Lord Provost expressed his satisfaction with the aim of the Association, and said the suggestions would receive the consideration of the Council.

IN July two British Institution scholarships (one of the value of 75l. and one of 50l.) will be offered to students of painting one of 75l. to students of sculpture, and one of 50l. for students of designing in black and white. The scholarships are tenable for two years. The competition is open to all art students who have obtained a gold medal, a silver medal, or a prize of 15l. in any art school of the United Kingdom. The subjects of the original designs which are to be among the examples submitted will be for painting, *Diana and Endymion*; for sculpture, *The Flight of Aeneas from Troy*; and for black and white the four lines with which GRAY'S "Elegy in a Country Churchyard" begins.

THE MOSAIC DECORATION OF THE CHOIR OF ST. PAUL'S.*

THE eight spandrels of the dome of St. Paul's were filled with mosaic by Dr. Salviati of Venice, from designs by Mr. G. F. Watts, R.A., Mr. A. Stevens, and Mr. Britten, during the years 1863-92, the subjects being the Four Evangelists (St. Matthew and St. John, Mr. Watts; St. Mark and St. Luke, Mr. Britten), and the four greater Prophets (Mr. Stevens).

In March 1891, when the decoration of the eastward part of the choir was under consideration, Messrs. Bodley & Garner recommended to the decoration committee that Mr. W. B. Richmond, A.R.A., should be consulted. Mr. Richmond proposed that the decoration of the choir with mosaic should be commenced. He had made a careful study of the methods employed by the early workers in mosaic, especially at Ravenna, and he recommended that the smooth modern method should be abandoned and the bolder methods of the ancients be adopted in its place. These proposals were accepted. Mr. Richmond entered into an engagement to provide designs for the work for the three years ending in the spring of 1894, and to give his time and attention almost exclusively to this work at a very modest annual stipend suggested by himself. The arrangement recalls some of the most artistic periods of the Middle Ages.

The bay of the choir was originally occupied by stalls, the entrance to the sanctuary from the north and south being by the square openings which are now behind the new reredos, with the beautiful hand-wrought iron gates of Sir Christopher Wren's time. When the organ was removed from its original position across the western of the three bays of the choir in 1860, the choir stalls were moved one bay westward, and the easternmost bay of the choir was left clear, except that the stalls of the dean and residentiary canons and dignitaries were placed here as a temporary measure. In 1871 the organ was moved from the middle bay on the north side of the choir, where it had been placed in 1860 on the advice of Sir Charles Barry, and was put in its present position against the piers at the entrance of the choir. The stalls of the dean and residentiary canons and dignitaries were removed from their temporary position. The old gates which up to 1860 had closed the choir, westwards beneath the organ, were adapted and supplemented, and they now form the ironwork of the brazen gates or golden gates by which the present sanctuary is entered from north and south.

The original sanctuary bay, with its square openings, is quite different in design from the three bays of the choir. Its design is the same as that of the bays leading from the dome into the nave, choir and transepts, the only difference being that it is pierced to give access to the original sanctuary. Sir Christopher Wren carried these five bays up to the spring of the roof with large rectangular panels, and in the roof he broke them into thirty-three smaller panels, deeply sunk, each panel carrying a massive boss of stone sculpture. It is evident that this arrangement does not lend itself to mosaic treatment. The whole of this part of the roof of the sanctuary was covered many years ago with heavy dark gold, quite unrelieved. Everything has now been done to give relief. Lighter gold has been used, the field of the panels has been coloured, the bold sculpture of the bosses has been brought out by light-coloured gesso washed into the inner parts, and all the plane surfaces, whether in gold or in colour, have been broken up by small patterns, scarcely distinguishable from below, to remove any sense of monotony. Similar treatment has been applied to the stone ribs of the roof in the apse and in the choir bay, to the great ring of sculpture round the saucer dome in the choir bay, to the canopy of the clerestory windows, and generally to the parts which do not lend themselves to mosaic treatment.

The apse, the sanctuary bay, and the choir bay may be considered separately for decorative purposes. The treatment of the sanctuary bay may be regarded as an example of what may be done with the four similar bays round the dome, perhaps with less of the main surface covered with gold, and with

less colour on the sunk surfaces. The treatment of the choir bay may be applied not only to the two remaining bays of the choir, but also to the three similar bays of the nave, and the bay in each of the transepts.

First, then, the apse. The three panels in the roof of the apse are naturally of a difficult form, broad at the bottom and narrow at the top. Further, the lower part of each is pierced by a great round-headed window. The space that remains above the window does not afford an easy task for the artist, and the difficulty is not diminished by the curvature of the surface. These difficulties have been met in a way which leaves no trace of them.

The central panel is occupied by the representation of Our Lord in Majesty (Revelation iv.), seated on the rainbow throne. The effect is that of majestic dignity. The light colours of the robe, set out by the dark colours of the neighbouring designs, make this panel clearly visible to the extreme west of the church, especially in the early morning. The background is a whirl of wings, suggesting the idea, "He came flying upon the wings of the wind." Below are the sun and the moon, their light paled in the presence of the greater Glory. The details of the crown are exceedingly rich. The face has received special care, having been more than once re-laid, first to introduce greater strength, and then to remove some of the sternness which the strengthening of the lines had caused. It was a question whether there was really room in this panel for a subject of sufficient grandeur; but the skill of the artist has made the space large enough.

The panels to the left and right of this are occupied by the recording angels. On the north side an angel stands erect, beckoning, with two other angels, carrying crowns; at their feet, arranged so as to occupy the difficult space round the head of the window, are two angels supporting the scroll which represents the book of life (Revelation xx. 12). On the south side the central angel is in the attitude of repelling, and the angels at the side are weeping bitterly; the angels at their feet support scrolls. The central angels in these panels are the nearest approach in Mr. Richmond's work to the Byzantine stiffness of some of the earliest mosaics, the object being to produce a strong contrast with the figure in the central panel.

In a tier below these are two panels on the projecting piers which carry the stone ribs of the roof. They range with four others, two on each side of the original sanctuary bay. On these six figures have been worked in mosaic, typical of six Virtues named in the Revelation. These are, beginning on the north side and passing round to the south:—1, Hope; 2, Fortitude; 3, Charity; 4, Truth; 5, Chastity; 6, Justice.

Lower still is the frieze below the cornice, which runs round the sanctuary bay and the apse, but is wanting in the bays of the choir, nave and transepts. This carries, in black mosaic letters on a gold ground, the words "Alleluia, Sanctus, Sanctus, Sanctus, Alleluia." The division of this band into sections by the projecting friezes of the pilasters and the large size necessary for the letters have made it impossible to use the whole of the passage in Revelation iv. 8 or the passage in Revelation iv. 11. At St. Peter's in Rome the letters of the inscription are carried on to the projecting friezes of the pilasters, but it was thought that the effect there was not on the whole good.

It may be remarked that though the stonework has of course had to be cut away to a depth of about three-quarters of an inch wherever mosaic is laid on the Portland stone, the mosaic brings the surface in all cases exactly to the original plane. There has in no case been any tampering with the contours or mouldings of Sir Christopher Wren, though in several cases a freer field would have suited the mosaic better. The panels in the roof of the apse and the saucer dome and pendentives in the choir bay were all laid by Wren with red bricks of very fine make, forming an admirable surface for the reception of mosaic.

The windows of the upper tier in the apse come in the midst of mosaic, and special treatment of them was necessary. The colours must harmonise with the colours of the mosaic, and while the windows must look bright they must not dazzle the eye which seeks to see the designs in the panels. More will be said on this when we come to the clerestory windows of the choir. For the present it is enough to say that the subject of the windows is taken from the same chapter (iv.) of the Revelation, the four-and-twenty Elders with their golden crowns, eight in each window. At the head of the north and south windows is a circular crown, containing emblems of the Evangelists, St. John and St. Luke, on the north. These are surrounded by a ring of twelve cherubs. Below are three Elders, with two angels with purple wings; below that again five Elders, and at the foot five angels with ruby wings, carrying censers. In the central window the Archangel Michael stands at the head, the arrangement of the other parts of the window being the same as in the side windows. The decoration of the dresses will show how careful the work is, but details on that scale can only under exceptional circumstances be analysed from the

* A description prepared by the Rev. Canon Browne.

floor of the church. It is hoped that arrangements may eventually be made to enable small parties of visitors to stand in safety on the cornice in different parts of the church for the purpose of closer inspection. The full-sized cartoons for these windows and for the two clerestory windows were made by Mr. Richmond, and the work was carried out by Messrs. Powell under his supervision.

In the original sanctuary bay there are two large rectangular panels on each side, above the square openings for the gates. The elongated form of the upper of these, which correspond to the dark storey or triforium of a Gothic church, naturally suggested something of the nature of a procession, or a row of figures. The subject adopted is the sea giving up its dead (Revelation xx. 13), still in connection with the subject of the apse roof. The lower panels lend themselves better to groups of figures. The subjects are, south, the Sacrifice offered by Noah (Genesis viii. 20-22), and north, the Blessing of Abram by Melchizedek (Genesis xiv. 18-20). The borders of these panels are very rich, representing the fruits of the earth. It will be seen that they are in character with the beautiful wood-carvings of Gibbons on the frieze above the choir stalls and with the stone sculptures in relief in many parts of the church.

The Portland stone of the fluted pilasters in the apse and on the east side of the sanctuary bay has been replaced by rich green serpentine. The reredos in the apse, from the design of Messrs. Bodley & Garner, with a copy from the Cima in the National Gallery of the Doubting of St. Thomas, has been erected by the Liddon Memorial Committee. The committee have also placed here the recumbent monument of Dr. Liddon, for twenty years canon of the cathedral; it is a noble work, by Messrs. Farmer & Brindley, from designs by Messrs. Bodley & Garner. The three windows are by Mr. C. E. Kempe. The east side of the large reredos is to be polished and decorated, and the brazen doors in the reredos are to be decorated on this side. The walls and pavement are to be restored. When the whole is complete, this is to be called the Jesus Chapel, and is to be used on some special occasions.

We now come to the easternmost bay of the choir. This offers nineteen spaces for mosaic treatment; and of these eleven are completed, including all the largest. In the spandrels of the arch on the north side two angels are placed, reclining on the battlements of Heaven, guarding the instruments of the Passion; the angel to the east has the spear, the other has the nails on a golden disc. In the centre is a source of light, with the words "Gloria in Excelsis, Glory in the Highest." The figures convey the sense of watchful repose. When there is a fair light the coruscation due to the varying angles at which the golden tesserae are set is a great beauty; this is usually best seen from the extreme south-west corner of the choir aisle.

This was the first work done from Mr. Richmond's designs, and it was taken as a test of the fitness of his methods. It will be an interesting study, for ages to come, to pass from one part of St. Paul's to another, beginning at this point, and note the gradual growth of the English School thus inaugurated. The growth in three years is in itself remarkable. The spandrels on the south side will carry two angels with other instruments of the Passion. The Portland stone of the pilasters has been replaced by Pavonazzo marble, specially selected to harmonise at once with the mosaic and with the marble of the reredos. It will be seen that there is still much to be done with the capitals of the pilasters and some of the stone surfaces.

Passing to the space above, where the triforium openings would come in a Gothic church, three rectangular panels present themselves on each side. These are for the present left untouched. They will be occupied by groups of a processional character; but it is intended that the great procession shall be reserved for the north and south halves of the drum of the dome.

From this point to the top of the roof all is finished on both sides. It is better to mention first the saucer dome at the top, for it was the second piece of work done, and the chronological order is important. It represents the creation of the birds. In the centre is the inscription "et volatile sub firmamento," and fowl in the open firmament (Genesis i. 20). Round this is a ring of small birds; then a larger circle of golden eagles with outstretched wings, the tips of their wings almost touching. Then, still further from the centre come the beginnings of the clouds and the tops of the mountains and trees; and finally, near and at the border, the ground, with water here and there. The beauty of the birds collected at this part of the dome is very great, peacocks, turkeys, cranes, swans and so on. One of the finest peacocks may be seen a little to the east of south. The fruit and flowers of the trees and the magnificent lilies towards the east are very striking. In a modest little square on the circumference, at the south-west, is the date, "A.D. 1892."

It has from the first been a question whether the tone of this large area is sufficiently bright, and there will no doubt continue to be two opinions on the subject. To fill the saucer domes with subjects so clearly defined that they explain them-

selves without any effort on the part of the spectator would have the effect of lessening the height of the roof. On the other hand, as the light can never fall nearly normally on this part of the mosaic, colours that require full light to make them look bright are not suitable. The light in London is not like that in Rome, and that fact of itself imposes limitations on the use of colour. All these points, and others more subtle, the artist has carefully considered. But no doubt the study of the general effect at different times of the day and year when the scaffolding is removed and the full play of reflected light from the pavement and elsewhere falls upon the dome will settle the question, and the experience will not be neglected when the other saucer domes come in turn to be treated.

The four pendentives to the saucer dome offer the most conspicuous surfaces in the church for mosaic subjects, but their form limits strictly the choice of subject. Each is occupied by an angel bringing a message from heaven in the attitude of being on the point of alighting on the earth. The extended arms have the incidental effect of supporting the great ring of sculpture round the saucer dome. On the pendentive to the north-east is the inscription, "Populus qui ambulabat in tenebris vidit lucem magnam" ("The people who walked in darkness have seen a great light," Isaiah ix. 2). On the north-west, "Parvulus enim natus est nobis, filius datus est nobis" ("Unto us a child is born; unto us a son is given," Isaiah ix. 6). On the south-east, "Factus est principatus super humerum eius" ("The government shall be upon his shoulder," Isaiah ix. 6). On the south-west, "Vocabitur nomen eius admirabilis" ("His name shall be called Wonderful," Isaiah ix. 6).

The splendour of mosaic work and the brilliancy of the old method is nowhere more clearly shown than in the four great spaces by the sides of the clerestory windows. The north side of the choir is to represent the ancient world looking dimly forward into the future, with no limitation to the Old Testament. Beginning at the north, the figure to the east is the Delphic sibyl, with the word "Delphica." The revelation is represented as brought by a wingless human figure. To the west is the Persian sibyl, Persica, with three winged figures bringing the revelation. All the details of the robes of the sibyls and of the architectural and other features of the composition are exceedingly rich. The effect produced by the intentional roughness and irregularities of the setting of the tesserae and the variations of the angle at which they are set is very striking, whether the spectator is close at hand or far off. Below the window are the inscriptions, "O Sapientia, veni ad docendum nos, O Oriens, splendor veni et illumina nos" ("O Wisdom, come and teach us, O splendour of the East, come and enlighten us"). These are portions of ancient antiphons to the Magnificat for December 16 and 20.

The south side is to represent the Temple builders. The figure to the east is David, with the harp; that to the west, Solomon, seated on the lion throne. The difference between the simplicity of David's dress and the magnificence of Solomon's should be noticed. Here, too, as in the case of the sibyls, the skill with which the artist has made his design fit the great raised scrolls of Sir Christopher Wren on each side of the window should be observed. The inscriptions below the window on this side are, "O Radix Jesse, veni ad liberandum nos, O Clavis David, veni et educ vinctum" ("O Root of Jesse [Isaiah xi. 10], come and release us, O Key of David [Isaiah xxii. 22], come and set the captive free"). These are portions of ancient antiphons to the Magnificat for December 18 and 19.

The clerestory windows themselves are specially designed by Mr. Richmond with a view to the circumstances. Something was said of this in connection with the apse; but the circumstances here are very different, and the treatment is as different as well could be. The intention of the large amount of lead employed is to close up the window as much as possible when seen in profile, as it were, from some little distance to the east or west, or from below. The eye of the spectator in such a position can rest on the mosaic at the side without being dazzled by the window, while yet the light is passing through in full force to illuminate the mosaics on the other side of the choir. For this purpose a maze of continuous flowing pattern was required, and Mr. Richmond has found what he wanted in the surface decorations of the seventh and two or three following centuries, examples being found in various parts of England dating long before the Norman Conquest. The main part of each window is occupied by spiral tendrils springing symmetrically from a central stem, each tendril containing an angel. This is, of course, a well-known pattern. It is found on an Anglian stone at Jedburgh, sculptured when Jedburgh was still part of Northumbria; the spiral branches there are occupied by squirrels and other creatures nibbling the buds. The angels in the tendrils are variously occupied: some are armed, and using their arms; some carry shields, with Fortitudo, Prudentia, Justitia, &c.; some are engaged in agricultural pursuits. The north window was put up first. It will be seen that the window on the south shows a greater warmth of colour, the wings of the angels

being very beautiful. Throughout these windows the pattern is formed by the lead.

The borders of the windows are taken from several sources. On the north, the border at the top is copied from pre-Norman decoration in stone at Britford Church, near Salisbury, as also are the two corner pieces at the bottom. The patterns up the sides are found in England, Scotland, Ireland and Lombardy; for instance, at Rothley Temple (Leicestershire), St. Vigean's, near Arbroath, the Romanesque church of St. Abbondio at Como, and in the Cassiodorus MS. at Durham of Bede's time. The pattern at the bottom is composite. On the south side, the birds in scrolls at the top are of a type found in pre-Norman England, notably at Bewcastle and Ruthwell; in the ivory chair of Maximianus at the Duomo at Ravenna; at St. Abbondio at Como, &c. The pattern up the sides is distinctly non-Anglian, so far as the doubling back of the band between the systems of circles, a feature never found in the early work of these islands. It is wrought in stone as a border round the east window of the main south aisle of St. Abbondio, and from its condition there it may be assumed that it is a portion of the decoration saved from the original church of the seventh century, when the present noble church was built in the eleventh. Without the feature of doubling back, this pattern is found very frequently in early work in England, Scotland and Ireland, both in stone and on parchment. A fine example has lately been found as far south as Wantage. The pattern at the bottom, consisting of "Stafford knots," is one of the most usual of the patterns in early Anglian work. As used here, with rosettes inserted, it closely resembles some white marble screens in the ancient cathedral of St. Lucius at Coire, probably preserved from the still earlier church. The border of the north and south windows in the apse is Celtic, a triangular meander.

Inscriptions will be seen on the sides of the stone ribs of the roof on each side of the saucer dome. On the side facing westward "Omnes volucres celi" ("O ye fowls of the air"), words from the Song of the Three Children, indicating that the subject of the mosaic in the saucer dome is the creation of the birds. The second saucer dome is to show the creation of the fishes, and the west side of the next rib will carry the words, "Omnia quæ moventur in aquis" ("All that move in the waters"). The easternmost of the saucer domes will show the creation of the beasts, with the words "Omnes bestię et pecora" ("O all ye beasts and cattle"). Lastly, on the west face of the rib on the west side of this third saucer dome will be the words, "Benedicite Omnia Opera Domini Domino" ("O all ye works of the Lord, bless ye the Lord").

Turning now to the eastward sides of these four ribs, two of which are completed and carry respectively the words "conspiciuntur" and the words "sempiterna eius virtus et divinitas," the intention is to place on the four ribs the verse Romans i. 20, arranged in the following order, beginning at the entrance to the choir:—1. "Invisibilia eius a creatura mundi" ("The invisible things of Him from the creation of the world"), 2. "Per ea quæ facta sunt intellecta" ("being understood by the things that are made"), 3. "Conspiciuntur" ("are clearly seen"); 4. (directly facing the Majesty) "Sempiterna eius virtus et divinitas" ("His eternal power and Godhead").

The pattern on the sides of the stone ribs has been designed for the purpose of giving breadth to the surface, which in itself seemed too narrow to carry letters of sufficient size. It is only one foot broad. The fact that the gold ground of the mosaic in the roof is brought close up to the edge of the band also gives it breadth, the characteristic of gold being that two surfaces meeting at an obtuse angle seem at a distance to be in one plane. This effect can be seen well near the word "conspiciuntur."

Some facts about the areas covered and the amount of glass used may be interesting.

The saucer dome contains 532 square feet, and each pendentive 140; this gives a total of 1,092 square feet. The number of glass tesserae used for this area is about 1,100,000, and their weight about a ton and three-quarters. The mastic cement in which they are laid is a very careful composition, with ingredients which cause it to set like stone. It is made of the same red colour throughout, so that wherever it shows between the tesserae—and that is very frequently, in the bold method used here—it produces one and the same effect. The weight of the cement in which the tesserae of the saucer dome and pendentives are laid is two tons. The whole area so far covered, not reckoning the six panels and two spandrels which are left untouched in the choir bay, is about 3,255 square feet. This means about 3,300,000 tesserae, weighing over five tons, and six tons of cement.

About one hundred and fifty different tints of glass are in use for the tesserae. The number at first was considerably larger than that; indeed, it still is practically larger, for one sheet of glass containing crackled gold, when cut up into pieces, gives tesserae differing considerably from one another in tone.

It may be well to add a word as to the manner of setting the tesserae in the cement so as to produce the design. A full-sized cartoon is drawn by the artist, fully coloured. A tracing is taken of this with charcoal on tracing-paper, the lines of colouring of the design being carefully followed. This tracing is then laid in the proper place on the surface of the cement, or if the design is too large for that, the cartoon and the tracing-paper are cut into pieces of convenient size, and one piece is dealt with at a time. The mosaic worker pricks through the tracing-paper into the cement with a bradawl, following, say, a line of black colouring. He then folds back that portion of the tracing paper, and referring with his eye to the coloured cartoon from which the tracing was taken, which hangs near him or lies at his feet, he inserts tesserae of the proper colour along the lines marked by the bradawl. The part of the tracing-paper folded back is then turned on to the surface of the cement again, and another line of colour is marked with the bradawl; and so on. It will be seen that in this process the mosaic worker is using his intelligence actively the whole time. He has besides to decide, as he goes on, many questions; as, for instance, the size of tesserae to use when he is working on a vanishing line of colour; the amount of irregularity with which the edge of each shall be set in relation to the neighbouring edge; the amount of cement he will show between two tesserae; and the amount of departure from the normal which he will allow in places where brilliancy is to be produced by setting the tesserae at varying angles, so as to provide facets on which the light from many quarters may be reflected to the eye. This is very different from the purely mechanical work done in England when the mosaics are made in Italy. In that case the tesserae are all cut and placed in design in the foreign studio, and sent to England in sheets. The tesserae are merely taken up one by one by workmen here, and put into the cement on the wall each in the place assigned to it.

A rough estimate can be formed of the amount of mosaic required if (1) the three bays of the nave, the bay in each of the transepts, the two remaining bays of the choir; (2) the four bays opening out of the dome; (3) the concaves and galleries in the dome, and the drum of the dome; (4) the great saucer dome at the entrance to the nave and other suitable surfaces there, are all treated as the eastern bay of the choir and the sanctuary bay have been treated.

(1) Each of the seven bays will require rather more than 2,050 square feet of mosaic, about 14,500 square feet in all.

(2) In the transepts the lower panels of these bays are occupied by sculpture. In the choir they are hidden by the organ. In the nave they are free. Leaving all these out of consideration, and counting only the long rectangular panel and two piers above the cornice in each case, these eight panels and sixteen piers contain about 600 square feet.

(3) The four concaves and portions of the roof of the four galleries may be put in all at about 1,600 square feet; and a band of mosaic ten feet broad (half the height of the drum) running round the dome above the whispering gallery will contain about 3,500 square feet.

(4) The great saucer dome gives an area of about 1,520 square feet. The amount of mosaic required for this part of the church may be put at something more than 2,000 square feet.

These amounts, with the 3,255 square feet already done, give a total of about 26,000 square feet. If that is a correct estimate, about seven-eighths of the work still remains to be done. If the decoration committee had the necessary funds at its disposal, the work might be completed in fourteen years from the present time.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair. Messrs. F. B. Dunkerley and H. L. Anderson were elected members.

Mr. S. B. BEALE read a paper entitled

Colour in Street Architecture.

Mr. Beale said:—In introducing the subject of "Colour in London Street Architecture" for discussion this evening, I am aware of the initial difficulty of saying much that shall be both new and original. I hope, however, to show some justification by emphasising the importance of good colouring, by rapidly noting some of the colour effects to be seen in building materials of long standing, and then (for I think the time has arrived when we may profitably do so) to review some of the colour effects produced by the use of one or two materials of modern introduction, with the object of discovering, if possible, how far the promises of twenty years ago have been fulfilled by performance.

Colour in architecture appears to me to hold a position in importance possibly second to composition, but certainly before detail. It is unsafe to definitely say that colour is of second importance, for the composition of a front may be good,

but bad colouring will ruin it. Also, a building well massed and good in colour is successful, independently of its composition. The reason I have for placing colour tentatively second to composition is in view of the case in which the massing and composition of a building are both bad—then, neither colour nor anything else will save it.

Utility and artistic treatment in planning, composition and detail, are now brought to a high state of perfection, while colour, the one feature that appeals to all, remains stationary and unsuccessful. In London it is a hundred years behind its co-factors in good architecture, and will remain there so long as detail is treated as the more important of the two.

For mere professional credit's sake it is important that our buildings should be invested with good colouring, but if a stronger argument is needed to show the necessity, it lies in the effect of colour on the eyes, the dispositions and the health of the citizens. Nine persons out of ten receive an impression from the architecture they pass in the street; sometimes it is the form, more frequently it is the colour, that produces it. Form is the first seen, colour is the last forgotten.

Ours is not a cheerful city in point of architectural tints, and yet, in the main, it is what architects have made it—evolved from indifference rather than from design. A sunless sky and a murky atmosphere may accomplish a great deal in the depression of human spirits; the effect, however, is small compared with the amount of work done by the dismal walls of architectural colour that line our thoroughfares in all directions. The atmospheric outlook is made the scapegoat when our spirits are at zero, but it should be remembered that a cloudy firmament, though perhaps poor in colour, is usually rich in form, while the colours in the handiwork of man frequently have nothing to mitigate them. In this age of hard work, close reading and sedentary occupations, the contemplation of scenery, light and colour is the recreation of the eye, and the walk along the street is the main opportunity for it. If, then, the field over which the eye wanders is nothing but blackness and gloom, the eyesight of millions must be deteriorated by the want of colour in their surroundings. We must all have felt the gentle cheerfulness that comes on beholding good harmonious colouring, and who can deny its powerful influence in producing the bright and open disposition of the countryman, dwelling in the midst of nature's colour wealth, or in fostering the hopeless despondency of the town man surrounded by eternal gloom?

Colour, too, affects the health in many ways. It is reported on good authority that medical men appreciate this fact, and in certain cases prescribe a scheme of colour decoration for the interior of their patients' rooms instead of physic for another interior. However this may be, it is certain that colour surroundings have very material physical effects on mankind.

The principles of good colouring are few and definite enough, but individual taste is dependent upon individual feeling and sentiment. White is perhaps the best and purest medium for architectural expression, but the surroundings essential to its existence are a sunny clime, a pure atmosphere, and brilliant patches of colour to give relief. These are accessories not known in London. White, as it is to be seen pleasantly weathered in masonry and plaster-work on the Continent, does not and cannot exist as a medium for architectural expression in the materials now used in this Metropolis. In name our colours range from white to grey, yellow to red, rising in the streets with total disregard to the harmony or contrast of adjoining premises. The effect, good or bad, is, however, of little moment at the time, for a grim spectre spreads its sooty mantle on all alike, reducing them to harmonious obscurity. Some of the reds proclaim their identity in the fitful gleams of sunshine, but the whites, greys and yellows maintain a strict incognito after a few years' investiture. There is not a thoroughfare in the whole City of London, nor half a dozen in the four-mile radius that one would choose to walk down on account of the pleasure derived from the outing. In some of the materials the self-colour is bad to begin with, in others the colours are good but badly disposed; in many instances a visible coating of dust and soot obliterates the tints, but in the majority of cases the materials soaking up the grime have weathered black. Queen Victoria Street, in the City, and Victoria Street, Westminster, are fine fields for study in any of these effects. London's colour does not compare favourably with that of many continental cities.

Anyone who saw the exhibition of Mr. Rimington's drawings of Spanish towns, for instance, after making due allowance for idealistic treatment, must agree that ours is a colourless city compared with the brightness of many on the Continent.

Having come to the conclusion, after long observation, that the colour of London street architecture is dismally bad, I will endeavour to differentiate between the cause of and the responsibility for the same.

The final cause is the work of many contributory factors, the chief of the offenders being that insidious demon, the town atmosphere, aided by narrow thoroughfares and high buildings, but even these agents would have but little effect in obliterating

colour were it not for the position of London in the sunless valley of the Thames. These, then, are the immediate agents acting on impressionable materials. So far, it is just and right to say the climate and dreadful atmosphere are the causes of the gloom that surrounds us architecturally, but when we go a step further and find that the materials used by architects are particularly susceptible to these influences, and that architects know them to be so, and are perfectly well aware of all the drawbacks to the maintenance of good and cheerful colouring, then I think, in continuing to use these materials, as a profession we alone are responsible for the gloom in which the Metropolis is wrapped from end to end.

Before attempting to inquire in what direction improvement may be looked for, it will be instructive to notice the evolution of colour in some materials under the effects of a town atmosphere.

Stock brickwork, beginning life in a suit of bright yellowish ochre, is lowered after a few years by the solution of rain and soot on its surface to a brownish-grey. A few more seasons eliminate the brown, producing a blackish grey in fair weather, slaty grey in a strong light, and absolute uncompromising black in shadow or wet weather. In such colours Great George Street, Gower Street, Whitehall Place and other stock brick thoroughfares are rich. This work appears to have no weathering qualities whatever, the nature of the material not permitting them. Dust, rain and soot are soaked up uniformly over the surface, wind and other weathering agents making no variety in the tones. Of all the colours to be seen in London street architecture stock brickwork, in whatever aspect, produces the most hopeless and depressing, and there is only one merit that saves it from provoking all the anathemas of Ingoldsby's Lord Cardinal, and that merit is the possession of a powerful contrasting effect on any bit of colour that happens to be planted in its midst.

Yellow malms in London appear to voluntarily shed their colour independently of the action of the atmosphere, the surface becoming even in favourable positions an ashy grey.

Of the many kinds of red brick in use there are really very few of an artistic tone. Great improvements are made from time to time in the manufacture and burning, but the truer the brick in shape and the harder it is in texture, the duller and more lifeless the colour becomes. The Ellistown bricks, now largely used, possess several practical advantages, but in colour do not satisfy the critical eye. A nice piece of work has been executed in Fareham red bricks in the new Admiralty extension, a tender surface relief being produced by using haphazard bricks of slightly varying depth of colour tone. The aspect and position of this work promise well for weathered effect provided the rain washings from the contiguous stone do not play their usual tricks with the front. It must be admitted that the majority of brick buildings, when newly erected, are certainly bright, and in many instances good in colour. The red examples in Fleet Street by St. Dunstan's Church were brilliant when drawn a few months ago. Twelve months hence they will have sobered into respectability, and then the grimy zephyrs of Fleet Street, year by year adding one more fold of the dreaded shroud, will finally wrap them into obscurity. The ideal tone for red brickwork is purely dependent upon individual taste, but I will express the opinion that, given favourable conditions of site and aspect, a front built of bricks with a virgin surface of colour approaching the lightness of tint possessed by rubbed work would produce a more pleasing effect than the heavy reds in general use.

Of all materials, red rubbed brickwork properly designed on an open site with a western aspect is capable of showing the most beautiful weathered effects; but in few instances of its use has it been properly managed, or are the conditions favourable. As to the management of the material, the use of limestone in cornices, copings or projecting strings in conjunction with rubbed brickwork is disastrous, as, even with a good aspect, the effects produced are more striking than beautiful. A chemical, or, it may be, an electrical action is set up by the atmospheric impurities, washing from the freestone on to the rubbed brickwork, blackens it, and forms a crust of disintegrated material. This crust then voluntarily wears off.

It is curious, however, to notice that rubbed brickwork immediately below a flush freestone band, except when contiguous to the ground line, is not damaged in the manner just described, but becomes nicely toned with age, tending to prove that even the contiguity of limestone is not prejudicial so long as wind and rain are allowed free action on the surface. The Alliance Assurance Office, at the corner of Pall Mall and St. James's Street, built in red brick, partly rubbed, and stone dressings, is, as would be expected from Mr. Norman Shaw, everything that could be wished in mass, composition and detail. The colour effect after some ten years' existence is unfortunately far from pleasing. In this instance the western front has become more enveloped in grime than the southern front. The incrustation of dirt on sheltered and recessed parts, and on the ornamental frieze, has seriously obliterated the original colour, while the overflow from the stone dressings of icicle-shaped pattern in a

sooty lime medium are very unsightly on the red brick surface. A small portion of the fronts above the principal cornice, together with a few square feet on the angle turret where the elements have had full play, exhibit a charming effect, giving promise of what might have been under other circumstances.

All brick treatments seem to require a good self-colour to begin life in our streets with, for bricks do not weather after erection in the same manner as the separate blocks in a stone front may be expected to do. Aspect also appears to make much less difference to the coloured effect of brickwork than it does to stone.

Of the two varieties of Portland stone so much favoured in London, the white is with difficulty prevented from turning black, and the brown a tone only one degree less dreary. There are a few examples of nice delicate weathering in this material to be seen, the position usually being the exposed part of the return flanks of high buildings above the roofs of lower ones. The Criterion Restaurant exhibits a small specimen. This piece of masonry receiving the full force of the west wind and rain driving unobstructed from the direction of Piccadilly has assumed a very tender weathered effect, in spite of the closeness of a batch of smoky chimneys.

The west but not the south front of the Duke of Buccleuch's house in Whitehall Gardens is an instance of clean weathering in stone, the effect being due probably as much to the proximity of some large trees as to aspect and free exposure.

It is difficult to explain all the colour effects seen in London stonework. The whiteness of balustrades and attic storeys, also the piebald effect on many columns, may be accounted for, but the causes of some other effects to be seen, it passes the wit of man to discover. For instance, in contrast to the pleasant appearance of the Duke of Buccleuch's west front stands the Board of Trade office, a few yards away, with the same aspect, but covered with a visible coating of coal-black grime which the difference in age does not account for. I cannot explain the weathered angle of the National Liberal Club, a comparatively new building, as illustrated on the screen.

Of the few coloured stones used in the Metropolis Ham Hill has received some attention lately. As a contrast to other colours, the bright ochery tint is a relief, and I look forward with interest to the time when the weathered effect of the new Travellers' Club may be examined. The position of this club is very favourable for the development of tender weathered tones, but yellow of any kind is at best not a permanent colour in building material.

Daly's Theatre in this stone is losing the coarseness that was apparent at first, but there is little hope that any colour whatever will be discernible after a few years of the atmosphere of Leicester Square.

Probably there are many Ham Hill stone fronts of longer existence than those mentioned, but it is not possible to recognise them in their present garb. I now turn to a stone which stands town environment admirably, and weathers to nice tones. Red Corsehill has been sparingly used in street fronts, considering the marked indifference it shows to the attacks of the sulphur-laden atmosphere. A very good example may be seen in the front of Messrs. Tooth's Art Gallery in the Haymarket, by Messrs. Archer & Green. There are no accretions of grime on the work, each stone is marked by tender variations of tone, no unpleasant stains mar the general effect, and from all points of view this front of Corsehill is a pleasing bit of colour in the midst of a wilderness, bright and fresh after ten years' existence in the Haymarket. Corsehill stone also possesses the advantage of being more colour-some in wet than in fine weather.

Red and grey granites have good natural colours which, however, are subject to the same obliteration in street architecture as the tints of humbler materials. If unpolished granite when used in plinth bases could always be given an inclination from the vertical, the colour would longer remain visible, and a clean effect be obtained. The introduction of polished granites in the small panels of stone fronts fails to give the colour relief desired, for even the shallow recess of a sunk panel affords sufficient shelter to allow of the formation of an opaque film which obliterates the tints.

Granites under conditions which unfortunately will never occur would be absolutely the best materials in point of colour, durability and imperviousness for the exteriors of London street architecture, polished parts for relief being used as dressings. But this is the dream of an Utopian age, when the coin of the realm shall no longer hold sway in human concerns.

Of all building materials black marble stands pre-eminently first in point of beauty. A London street front, however, is not the place for it, except under very propitious circumstances. Colonel Edis, with great courage, has freely used it in the front of the new Junior Constitutional Club. Its position, an open one, good in aspect, and with plenty of leafy trees near to absorb impurities, is eminently favourable. It will, therefore, be interesting to note how the material has weathered at the end of a few years. The pureness of the colour will depend

upon the preservation of the surface; if this is soon destroyed terra-cotta manufacturers will breathe again. It is to be devoutly hoped that the club will retain in the years to come its pristine purity of tone. At present it certainly realises all that could be desired in architectural colour effect.

The use of metals for the purposes of decoration in street fronts is evidence that there is a desire to brighten things up a little. Experiment in this direction is risky, however. The large metal caps and bands on the marble pilasters to the front of the Tivoli Music Hall were very bright and striking once, but—they are another colour now.

In viewing the chiaroscuro of the London streets, compo and plaster-work cannot be ignored. In the light of architectural knowledge in the last decade of this century, compo is a most unarchitectural material. The marked prevalence of it in the well-to-do quarters of the town, executed, I suppose, some forty or fifty years ago, exhibits the marvellous strides architecture has made since that time. The acres and acres of compo-work in the north-west of London, in and around the whole of the Regent's Park district, and brought right into the centre of civilisation by that graceful artery Regent Street, shows very plainly that this material was in great favour at one time and used by men who undoubtedly possessed a keen appreciation of the value of breadth of treatment and boldness of detail, but who troubled not about colour. What the effect would be if the natural colour of all this compo-work could be seen is not pleasant to imagine. The tints that meet the eye range from a warm stone to mahogany colour, both ground in oil.

The milk-white effects that enter so largely into the colouring of continental towns and cities exist mainly in plaster-work. Modern London contains few specimens of such, a fact that I do not think is to be regretted, as such effects are usually coupled with bad building.

The consideration of plaster and compo-work naturally leads on to the subject of colour put on with a paint brush, and I must confess to a feeling of uneasiness in dealing with it. On the one hand, one knows what Regent Street, for instance, and the many miles of suburban architecture would be like without the four coats of common colour, Bath stone even in many cases owing its continued existence in a London atmosphere to the protective agency of white lead and oil. On the other hand, it appears to be the lowest depth of technical immorality to cover the externals of architecture with a coat of paint. In endeavouring to justify its use, one is led away by the seductive appearance of the nice, clean, stone-colour effect on a fine spring morning, when the cradle has been lowered. It is such a vivid reminder of what the colour of honest building materials might be in brightness and tone. As practical men, I suppose we must endure it as a necessary evil, but, as artists, avoid it like a plague. The greatest bar to its favourable consideration no doubt lies in the abuse of the medium. Tints ranging from salmon pink to navy blue on street fronts do not add to the artistic colouring of London street architecture. The only safe course then, perhaps, is to forswear the use or any building material that is ever likely to stand in need of a coat of paint.

There is one important material yet to be dealt with, and as the colour effect of terra-cotta formed originally the central *motif* of this paper, it would appear desirable to say something about it, although criticism on the subject, like the material itself, is very nearly done to death. When terra-cotta first came into general use it was thought that at last a material had been found which would revolutionise the colour effect of the old materials, and open up a brighter prospect for the jaded Londoner. This material has now had at least fifteen years' experience. We are, therefore, in a position to review how far results to-day agree with the original promises.

(To be continued.)

A NEW PALACE IN VENICE.

AN occasional correspondent of the *Scotsman* gives the following account of a Gothic palace which has been erected on the Grand Canal:—

Four hundred years have passed away since the last Gothic palace was erected in Venice, and one hundred and fifty since a palace of any kind was constructed. Not only that, but during these past centuries, whilst little or nothing was erected, hundreds of palaces were destroyed. Since the time of Napoleon alone it is calculated that between two and three hundred palaces, in all kinds of styles of architecture, have been demolished. Now, happily, all that is ceasing. The last twenty or thirty years has been a period of conservation and of restoration. Property has doubled in value during that period. A palace on the Grand Canal that could have been bought in 1850 for from eight hundred to a thousand pounds now costs two. Old tumble-down buildings have been made to "look as good as new." This property restoration throughout Venice has been chiefly the work of Jews. They are the richest

merchants in the city, and at the head of the chief business houses. These buy up old houses at a small figure, put them in good order, and let them at rather high rents. The saying is common in Venice that wherever you see a house nicely done up you may be sure that it belongs to a Jew. The other great restorer of property is the Italian Government. As all ecclesiastical property belongs now to the Government, and many churches and similar buildings have been registered national monuments, the State charges itself with their maintenance. This has necessitated much expenditure in the way of restoration. Fifty thousand francs (2,000*l.*) are spent annually upon the conservation and restoration of St. Mark's Church alone. And upon the whole the restorations, whether effected by private citizens, by the Government, or by public corporations, are done in good taste.

To a period of conservation and restoration is now being added one of construction. A lovely Gothic palace in pure style has just been erected on the Grand Canal, opposite the Grand Hotel and near the well-known church of the Madonna della Salute. It is a large palace, for it covers an area of about 1,000 square yards, has a frontage to the Grand Canal of 118 feet, and has cost about 400,000 francs (16,000*l.*). It is true that there is nothing original in its construction and architectural style. But it is something to be able to say that there is nothing base, nothing of the low decadence, nor even of the Renaissance period about it. It is pure Gothic, copied from the best fourteenth-century specimens of that style to be found in Venice. It is approached by a broad flight of steps that dip into the canal, is entered by three large Gothic arches, above which, in its first and second floors, are great Gothic windows of six lights each, divided by handsome marble columns with richly-carved capitals, with foliated lights above them. Other twenty-four windows, arranged in groups to right and left of these beautify the rest of the façade. The angles of the walls and the roof cornice are relieved and adorned by the old Venetian cable and dog-tooth decorations. Balconies with light graceful columns set off still further the beauty of the *piana nobile*, or first floor. It is a palace that even Mr. Ruskin could praise. The whole is the workmanship of Venetians, and reflects much credit on the architect, sculptor, and the able capo-mastro, and indeed on all concerned. Of the workmen I want to say one word. As the columns were fashioned and the capitals carved in a place near to where I lived, I often used to talk to the men, who all day long were there singing at their work. They had long hours, working in the summer from five o'clock till seven, with an interval of from two to three hours in the middle of the day for food and a *siesta*, and they had what we should consider small pay, from two to four francs a day (1*s.* 7*d.* to 3*s.* 2*d.*), yet they were happy and contented, and took a real interest and pride in their work. "The palace will be an honour to Venice," they used to say, "and, you see, we can still do the good sculpture our forefathers did."

There is one drawback to the palace, and that is that whilst beautiful in itself, its position is such that it rather spoils the view of the Grand Canal on the side where it stands. Formerly the height of the houses gradually diminished, and showed towering over them the domes and pinnacles of the great Salute Church; now this palace breaks the symmetry and cuts off the view of the Salute to a large extent.

Visitors to Venice are always interested in the foundations of its houses. How these are formed to support massive buildings rising out of the water is a puzzle. As I saw the foundations of this palace laid, perhaps I may be allowed briefly to describe the process. First, a strong cofferdam was constructed to keep out the water of the canals. Next, into the bottom thus laid bare were driven wooden piles. The work of driving these is one of the unique sights of Venice. Strong men raise with their arms a heavy hammer that slides on an upright beam, and let it fall on the top of the pile. The leader of the gang meantime keeps singing an old Venetian song, to the music of which the hammer is raised and allowed to fall. The work is very deliberate, as two whole lines are sung whilst the hammer is in the air, and other two before it is raised after it has fallen. It looks to be very slow work, but the men continue thus at it many hours without fatigue. The piles used in this case were beams of oak from 12 to 14 feet long, and a little less than 3 feet in circumference. Of these 3,000 were used, which were driven, not close together, but leaving irregular intervals between them. Then into these interstices was poured a mixture of cement and stones and water, which formed a mass, solid as stone, in the course of twenty-four hours. The palace is 70 feet high, and the width of this foundation was 9 feet. On this, to the height of 6 feet or so above the level of high water in the Grand Canal, was raised a massive wall of Istrian stone, gradually diminishing in width. Above this were raised the walls, which are of brick, dipped in a solution the invention of the capo-mastro, Signor Marco Torres, which makes them resist damp and the weather. These brick walls also taper gradually, until at the top they have a width of only 1½ feet. The whole façade thus becomes to a certain extent a great buttress. In the construction of the old palaces no

cement was used, but the piles were driven in one close to another. Had this old method been pursued in this case, instead of 3,000, 15,000 piles would have been used. The church of the Madonna della Salute adjoining stands on not less than one million and a half piles. In the old foundations, too, piles were not of oak, but of poplar, pine and various kinds of wood. Away from air and light they do not readily decay. Whole forests of wood are buried beneath Venice, as every building, with the exception of a few side walls of some, stands on piles. The foundations are the most expensive part of a building in Venice, and in the case of this palace they cost about 65,000 francs (2,400*l.*), those of the façade on the Grand Canal costing 20,000 francs alone (800*l.*). The cost of building space on the Grand Canal is at present about 30 francs (1*l.* 4*s.*) a square yard, but elsewhere in Venice only from 4*s.* to 4*s.* 6*d.* a square yard. Of course there is hardly an inch of clear building ground in Venice (exclusive of garden ground of which there is a very large amount), and as was the case in this building site, inferior or ruined buildings have first of all to be removed. This palace is not yet finished for occupation, and its erection has taken more than a year. I may add that, as in all buildings in Venice, the floors are laid with a kind of concrete peculiar to the city, which consists of cement and marble broken into small pieces, and of different colours. This is afterwards polished and oiled or waxed, when it presents a clear, smooth and solid surface, shining like a mirror, but a little slippery to walk upon. The ceilings are all left unplastered, and show magnificent beams of wood partly carved, from 40 to 60 feet long, cut from the great giant forests of the Dolomite Alps, which are able to supply Venice now, as they have done for hundreds of years back, with timber for her fleets and palaces.

A MANCHESTER MACE.

A DESIGN for a mace, which is to be made for presentation to the Corporation of Manchester, has been prepared by Mr. Walter Crane. According to his description, it is crested with the city crest—the globe and bees. The figure is intended to typify the industrial city of Manchester, and it is enclosed in a letter "M" to make it still further emphatic as the emblem of the Manchester municipality. Below is another globe, symbolical of the world itself. Around it the city motto appears, and the trade of Manchester with all quarters of the earth is symbolised by the beaks of ships (these would be five), the sails of which form the ridges of the mace. Below again, on the bell, are the city shield of arms, alternating with the national arms and emblems. (These might be enamelled in their proper heraldic colours.) Below again is a series of figures under canopies, symbolising the sources of the commonwealth of the city and its prosperity and administration. For instance, one (shown in front) typifies the Ship Canal, pouring a perpetual stream from an urn, which meanders in the form of a ribbon around the stem of the mace to the foot. The other figures may be Labour, Science, Commerce, Liberty, Justice. The fish at the next joint further play on the idea of the connection of Manchester with the ocean, again suggested by the ships sustained by the nereids seated on the sphere which forms the termination of the mace. The mace will be 4 feet long and silver gilt. The subscription rate for the expenses is low in order to enable a large number of the citizens to contribute.

CUBING IN CANADA.*

AN architect often finds it necessary to estimate the cost of a proposed building before more than an outline sketch has been prepared and before specifications have been written.

In such a case he naturally brings to mind a building of the same class which has already been erected, and of which he knows the exact cost. If such a one can be thought of, and if it is of the same general dimensions, he has simply to make allowance for changes that may have taken place in the prices of labour and materials, and has little trouble in arriving at the required estimate. If, however, the building which seems most suitable for the purpose is somewhat larger or smaller than the one proposed, he finds that by taking its cubical bulk or contents and that of the proposed building as a ratio, he may find the proportionate cost with a great deal of certainty, especially if the difference in size is not great. This experience has led to a system, more or less common, of keeping for reference a record of the cost per cubic foot of buildings which have been erected, or upon which tenders have been received, and such a record, although often an imperfect guide, is worth the small amount of trouble required in its preparation, and with the entries made from time to time its value will increase.

* A paper read by Mr. W. R. Gregg at the Annual Convention of the Ontario Association of Architects, and published in the *Canadian Architect*.

Within the past few days I have seen a few of the Toronto architects, and they have kindly compared notes with me upon this subject and contributed some information used in this paper, which is written with the object of leading to a further interchange of ideas in the discussion which should follow.

I would recommend the following simple method of keeping a record of cubic contents and cost, and would say that the information an architect has of this kind from his own buildings is the best for him, as it is probable that no other architect is quite similar in his style of work and finish.

A book or a number of sheets of paper should be ruled in suitable widths for the following columns:—1st, date (year); 2nd, name of building (or owner); 3rd, where erected; 4th, short description; 5th, cubical contents in feet; 6th, cost of building; 7th, cost per cubic foot; 8th, remarks. The kinds of buildings should be classified so that prices of one class may be seen and compared at a glance in one column. Examples were here shown similar to the following:—

[illegible]

In computing the cubical contents the rule most commonly used is to measure the building as a whole or in parts from the bottom of the footings to a point half-way up the slope of roof, this being done in parts where there are different heights of roofs, towers, &c. In measuring brick or stone buildings, light wooden porticoes or verandahs are usually omitted. There should be a uniform system of omitting or including such items as heating, mantels, grates and tiles, electric wiring, or of noting two rates, one omitting and the other including these.

Supposing that cubing our public schools would give nearly uniform results, I saw Mr. C. H. Bishop, the superintendent of Toronto School Buildings, and he kindly made out a list of the cost of twelve buildings recently erected with the rate per cubic foot, and this varied by half and quarter cents all the way from 5 to 7½ cents, the variation not being governed by the number of classrooms. This shows that the system is not perfect and that for very correct results other methods must be used.

I shall close with a list of the most common classes of buildings, giving a price for each per cubic foot, simply as an opinion which may be altered upon further observation. It is intended for Toronto and is probably higher than in other places in Ontario.

Plain stables, brick, not including complete iron fittings	7c.
Plain brick dwellings, detached or semi-detached, pine finish, furnaces and mantels	8c.
Detached brick dwellings with plain stone trimmings, hardwood finish on ground-floor, hot-water heating and mantels	10c.
Detached dwellings, brick or stone, with more elaborate cut stone-work, hardwood finish throughout, best plumbing fixtures, hot water or steam heating, elaborate mantels, electric wiring, &c.	15c.
School houses, brick, including furnace heating	6½c.
Churches, plain brick, furnaces and pews included	7½c.
Churches, stone, steam-heated, including pews and electric wiring	9½c.
Shops, with dwellings over, plain brick	7c.
Foundries or warehouses with earth floor, one storey	3c.
Plain one-storey warehouse, floored	4c.
Wholesale warehouses, five or six storey, brick fronts, with cut stone dressings, heated, office only finished	6½c.
Plain brick office buildings, heated	9½c.
Bank buildings, brick, with cut stone dressings, two fronts (on corner)	20c.
Hospitals, brick, steam heating included	8½c.

Mr. Burke said he was unable to agree with Mr. Gregg's opinion that cubing is not much use, and is rather inclined to be incorrect. He thought in practice it was found to be just as correct as the builder's estimate, and that the very difference in the cubing of schools showed it. Probably the reason for the great margin in the different schools was to be found in the builder's estimates, not in the principle of cubing.

Mr. Bousfield thought another column might with advantage be added to what was already given by Mr. Gregg; that was the cost per head for schools or churches. Hospitals, too, were very often tabulated at so much per bed. All these were important helps for getting at the actual cost of a building, because, as Mr. Gregg had said, every building varies considerably. Hospitals must of necessity vary according to their character, whether for general purposes, for children, or for infectious diseases. All were regulated according to certain

hygienic rules, some requiring more air space than others, and so on. The information that hospitals cost so much per cubic foot gave very little guide to any one else unless it was known what class of hospital it was, and the cost per bed as well as per cubic foot. Then, with regard to bow windows, cupolas and that sort of thing, they were very easily overlooked in estimating by the cubic foot. In carrying out a design such things were frequently added, and they knocked all calculations by the cubic foot on the head, because they were in themselves expensive additions. His experience had been that everything of that kind had to be very carefully calculated.

Mr. Gregg quite agreed with Mr. Bousfield. He thought every oriel window, tower, &c., should be taken. He thought the ideal way of finding the cubic contents was to find out exactly what amount of space taken out of the atmosphere was filled by the building.

Mr. Townsend thought the cubic contents based upon a building of the same sort was far more likely to be right than a builder's estimate. In a case in court not long ago the judge had taken his cubic contents in preference to the builder's estimate. He thought Mr. Gregg's suggestion that architects should confer together on this point a very valuable one, for if they could agree upon some uniform method in their calculations of cubical contents it would be very helpful.

Mr. Jarvis said the class of work an architect did varied so much that the accurate way to find out what your own work would cost was to refer back. Some architects could get work done cheaper than others, who were regarded by builders as pernicketty, and that for that reason charged 30 per cent. more when working under them. Each man, therefore, was the best judge, as to the cubical contents, of the cost.

Mr. Gregg said that was exactly what he had found in comparing notes with a few architects, and it seemed to him that it would be quite impossible to make a table of the cost of buildings in Toronto based on the prices given by a number of architects, and that was why he had closed his paper in the way it did. His object in giving the prices was not as a guide, but merely as a beginning or essay for each class mentioned.

Mr. Gouinlock said he had made a calculation of one or two buildings, and he found only a cent per cubic foot on factory buildings, and half a cent per cubic foot on residences of difference between Mr. Gregg's figures and the cost of work actually done this year.

Mr. Aylsworth interpreted Mr. Gregg's table to be more as a suggestion that each architect might utilise in his own way, and as such he thought it very useful, but he did not think it was adapted to be used as a hard and fast rule. It might, as had been suggested, be used in law courts, but he thought that would depend to a very large extent on the amount of confidence the presiding judge had in the architect's ability. He did not understand it was intended as a rule for all to adopt, but each architect in his own practice could make it very useful and valuable.

The President said there was no question about the value of the method of arriving at an approximation by cubing. He did not think, however, that Mr. Gregg intended the figures he had given to be sent forth for the guidance of architects as an infallible rule. He supposed most of those present used the cubing system more or less, and he thought it was really valuable if used with proper discretion, but it ought to be used with a great deal of care, because it was very easy to get different results from different systems. Each man must work out his own system, and by keeping a record of the cost of his own buildings, he would be enabled to get better results. A point to be borne in mind was that the comparative size of a building made a great difference in regard to the cost, especially in the case of buildings which may be divided into large or small rooms—schools, for example. There would be a great difference between a school divided into rooms holding, say, twenty pupils and one divided into rooms holding fifty. The same would apply to dwellings. He thought the members were very much indebted to Mr. Gregg for his valuable contribution.

THE LATE ALEXANDER GALLETTY.

NOT only Edinburgh but the country in general has sustained a great loss, says the *Scotsman*, in the sudden death of Mr. Alexander Galletly, curator of the Edinburgh Museum of Science and Art, who, although never prominently before the public, has long been recognised as one of the highest authorities in the many branches of knowledge which come under the general term of technology. Born at Perth in 1829 and educated at the grammar school of that town, he served a mason's apprenticeship under his father, who carried on a considerable business as a builder. As a young man he came to Edinburgh, where he was employed for some time in the building of Donaldson's Hospital. He afterwards entered the service of the Shotts Iron Company, in Leith Walk, in the capacity of accountant and book-keeper. While thus busily employed at his daily work he seized every opportunity of

extending his knowledge and developing the talents with which he was well endowed. In this respect and in many others he bore a strong resemblance to Hugh Miller, whose conspicuous example under very similar outward conditions had, in all probability, a powerful influence on his mind. He was an assiduous and very successful pupil in the school of art of the Watt Institution (now so happily developed into the Heriot-Watt College), and became a skilful draughtsman. This naturally led him to take a special interest in other forms of art, in some of which, more especially in the industrial, he soon became an expert. From its first inception as an industrial museum by the late Professor George Wilson in 1855, Mr. Galletly has held a prominent position in the Edinburgh Museum of Science and Art, where his extensive knowledge, varied acquirements, persevering energy and entire devotion to his duties have been of incalculable benefit to the cause of technical education as affected by technical collections of specimens. Besides discharging his functions in the museum, Mr. Galletly found time for a good deal of miscellaneous literary work on subjects connected with his department. Thus he was a valued contributor to "Chambers's Encyclopædia," both in its first and in its recently completed editions. Probably no other contributor wrote on subjects so various, and yet all requiring special knowledge. The range of his information was truly encyclopædic in all that concerned manufacturing industries in almost every aspect—botanical, zoological, chemical and economical, as well as technical. And in many departments of art and of archæology his judgment was swift and cultured. As a writer he amassed his facts with skill and caution, and verified them with conscientious care; he was orderly and luminous in his statement, and had free command of a direct, simple and readable style. Mr. Galletly had just started on a long tour in England, undertaken in continuation of a similar journey last year for the purpose of identifying the casts of architectural details deposited in the museum, which had been taken from old English churches by Sir Charles Barry for the use of the workmen engaged in the decorative work of the present Houses of Parliament. In the course of his tour he had reached Nantwich, in Cheshire, where he was found dead in his bed, the cause in all probability being heart disease, from which he had suffered for some years, although, with characteristic reticence, he rarely referred to the fact of his doing so.

"The Architecture of the Renaissance in England."

SIR,—As a student, I never see the above advertisement of this beautiful book of picturesque architecture without thinking there is something wrong in the title. If I ask myself the question, "Renaissance of what in England?" I fail to get an answer, because the neo-Gothic, as it appears to me, is the only true Renaissance in this country—perhaps destined to develop into the national style of England.

The Italian Renaissance—the style referred to in the title—was not the parent of "the decadence" in England, which is the style illustrated, for Alberti, Brunelleschi, Serlio, Bramante, Palladio, Michel Angelo and others had long been dead before the architectural eccentricities of Bernini, Fontana or Borromini appeared. Unfortunately, it seems to have been these latter and not the former that originated the pretty English buildings of the seventeenth and eighteenth century. John Thorpe and Inigo Jones, or whoever introduced here curled pediments and other architectural eccentricities, must apparently have gone no farther in their travels than Venice, and so lost the advantage of seeing the great and noble works of the true Renaissance in Rome by the above first-named true and accomplished architects.

The title "Architecture of the Decadence in England" is not, perhaps, quite so dignified as that adopted; but it would be correct, and it would not have been damaging to a book that has done such good service in illustrating the picturesque buildings of the period.

But perhaps if Mr. Gotch should see this note he will be able to justify the title and enlighten a student of a somewhat critical turn of mind.

Sydenham.

A. A.

The Officers of the Devon and Exeter Architectural Society just elected are:—President, Mr. James Jerman; vice-president, Mr. C. E. Ware; council, Messrs. F. J. Commin, J. Crocker, J. M. Pinn and A. Thorne; hon. treasurer, Mr. C. J. Tait; hon. secretary, Mr. E. G. Warren.

SCHOOL BUILDINGS.

Heywood.—The foundation-stone of the Heywood Technical School has been laid. The building is practically three storeys in height. The basement will contain weaving and spinning room (48 feet by 30 feet), weaving classroom (18 feet by 19 feet), engineering workshop (29 feet by 17 feet), carpenters' workshop (31 feet by 21 feet), with all necessary store-rooms, lavatories, &c., engine-rooms for driving the machinery, and is complete with well-lighted corridors. The different rooms will be well ventilated and lighted, having spacious areas all round the building. The ground floor will be well laid out for scientific purposes, having science lecture theatre (60 feet by 30 feet), science drawing-room (32 feet by 21 feet), three classrooms (21 feet by 16 feet, 21 feet by 12 feet, and 20 feet by 18 feet respectively), with accommodation for the committee, secretary, &c., and also spacious staircases, lavatories, &c. The first floor will contain elementary art room (48 feet by 30 feet) and advanced art (30 feet by 30 feet), chemical lecture-room (23 feet by 22 feet), chemical laboratory (35 feet by 22 feet), store-room (22 feet by 11½ feet), with the usual preparation-room, balance-room, &c., and a well-lighted corridor, spacious staircases, lavatories, &c. The main fronts will be faced with stock bricks from Mr. Henry Dennis, of Ruabon, North Wales, with stone dressings, and the roof will be covered with Westmoreland slates and the areas enclosed with an ornamental iron railing. The heating and ventilation will be by Messrs. Pickup & Co., of Bury. The architects of the building are Messrs. Woodhouse & Willoughby, King Street, Manchester, and Stockport, who obtained the commission in "open" competition. The internal flooring generally is of carefully selected pitch-pine.

GENERAL.

The A.A. Camera Club will hold a meeting on Wednesday, the 14th inst., when Mr. R. Elsey Smith gives an address, entitled "My Travels in Greece and Cyprus," which will be illustrated by lantern slides.

Mr. P. Turner, of Mason College, Birmingham, has been appointed director of the technical instruction committee of the Staffordshire County Council.

Mr. E. T. Felgate gave a lecture at the meeting of the York Architectural Society, entitled "Chicago Exhibition," descriptive of the architecture of the buildings and the various departments, &c., of this vast undertaking, Mr. J. Lane presiding.

The City Commission of Sewers on Tuesday announced that they had considered the complaints of citizens and others, alleging that a district surveyor had charged fees in respect of sky-signs which were merely hanging advertisements over footways. The committee, having viewed the so-called signs, reported that they could not be so designated, and they recommended that the London County Council should be so informed, and that the surveyor should be ordered to return the fees.

Mr. Waterhouse, B.A., has been appointed architect for the new building of the British Institute of Preventive Medicine.

The Rev. G. F. Browne, D.C.L., F.S.A., canon of St. Paul's, will read a paper before the Society of Architects, on Tuesday next, upon "Early Christian Art in England," which will be illustrated with the aid of a large number of slides.

The Spring Art Exhibition of the Southport Corporation opened on Monday to the general public.

Mr. Thomas Howdill, architect, Leeds, has removed his offices to 24 Albion Street, Leeds. Having taken into partnership his son, Mr. Charles B. Howdill, the practice will be conducted under the title of Howdill & Howdill, architects, &c.

At the Annual Meeting of the Governors of the West London Hospital it was stated that competitive plans for the enlargement had been received from three architects, and the designs sent in by Messrs. Wm. Harvey & G. H. Hunt, of 7 Whitehall Place, S.W., had been accepted. The plans had been so arranged that sections could be erected as funds permitted, and the Board considered that the pavilion block in Wolverton Gardens, providing sixty additional beds, should be the first portion taken in hand. The estimated cost of this, together with the connecting corridors, was about 15,000*l*.

Mr. H. Saxon Snell has resigned the appointment of architect to the Holborn Board of Guardians, which he has held for the last twenty-four years, as he is retiring from the firm of Snell & Sons.

The Aberdeen Artists' Society will hold an exhibition in the Corporation Galleries during September and the three following months.

The Cheltenham Town Council have decided to raise the salary of Mr. J. Hall, borough surveyor, from 550*l*. to 650*l*. per annum.

The Architect.

THE WEEK.

At the annual meeting of the Associated Chambers of Commerce on Wednesday the following motion was unanimously adopted:—"That the Board of Trade be requested to initiate legislation for altering the laws regulating registered designs, so as (1) to permit search on the premises of persons reasonably suspected of making or selling articles to which a registered design is applied, against the consent of the registered proprietor; (2) to penalise persons exhibiting like articles for sale who, on demand by the registered proprietor, refuse to give all the information in their power with respect to the persons from whom they obtained such articles; (3) to provide for the early and compulsory reference of questions of infringement or novelty to the award of experts in the class of goods concerned; (4) to make importers or agents for the sale in this country of piracies made abroad liable to penalties, as if they had applied, or caused to be applied, the pirated design; and (5) to enlarge the limitation imposed by the Patent Designs and Trade Marks Acts, 1888, on penalties recoverable." It is time that legislation of the kind should be enforced, for there is no doubt that piracy is carried on to a scandalous extent, and it is not to be excused by saying it is only an incident in commercial competition.

At the meeting of the London Council on Wednesday it was agreed:—"(a) That the Council do spend a sum not exceeding 500*l.*, as a preliminary step towards the preparation of a ground plan of London showing the various freehold owners. (b) That the statistical officer and valuer be instructed, under the direction of the committee, to provide maps and other documents that may be required, and to tabulate the necessary statistics, with such assistance as the Council may hereafter sanction. (c) That the valuer be instructed to place himself in communication with the Ecclesiastical Commissioners, the Commissioners of Woods and Forests, and other Government authorities and landowners, with a view to obtaining plans and information which would enable him to lay down on a map the property in London belonging to them. (d) That the local authorities be requested to allow the valuer gratuitous access to any parish or local maps and any local records which might assist him in the preparation of the plan. (e) That the Treasury be requested to allow the Council to inspect and take extracts from the Middlesex register for this purpose without payment of the usual fees, as from time to time may be required; and also to allow the Council to have the services of an officer of that department conditionally on its undertaking to pay a share of such officer's salary."

A MEETING of the West Riding Council was held on Wednesday at Wakefield, when the following motion was brought forward:—"That the tender of Messrs. ARMITAGE & HODGSON, contractors, Leeds, amounting to 72,506*l.*, be accepted for the works set out in the general specification, comprising a council chamber or hall and offices for the administrative and other work or business of the County Council, together with caretaker's quarters, and including the fitting up of the same with heating or warming and ventilating apparatus, and that the West Riding solicitor be instructed to prepare the necessary contract, and that the common seal of the Council be affixed thereto." Mr. BENSON FORD said that the reason given at first for the selection of Wakefield was that the cost of buildings there would be 36,000*l.*, while at Leeds it would be 72,000*l.* He wished to know, if the figures were not fallacious, why the cost at Wakefield had increased to double the assumed amount. Alderman BRIGG said that it was originally proposed to expend only 10,000*l.* on improving the existing buildings at Wakefield. He therefore proposed, as an amendment, that the resolution should be sent back for further consideration. The explanation offered was that the sum that was first mentioned was based on a rough estimate of the surveyor. The amendment was carried by a large majority. It is to be hoped that no diplomatic action between the committee and their friends

will minimise the effect of the vote. The West Riding case is only one among several in which estimates of cost are put forward as a matter of form and without any regard to the cost of work. Afterwards, when tenders of larger amount are sent, the architects are blamed for incompetence to meet the economical desires of the authorities. Leeds is the proper site for a council hall, and the opportunity should be seized to abandon the Wakefield scheme without delay.

THE city surveyor of Sheffield, like the majority of gentlemen who hold similar appointments, has, in the engineering work entrusted to him, more than is sufficient to tax his abilities. The Sheffield City Council have contemplated an increase of his duties, for they appointed a special committee to report whether he could not likewise undertake the architectural work of the city. The Council of the Sheffield Society of Architects accordingly sent a remonstrance, in which it was stated:—"That the city surveyor has daily duties so important and multifarious that he cannot have the time at his disposal for the quiet conception and elaboration of the design of public buildings, nor yet for the constant general superintendence of their construction, so that to place such work in his department will necessitate the deputing of it to assistants. That to depute such work to assistants is not likely to be so satisfactory in any respect as to commission architects of ability and experience." After the communication was received the following resolutions were passed by the special committee of the City Council:—"That the members of this committee, having fully considered the questions referred to them, are of opinion that the city surveyor cannot reasonably be expected to undertake the preparation of the necessary plans and detailed drawings for the proposed additions to the Court House." "That with regard to the architectural work other than the additions to the Court House now in the office of the city surveyor, this committee is of opinion that he and his staff will be able efficiently to carry out the same, and also that a thorough reorganisation of the staff should be made when the department is removed to its offices at the town hall." This result is not so satisfactory as was to be expected, for it is no more than a compromise. Evidently it is contemplated to engage one or more architectural assistants for the surveyor, and with their aid Sheffield is to be beautified. Whatever may be the utility of Mr. RUSKIN's museum, it has not induced the City Council to appreciate the ability of local architects.

It is a humiliation for the Cardiff Town Council to acknowledge that a great many builders in the town treat the building by-laws with absolute contempt, and erect buildings in utter disregard of the Council's authority. In such cases the builders are not entirely to blame, for if the procedure is lax, and the operations of a Council are tedious, it is not to be expected that builders and clients will lose time in awaiting the approval of plans. It is far more economical to pay the heaviest fine that can be imposed. The Cardiff Council a few days ago summoned the proprietor of a steam joinery works for erecting a wooden shed without obtaining their approval. A structure of the kind near a railway siding is a public danger, and the Council were justified in asking for a penalty. The defendant, it appears, had refused to submit plans, but in the police court it was stated on his behalf that the error arose out of the neglect of an architect who had been requested to prepare the plans. The excuse did not satisfy the magistrates, and the majesty of the Council was vindicated by the infliction of a fine.

DURING the next fortnight competitions between workmen engaged in the following building trades—bricklaying, carpentry, joinery, masonry, plumbing, plastering, tile-laying, &c.—will be held at the National Building Exhibition in the Agricultural Hall, Islington, under the direction of a special committee. Any workman can take part in it without entrance fee or other charge. Competent judges will examine the works, and on their awards gold, silver and bronze medals will be awarded in each department. The project is novel and must enhance the interest of the exhibition.

BUILDINGS AND EARTHQUAKES IN JAPAN.

IS it possible to construct buildings that can withstand earthquakes in a country like Japan, where the seismic convulsions appear to have a certain amount of measure? That is a question which is now engaging the attention of the Government as well as the followers of science, native as well as foreign, in Japan. The earthquakes of 1889 and 1891 have unhappily afforded materials for the study of the question. Buildings that were erected by foreigners as well as all classes of native buildings are evidence of the force which was exerted. In some cases there was destruction, in others more or less injury. It is reasonable then to suppose that from a close examination of the phenomena some conclusions could be drawn respecting the materials and the mode of construction which were least affected during the disturbances. The duty of reporting on the subject appears to have been entrusted to Mr. JOSIAH CONDER, and he has contributed over ninety pages of his "Notes" to the *Seismological Journal of Japan*. His object is, he tells us, "to record fairly without prejudice to any style the effects upon all classes of structures," and therefore "care has been taken to avoid all exaggeration and sensational description, which are perhaps tempting instruments for arousing public attention to scientific investigation."

Mr. CONDER seems to have jotted down his observations in the order in which they arose. The principal towns in which his investigations were conducted are Nagoya, Gifu and Osaka, all on the south coast of the main island. Between those places he was also enabled to observe the effects of the earthquake on farmhouses and other detached buildings.

On his journey to Nagoya, Mr. CONDER tells us he perceived evidence of the spent force of the movement in plaster and ridge tiles which had been cast down. It does not require immense power to accomplish an amount of injury, for "the tiles of all Japanese roofs are simply laid upon clay spread over the roof with a slight lap; the ridges consist of layers of tiles also pointed with clay, and in some cases externally pointed with lime mortar." An old farmhouse was found in a collapsed state. Religious people would probably believe a miracle was performed when they saw an image of the god KWANNON standing unscathed on a pinnacle of a rock while the piers of a railway bridge were cracked.

Nagoya, which has become an important town under the new condition of affairs, both in the buildings that were European in style and those after ancient models, presented signs of inability to resist the earth movements. Before the catastrophe Nagoya displayed many of the characteristics of the most ancient towns. Professor MORSE selects it as an example of those which are remarkable for the uniformity of the level of the roofs as for the antiquity of some of the buildings. From Mr. CONDER's reports it is evident that the low native buildings have advantages when there are terrestrial disturbances. A large Japanese hotel was seriously damaged, but it was mainly owing to "the fall of the upper walls of the adjoining post and telegraph office." The gateway, however, was in foreign style, and the tops of the pillars, which bore lamps, were turned round. The Hongwanji Temple, which is constructed with massive timbers, was saved, "even the heavy ridge tiles and terra-cotta terminals of the roof seemed unchanged." But the adjoining buildings, which were of a lighter form, were damaged. Another temple that was two centuries old lost some tiles and plastering. The two Japanese theatres also suffered, but on the whole the native structures in Nagoya and the neighbourhood were let off easily. Mr. CONDER arrives at the following conclusions about the behaviour of the buildings:—

It seemed an indisputable fact that the monumental class of wooden buildings of pure Japanese construction showed remarkable powers of resistance to the earthquake. Such damage as had occurred to them was the falling of plaster-work and tiles, and in some cases a sliding and twisting of the supporting pillars, which had in two or three examples shifted the structure off the isolated stone supports, but without throwing it perceptibly out of the perpendicular. Lighter buildings annexed to these heavy structures had invariably been damaged by the oscillation of the heavier mass. The roofs in all cases showed wonderful stiffness, and in many instances not a tile was shaken off. Tiles, where used in combination with thatch, had been thrown off. On the other hand, the ordinary Japanese city buildings, and a few of the older structures of better class, had yielded like a

broken chair, collapsing when not held up by adjoining structures. The same principles and methods of construction were followed in these ordinary buildings as in the large temples; the weight, size of timbers, and consequent strength and stiffness of joints in the latter alone distinguishing them. It appeared to the writer, therefore, that the advantage was not one of method of construction, but rather one of strength and mass in the heavier structures. The scantlings and mass employed in these monumental structures it was impossible to apply to ordinary structures, both for reasons of utility and economy. Also it must be remembered, in comparing them with other classes of buildings, that there existed no monumentally solid structures in masonry or brickwork to compare with these temples, such brick buildings as had been examined being mostly of the speculative or commercial class, and of poor construction.

The new style of buildings were less fortunate. In the brick walls of the post and telegraph office, which was erected four years before the earthquake, the mortar was in some places forced out of the joints, and in consequence walls settled or tumbled, bringing other parts to ruin. The building was not creditable to the workmen. In the garrison office, which was substantially built, all the walls, with the exception of triangular pediments, remained standing. The powder magazine was constructed under the direction of the Military Department. In the plinth notched stones were used, the idea being probably derived from some old account of the Eddystone Lighthouse. Mr. CONDER considers the notching is only an amateurish arrangement, but as the building escaped, it is claimed that the notching was devised to meet shocks. He believes that "the notching of plinth stones might form a most useful expedient against the effects of earthquake in the case of stone bases to light wooden buildings, when a sliding between plinth stones could take place, but in a heavy brick building the advantage does not easily appear." The military hospital, another modern building, displayed a rotation of the four corner-stones of the upper plinth course. The castle buildings suggested the advantage of having roofs trussed in every direction, so that none could act independently. Mr. CONDER also infers that "whatever conclusions might be reached with regard to brick buildings in general, magazines and fireproof stores, not used as dwellings and of no great height, were far less liable to injury if built in brick or even stone than the ordinary Japanese mud and plaster storehouse." Height has much to do with risk, for "nowhere up to the present had low brick structures been found seriously injured." The Japanese considered that next to their own castles and superior buildings the wooden buildings of foreign design offered most resistance.

The little town of Kasamatsu was found to be a heap of ruins. What the earthquake spared was overcome by the fires which followed, and which seem to be a common calamity on such occasions. At Kano most of the houses had fallen in, and those which remained were distorted. Mr. CONDER found that one gateway having the side pillars tied by diagonals had fallen, but the framework remained uninjured. As he says, "This could hardly have happened if the structure had in some way been fixed to the ground at its base; the loose isolated supports of a Japanese building here showed a decided advantage."

In the Gifu Gymnasium, Mr. CONDER found another example of the security which is offered by trussing a roof in more than one direction. It measured 35 feet by 50 feet, and remained intact. What was curious was that roofs of a cheaper and lighter kind, but in which the principle was observed, when they fell were not dislocated, and in consequence could be used as huts or places of refuge by the inhabitants. Mr. CONDER's remarks on the subject are worth reprinting:—

The writer has elsewhere had occasion to draw attention to the utility of this principle of double trussing applied to modern roofs for structures in earthquake countries, and which since the fatal earthquake of 1891 he has adapted to several important buildings. He does not by any means desire to advocate the copying of Japanese roof construction, an interpretation which one critic has chosen to put upon his observations. Such roofs are in many respects eminently unscientific, unnecessarily heavy and wasteful in material, and they at the same time require numerous internal supports. But in the one particular of being equally stiff in both directions they present an important advantage. And this solidity and stiffness can also be given to modern structures executed in a more scientific and economical manner. The problem becomes a somewhat complicated one in dealing with roofs of buildings of irregular and compound plan. The plain square or oblong plan invariably given to Japanese buildings is very favourable to such treatment; but the principle is capable of application more or less to any plan.

To no part of a building did an architect perhaps give less attention than to the roof construction. The engineer, on account chiefly of the large spans and the iron construction with which he had mainly to deal, calculated and considered carefully every part of the surface of his structure. It was the common practice of architects to provide a general roof-plan showing the positions of trusses and to supply only one or two details of individual trusses. These trusses were probably designed and calculated with considerable care, but in framing the whole roof together on a complicated plan, half trusses, three-quarter trusses, diagonal trusses and numerous unforeseen struttings, supports and modifications were required which were left mostly to the contractor or clerk of works to devise. The consequence was that, though the roof truss alone might be a very strong and scientific structure, the roof as a mass was often a very weak and unscientific one. This was not attended with any serious results where simple weight and stability were concerned; but in case of structures liable to be violently lifted and shaken, it became most important to consider the roof as a whole. It should as near as possible approach the form of a hollow pyramid, equally unable to yield or move in either direction.

The severity of the shocks in Ogaki was evident when it was seen that not more than thirty houses in a damaged state survived out of eight thousand. In the fire which followed the earthquake many of the inhabitants were consumed. Where the destruction was so general it appears that "certain old and rotten wooden fences curiously enough remained in position."

Osaka, being one of the most important of the capitals, obtained much attention from Mr. CONDER, for there he could make a more exact comparison of the relative advantages of materials and forms of construction than in Nagoya or the small towns. The premises of the Electric Lighting Company suffered considerable damage, which Mr. CONDER ascribes to the bricks not being properly soaked, and the vertical joints being unfilled with mortar. There is a great cotton mill in Osaka which was erected from English plans under an English clerk of works. It had a height of 67 feet to the cornice, with a tower that rose 20 feet higher, and was accepted as a model in the district. It is satisfactory to learn that "the building, although of unprecedented height for Japan, had suffered comparatively little damage from the earthquake, and the writer can but attribute this mainly to its solid, careful and conscientious construction. The light flat roof, having a skeleton of iron beams and acting as a fixed lid tying the top of the building, probably presented superior advantages to the ordinary sloping roof of heavy timber and of more or less independent trusses. The network of iron beams at the different floors, though not anchored, acted as important horizontal ties to the walls, without creating the large cavities occasioned by the use of enormous wooden beams; and the brick arches and concrete over these prevented them moving independently and battering the walls. Though the window openings were of large area compared with the wall spaces, a great thickness had been given to the intermediate piers." Mr. CONDER, however, believes that the tower was a source of weakness, and that if, for the flat arches to the openings, semicircular or pointed arches had been substituted, the building would have gained in strength. The Naniwa Mill was less spared. The floors were overweighted and failed, and a large part of the walls succumbed. The span was 120 feet, and there was a length of external wall without cross walls reaching 300 feet. In this case also the bricklaying was defective. Mr. CONDER records that "the vertical sides of the bricks were perfectly clean, not being even stained by mortar, which had been apparently smeared only on the beds. Even the mortar between the beds had no adhesion to the bricks, suggesting that they had been laid dry, a habit, as is well known to those engaged in practical work, most difficult to eradicate from the Japanese bricklayer, who has a most obstinate liking for liquid mortar and dry bricks. But the mortar itself was seriously defective; not only had it no adhesion to the bricks, but it had no cohesion in itself, and was easily reduced to powder with the fingers."

While large mills which represented the expenditure of much money fell asunder, it was curious to find a building that was cheaply constructed to hold a panorama cited as a model. The circular plan, the light roof, and the continuous wall-plate were all elements of security. In that case, as in others, the flimsiness was advantageous, while the Arsenal and other important Government buildings in Osaka were saved by massiveness of the parts. When experience is favourable to the two extremes of construction,

it is difficult to lay down a universal law on the subject. Mr. CONDER maintains, from what he saw, that there can be "no satisfactory compromise between strengthened connection and complete isolation." The parts of a building must either be independent or tied together in the most effective way.

The Japanese are dexterous and so much is produced in the country of a fragile kind, it is not surprising if they do not appreciate the firmness which is expected to be a quality in European construction. By nature and circumstances the people have a tendency to outdo the western jerry builder. Mr. CONDER laments the increase of audacity in structural work. At first mills of the English type were strange, and the owners and builders were forced to be careful. But having become familiar with the arrangements, they go on imitating "but thinning the walls, though at the same time increasing the spans, substituting wooden floors for iron ones, and wooden tile-covered roofs for light iron coverings; widening windows and decreasing piers; dispensing with cement; mixing mortar by hand instead of by machinery; and employing the services of assistants as superintendents. And lastly, we find the general contract system introduced, the contractors being mostly speculators of no experience, possessing no machinery, plant or special facilities, and the machinist in charge of the mill being the only supervising 'architect.'" There are English precedents for work that is as flimsy, but in this country there are no earthquake tests. The Japanese may argue that as their buildings are always liable to casualties it is not economical to expend more money on them than is necessary. In factories the people consider that the chimneys are the characteristic, the most essential part, and they must see, as well as Mr. CONDER, that "in the matter of factory chimneys, and also in the ordinary chimneys of buildings, the best and strongest class of structures seemed to have fared scarcely any better than those of inferior construction." As long as there are proofs of that sort forthcoming, there is some excuse for the Japanese if they hesitate to believe in the virtues of excessive strength. At the same time, it must be allowed that repeated experience of earthquakes has not enabled the Japanese to evolve a system of construction that accommodates itself to the strains which arise when the earth is disturbed. It may be assumed that on the ground, as on the sea, there is a chance for buoyancy when there are extraordinary agitations, and Mr. CONDER has mentioned many cases where things which were not firm seemed to be most triumphant. But it does not appear that under the fierce tests of 1891, the supremacy of the native system was demonstrated. Mr. CONDER fairly summarises the results in the following passage:—

The writer of the present record desires as much as possible to avoid all controversial matters, but he feels bound to state as his opinion that there is nothing in the character of the wall-framing or of the isolated foundations of purely Japanese structures which gives them any seismic advantage over European methods of framing and foundation. And this is amply and repeatedly proved by the effects of the earthquake of 1891. The advantages which such buildings may possess are entirely those of suitability to custom and climate. The instability of the parallelogram form of structure, liable as it is to rhomboidal change or displacement, is repeatedly observable, as may at any time be seen in a broken or creaky chair; and Japanese wall-framing consists only of parallelograms. The same applies to Japanese roof-framing; but, as already pointed out, such roofs have another compensating advantage, namely, that of transverse framing, which gives them additional unity and stiffness. The abstract theory that looseness of joints and liberty of movement is an advantage, that the convulsive forces of nature are so irresistible that they cannot be combated by weight and stiffness, and must, on the contrary, be met and neutralised by pliability, is a very plausible one, and one which is possibly to some extent applicable in practice. But if such looseness and pliability is unavoidably followed by breakage and disintegration, or by a change of form which destroys equilibrium and produces collapse, it is eminently useless and destructive. Foreign-framed wooden structures, and even exceptional Japanese structures containing triangular arrangements of struts and braces, had, on the other hand, everywhere preserved their forms.

It is fortunate for Japan that the subject can be investigated with the impartiality which is shown by Mr. CONDER. To make buildings earthquake-proof is not to be done without many trials, but the leading members of the Seismological Society appear to be working towards that end in a manner that is justified by the whole history of modern science.

THE NATIONAL BUILDING EXHIBITION.

THE Building Exhibition, which opens to-day in the Agricultural Hall, Islington, will, it is hoped, exert an educational influence in elevating the public taste. In order to supplement the lessons which can be derived from the sight of the objects, it has been decided to give a series of lectures and to institute competitions among artisans. The committee charged with making the preliminary arrangements have prepared the following report:—

The various matters connected with the exhibition that were referred to your Sub-Council, together with such arrangements that would be likely to conduce to the interest and success of the enterprise, have been carefully dealt with by us, and we are glad to report that, as far as it is possible to predicate, the character of the exhibition and its results will be alike creditable to the Consultative Council and of value to the important industries represented.

We learn from the promoters that, notwithstanding the disfavour with which past building exhibitions have been regarded, manufacturers have this year sent up exhibits who have not done so for many years past, and the promises for next year's exhibition assure even greater success.

Your Sub-Council have given considerable thought and time to the arrangements for good practical and entertaining lectures, as well as for the reading and discussion of important papers, namely:—

Monday, March 19, 3.30, H. W. Burrows, A.R.I.B.A., "Selection of Building Stone." Wednesday, March 21, 3.30, Sir Douglas Galton, K.C.B., J.P., D.L., "On Warming and Ventilating." Wednesday, March 21, 8.0, F. R. Farrow, F.R.I.B.A., "Picturesque Buildings," illustrated with lantern views. Saturday, March 24, 3.30, Professor Norman, "Chemistry of Clays and Marls." Saturday, March 24, 8.0, H. H. Collins, F.R.I.B.A., F.S.I., "Principles of Sanitary Building and Councils of Sanitary Institute of Great Britain," illustrated with models and diagrams. Wednesday, March 28, 3.30, Thos. de Courcy Meade, M.Inst.C.E., "On the advantages of Technical Museums in advancing Sanitation." Wednesday, March 28, 8.0, Professor Banister Fletcher, J.P., D.L., F.R.I.B.A., "Architecture: its Civic and Commercial Value," illustrated with large diagrams, views and photographs.

It has been thought desirable that there should be competitive work by artisans whilst the exhibition is open, bricklayers, carpenters and other craftsmen carrying out some set job in the presence of the company, the best workman being awarded a distinctive medal, to be given on a subsequent occasion. This competition, it is hoped, will tend to the encouragement of good workmanship on the part of mechanics in the building trades, and it is possible that the start thus given by ourselves may become at least an annual demonstration in the encouragement of good skilful handicraft.

The expenses connected with these additional features are necessarily somewhat heavy, but the promoters, regarding them as likely to put the exhibition on a sound permanent basis, have agreed to find the requisite money.

A difficulty having arisen in securing the presence of their Royal Highnesses the Duke and Duchess of York to inaugurate the exhibition, it was decided this year to open it without ceremony, but we have reason to anticipate the honour of a visit from one or more members of the Royal Family.

With a view to secure the attendance of professional gentlemen, about 5,000 special cards of invitation have been sent out in town and the country. All such invited guests will find at their disposal a reception-room in the central avenue, which will be fitted up and tastefully furnished by the courtesy of Messrs. Turner, Lord & Co., of Mount Street, Grosvenor Square. It is also an interesting fact that, by the gracious command of H.R.H. the Princess Christian, wall-hangings and curtains will be lent for this room by the Royal School of Art Needlework. The managing director, Mr. Larkins, has considerably allotted this site to the Council free of charge.

Your Sub-Council, under the presidency and with the indefatigable work of their chairman, Professor Banister Fletcher, having thus made much effort to secure success and to carry out the views of the Consultative Council, feel that they may confidently count upon the continued co-operation and support of the whole of their colleagues in the important work of raising the tone of our annual exhibition.

had only managed to secure one of the changes in the conditions which they desired, but that was an important one. The Town Council had agreed to appoint an assessor to adjudicate upon the designs. The reply, however, containing that information had only been received a few days ago, and unfortunately it had been delayed so late that its practical value was very much lessened.

The President said he thought they need not regret that the Council of the Association took this matter up. In securing the appointment of a professional assessor they had at least made an appreciable improvement on these conditions, and if the thing had not been done in a very gracious manner, perhaps it was all they might expect. Proceeding to refer to the deputation from the Council to the Edinburgh Town Council on the question of the proposed reconstruction of the North Bridge, the President said there had not been time to consult the Association, but the Council felt that it was of such importance that they were justified in moving in the matter, and they had no doubt that what they did would be thoroughly endorsed by all the members of the Association. The deputation was received most kindly, and he thought they might say from what they saw and heard that their remarks carried a certain amount of weight.

Mr. Thos. A. Croal then read a paper entitled, "The Man in the Street: a Non-professional View of Architecture," in the course of which he discoursed on various features in architecture as they impressed a mind not learned in the art. He criticised the plan, once so largely in use in Edinburgh, of building up streets on cellars, so as to create underground apartments. He commented upon the value of the roof in design, drawing instances from both Edinburgh and London; and dealing with the internal architectural arrangements of dwelling-houses, he put in a plea for variety in the shape of the rooms, and asked why all the rooms should be shaped like mere rectangular boxes? Discussing questions of church architecture, he dwelt upon the need for plenty of light to suit the modern requirements of worship. In conclusion he spoke of the reconstruction of the North Bridge, and expressed the hope that the new bridge would not be put in the hands of a lighthouse engineer. Were the members prepared to submit to the half-century-old gibe of the Camden Society, that "if we must be utilitarians we shall never be good architects"? He was persuaded the Association would not, and that if only the opportunity were offered there would be found architects who could so apply old principles to new needs that a bridge at once strong and stately, graceful and artistic—and perhaps economical besides—would be provided to displace the ugliness of to-day, and to adorn the grand site the bridge occupied.

THE SCHOOL OF APPLIED ART, EDINBURGH.

UNDER the auspices of the Board of Manufactures the drawings and other work of the students in the School of Applied Art are on exhibition for a limited period in one of the upper halls of the National Portrait Gallery, Queen Street. It had been intended, says the *Scotsman*, that the exhibition should only be open to the students themselves, so that they might see each other's work, but afterwards it was thought desirable that the public should have an opportunity of informing themselves of the good which is being done among the young architects and clever artisans of the city under this new educational scheme, which is now in its second session. The drawings on exhibition are the fruit of the work of the first session, and are of a very creditable character. There are in attendance sixty-five students—quite as many as the premises at command of the committee can accommodate—and in the classes, which are held four times a week in the morning and in the evening, an attempt is made to develop the individuality of the students along practical lines. Dr. Rowand Anderson is superintendent of the classes, and there are four teachers, Mr. Frank Simon and Mr. George Watson for architectural work, Mr. R. Burns for colour, and Mr. Birnie Rhind, A.R.S.A., for modelling. The drawings now shown illustrate the thorough character of the work performed in the school. One of the first things done is to give the students an accurate practical knowledge of the history of art, and in accordance with this plan there are shown what may be called concrete as well as analytical drawings of the distinguishing features of the several orders of Classic architecture. They have also been instructed regarding the measured shadows which pillars and projections throw, and have represented these in their drawings. Arcadings in perspective and examples of the best Classic architecture, many showing beautiful draughtsmanship, are on exhibition—the drawings in this section suggesting an aptitude by the students for the work in which they have been engaged. The studies in colour are also exceedingly good. For this part of the work the students have had the advantage of studying a number of Chinese and Japanese glazes, lent by Dr. Rowand Anderson, and the school had also acquired by purchase and by gift a fair collection of coloured stuffs, which are used as foregrounds and backgrounds

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Edinburgh Architectural Association, Mr. W. W. Robertson, president, before the proceedings commenced, referred in sympathetic terms to the death of two members of the Association, Mr. Heiton, Perth, and Mr. Simpson, Leith.

Mr. Aitken reported as to the correspondence between the Council and the Town Council of Kirkcaldy with reference to the competition for the design of the Beveridge Hall. The latter body had now given their final reply. The Association

for these studies. This instruction in colour will afterwards be turned to account in the harmonious and artistic designing of wall decorations. Another set of drawings shows the results of the Saturday afternoon excursions which the students under proper guidance have made to places of interest in the vicinity of the city. These illustrate also the varied tastes of the students. One has drawn some architectural bit that has taken his fancy, another a fine plaster ceiling, a third an artistic piece of furniture, a fourth a pretty piece of ironwork, and so on, each being encouraged to sketch what is most along the line of his own daily work. Another set of drawings represents the work of the prize-takers during their holidays. A fee of 10s. a session is charged from each student, but the aggregate sum received, and a good deal more, is returned to the students in the shape of prizes. All prizes are in money. Fifty-four pounds was distributed last year in sums of 12. to 52., and each student is required to spend the money in improving his art education, and to send the drawings or other work to the secretary to show how it has been utilised. In these drawings by prizemen the same diversity of taste has been displayed, and not a few of them show much accomplishment. The drawings are worthy of a visit by all interested in this scheme for the improvement of the technical knowledge of the young craftsmen of the city, and the members of the Town Council, who have supported the school of applied art so liberally out of the Government grant at their disposal, should not miss seeing the work, which should tend to set their minds at rest as to the good these classes are calculated to accomplish.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the annual business meeting just held, reports submitted by the committee and the treasurer were read, and showed the Association to be in a flourishing condition, both as regards membership and financial affairs. The reports were approved and office-bearers for the coming session elected as follows:—Hon. president, Mr. William Leiper, A.R.S.A.; president, Mr. A. N. Paterson; vice-president, Mr. W. Tait Conner; hon. secretaries, Mr. John White and Mr. Walter R. Watson; hon. treasurer, Mr. William Fraser; hon. librarian, Mr. Alexander McGibbon; committee—Mr. Hugh Dale, Mr. Robert J. Gildard, Mr. J. E. Potts and Mr. Andrew Robertson.

PALLADIAN ARCHITECTURE AND DECLINE.

THE course of lectures in Glasgow by Mr. William J. Anderson, on the architecture of the Renaissance in Italy, was brought to a close on Wednesday, the 7th inst., when Mr. W. Forrest Salmon and Mr. F. H. Newbery, the head-master, took occasion to express the satisfaction of the School of Art directors at the success of Mr. Anderson's work, and intimated that a similar series by Mr. Alex. McGibbon, architect, on Gothic architecture was arranged for next winter, as well as another course dealing with the advanced problems of building construction. In briefly reviewing the session's work in introduction, the lecturer stated that the Italian revival, like other revivals in art and architecture, took rise in bold and original work inspired by the prototype, but mixed with a good deal of what was current, and thereafter ran a course of closer approximation to that pre-existing type till something like literal reproduction was reached, rules prescribed, and the revival finally robbed of its vitality. Another characteristic tendency also observable in such a movement as the English Gothic revival is that the latest periods of the old work are first seized upon by the revivalists, who thereafter incline more and more to adopt earlier treatments. Thus the Italian Renaissance architecture, originating in the work of Brunelleschi and others who were inspired by a study of late antique Roman, gradually inclined to imitation of the style of Augustus's time, and ended in the almost Grecian work of Palladio. "Palladian Architecture and Decline" formed the special subject of the lecture, the chief part of which was devoted to an analysis and criticism of nearly all Palladio's works at Vicenza and Venice, which were fully illustrated by lantern views and diagrams. Although in England his name has attained a fictitious importance relatively to several earlier masters and his talents were buried in inferior material, generally his work showed good taste, a fine sense of proportion, and no little originality in composition. The works of his contemporary Vignola were shown in comparison, as well as those of other architects of the later period in Rome, Genoa and Venice, the most active centres of the time. The causes of decadence were manifold, but at least two tendencies of the kind are clearly distinguishable in the work itself. First, that of the purists, such as Vignola, Palladio and Serlio, bound a little too firmly in ancient usages and the measurements of Vitruvius, the results being the coldness and formality that was common to their work and teaching. Coeval with this, but outlasting it, and of wider and more

disastrous influence, was the tendency due in the first instance to Michel Angelo. In the hands of his imitators the traditional use of architectural features and detail is misunderstood or purposely misapplied, and uncontrolled freedom is indulged in with regard to their application. The Lombard colony of architects in Rome, partly it may be from racial disposition, seem to have most contributed to this resurrection of the grotesque, by which every building of the era was more or less affected.

EXCAVATIONS AT WELLS CATHEDRAL.

INTERESTING excavations have been made recently in the ground south of the cathedral church of St. Andrew, Wells, and also on the east side of the cloister. Canon Church, who has had charge of the excavations, writes:—

"It has been generally known, from evidence contained in the chapter documents, that buildings existed on this ground from very early times until their destruction in 1552. But the exact sites and character of these buildings were a matter of conjecture. The ground has now been thoroughly examined by excavations carried on by the Dean and Chapter under the direction of Mr. E. Buckle, the diocesan architect. The foundations of two buildings have now been laid bare, on different levels, and with different lines and dimensions. One was a small rectangular building of somewhat less than 50 feet from cloister wall to eastern end, consisting of nave and southern aisle or chapel. There can be no doubt that this rectangular building was 'the chapel of the Blessed Virgin Mary which is set in the south part of the great church near the cloister,' so described in many documents of the thirteenth century. It was a chapel of great antiquity, and the foundations may be of an earlier date than the church of the thirteenth century. There is a continuous history of a building on this site, called 'the lady chapel by the cloister,' from the middle of the thirteenth century until 1552. But within this time there were two chapels, one succeeding the other on the same ground. The first chapel was richly endowed for the celebration of funeral services or obits of two bishops and other members of the Bytton family in the thirteenth century, of Dean Godley and others in the fourteenth. Ordinations were frequently held here. Entries in the register of Bishop Stillington (1466-91) show that ordinations were held here in the years 1466, 1467, 1469. After that last year no ordinations in that chapel are recorded until the first year of Bishop Fox's episcopate, 1492. It is very probable that it was in that interval the old chapel was pulled down and a new and larger chapel was built there by Bishop Stillington, of which the foundations have now been partially traced, though the excavations are not yet finished. Foundations have been traced of north and south walls of a nave starting from the cloister wall and the present door in the east cloister wall and resting on the older foundations, of north and south transepts ending in circular or octagonal turrets, and of a chancel extending more than 100 feet from the west end of the cloister. There is no doubt that we have here the foundations of the chapel built by Bishop Stillington. He was a man high in favour with Edward IV. Archdeacon of Taunton, head of a hall at Oxford in 1442, he rose to be Lord Privy Seal, then Chancellor of the kingdom, 1467-73. Stillington only left this chapel, rebuilt chiefly as a monumental tomb and a chantry for memorial services for himself. The building, large and costly as it must have been, had not a long existence, and came to an unworthy end. By the Act of the first year of Edward VI. 1547, all endowments for the support of chantries were to be given over to the King. The uses for which this chantry chapel had been built were now forbidden and the endowments appropriated by the Crown, so the Bishop (Barlow) and the Chapter, burdened by the responsibility of maintaining the costly fabric and suffering under the late spoliation of their own property, saw no other means of relief but to pull it down to the ground."

TESSERÆ.

The Ravenna Mosaics.

IN comparing the primitive art of Rome with that of Ravenna, one is struck by the obvious difference between art derived through Rome from ancient Greece and the purely Christian work of the Adriatic city, wrought by Byzantine hands and with Eastern splendour of colour. Beauty of form is scarcely aimed at or is merely decorative; but the principle of symbolic art-preaching is in full force. Until these great mosaics are copied in the same material it is to be feared that a good idea cannot be obtained of them without a journey to Ravenna. They are distinguishable from those in St. Mark's, at Venice, by the subordination of the gold backgrounds to the most wonderful gradations of dark azure and green in the figures and decorations, which range in colour from the hues of deep sea and purple night to those of malachite and emerald. The high lights in all of them are put in boldly and precisely with golden

tesserae, and white figures are introduced as freely as in the atrium of St. Mark's. Crimson and scarlets are more rarely used, and made precious in the work. The processions of male and female saints in St. Apollinare Nuova are a delightful illustration of this; and so many distressing photographs of them are in circulation, necessarily conveying ideas of utter gloom, blackness and barrenness to the public, that we will vainly try to describe the glorious hues which deck those forgotten walls with the afterglow of the sunken past. The purple and white marble columns of the central aisle of the basilica support on each side a processional frieze in mosaic of male and female saints, ended on the male side with the Lord in glory, a head and face of extreme beauty, though with something of the sadness of later and fallen art; on the female side, by an adoration of the Magi, exactly like some in the Roman catacombs. All the figures are white-robed and tread on emerald green turf, separated from each other by upright palms bearing scarlet dates. They are shod also with scarlet, and bear small crowns in their hands lined with the same colour. The background is of gold, not bearing a large proportion to the size of the figures; but above them are white single figures with ample golden spaces, and a third course of singular representations of New Testament subjects runs round just below the roof, with backgrounds of alternate gold and black; black, or the darkest purple, also prevailing, relieved with gold, in the roof. The splendid and jewelled effect of the whole is beyond praise, and its brilliant lightness makes it especially suitable to the dark aisle of a great city.

St. Andrew, Vercelli.

The style of the whole exterior is that later form of Romanesque which, we may say, was common to Germany and Italy, and which even in Germany lived on some way into the thirteenth century. The round arch is used throughout, except in the quasi-English lancets at the east end and in the transepts. It is when he gets inside that the Englishman feels more at home. It might, indeed, be argued that the inside of St. Andrew's is, after all, not so much English as French. It is, of course, neither purely English nor purely French; but the style which it exhibits is that form of the Early Gothic, or, more strictly, the last stage of the transition from Romanesque to Gothic, which is common to France, with a part of England. It will not remind anyone of Ely or Salisbury or Beverley, but it ought to remind anyone who has seen them of Wells and Glastonbury and Llandaff. And yet, in the mere shape of the clustered columns, Vercelli really comes nearer to Ely than to Wells, while the mouldings are—here the Italian element comes out—less advanced than they would be in any English or even French church of the date. But the capitals would seem quite in place in the great churches of the West of England, and in many French churches too. The proportions are quite northern. There are no broad sprawling Italian pier arches here. That the clerestory windows are round-headed is not wonderful, but the blank triforium space is an eyesore. In this point Modena, a hundred and fifty years earlier, had got ahead of Vercelli. On the whole perhaps the inside of St. Andrew's is less satisfactory than the outside. Yet its slender columns, its vaults, its noble octagonal lantern, make a grand interior in itself, while the interest of seeing forms of this kind where one would so little have looked for them is something beyond words. Walo helped to rob us of our money and our freedom; but he certainly learned a good deal in the way of art, most likely in our own island, certainly on our side of the Alps. By this time the seed sown at Spalato and Ravenna had grown in northern lands into something which Italy might well try to transplant, but which she never succeeded in reproducing.

William Blake.

Blake, in his lifetime, was always specially resentful of any imputation against his fame as a practical workman, or his judgment as a student of art. In one of his marginal notes to Reynolds's "Discourses" he lays down the rule that "Execution is the chariot of genius," and again he says, "Invention depends altogether upon execution or organisation. As that is right or wrong, so is the invention perfect or imperfect. Michel Angelo's art depends on Michel Angelo's execution altogether." And in the public address which Blake intended to accompany the engraving of the Canterbury Pilgrims, he declares, in reply to those who would admit the excellence of his ideas in art, but deny his powers of expression, "I am, like others, just equal in invention and execution, as my works show;" and further he adds, "A man who pretends to improve fine art does not know what fine art is. Ye English engravers must come down from your high flights; ye must condescend to study Marc Antonio and Albert Dürer; ye must begin before ye attempt to finish or improve, and when you have begun you will know better than to think of improving what cannot be improved." To any student of Blake there is, however, need of no quotation from his written opinions to establish the conclusion that he laboured with a constant reference to the possi-

bilities and the means of expression. As an artist, no man's vision was ever more definite in its form; and if there is one special gift which distinguishes him clearly from other and lesser men, it is his power of finding for every sublime thought a corresponding and precise image in the language of art. Blake was from the beginning as close a student of the technical parts of his craft as of its imaginative capabilities. He was a keen and even a severe critic of excellence in workmanship, a diligent observer of all forms of executive mastery in which he had any belief, and his fiercest onslaughts on the works of other painters, ancient or modern, are commonly grounded upon defects of expressional power. There is good cause for insisting upon Blake's powers as a practical artist, and for testing his work by the severe rules he himself laid down. In the first place, this is the only test by which a painter can be finally adjudged worthy of enduring fame. The gift of vision divorced from adequate means of expression may perhaps be proved satisfactorily to the friends of a poet or a painter, but it can have but small significance for posterity. Those who have never known the man can only care to know of his name in connection with an achievement of worth in itself, and, therefore, Blake's place among painters or among poets must be just what his work now proves him to be. This truth seems obvious enough, but there nevertheless remains the fact that English art, if not English poetry, has repeatedly suffered by its neglect. Men have been admitted to a certain reputation in their craft merely from the accepted belief in their gifts, without sufficient practical evidence, and in English painting especially there has been a most unfortunate tendency to award the prize of merit for all other qualities than those which are special and indispensable to a painter. It would be very unfortunate if the unhappy rule should be followed in the case of Blake, and the misfortune would be the greater, seeing that he possessed in a high degree the very qualities which so many English painters have been without.

The Roman Allotment System.

Taking his stand in the centre of the territory which was to be allotted to the new colonists, the augur, according to the old Etruscan rite, drew imaginary lines with his staff athwart the face of the heavens, one horizontal from left to right, another vertical from head to foot, and the agrimensor or surveyor, fixing his quadrant on the spot, divided the district by two broad paths, called the *cardo* and *decumanus*, the one from north to south, the other from west to east. He then proceeded to mark off the whole area by *limites* or balks into the required number of rectangular spaces, which the Romans called *centuriæ*, but to which we should give the less elegant appellation of blocks of land. Each colonist received one or more of these lots according to his military rank, and their size varied according to circumstances, though in the imperial times it was generally much greater than the two jugers or a single acre which was deemed ample reward for the soldiers of the early republic. The whole territory, however, assigned as the *ager* of the colony, was not in all cases given exclusively to the colonists; portions of it were reserved for the more favoured of the dispossessed natives. The Romans were accustomed to mark out the boundaries of estates and fields with stones, *cippi* or *termini*, inscribed with letters and symbolic devices, and consecrated for the security of property with religious observances. Not in Italy only, but throughout the provinces, particularly those of the West, did they carry out this practice; it formed a part of their system and science of mensuration, and upon this basis the fabric of the imperial taxation was in a great measure founded. This actual demarkation of the land was transferred to charts on brass or linen, and registered in the archives of the exchequer. The whole system has perished—brass, stones and all; no such thing as a terminal stone exists throughout the vast space over which went forth the decree of Caesar Augustus, that "all the world" should be taxed. Fifteen or sixteen centuries ago there must have been millions of them. All have perished. Mr. Hallam has remarked that "the oldest things in England are the hedges." Strange to say, these flimsy barriers of sod and brushwood which cattle trample down, and where boys "break through and steal," which require repair and restoration almost from year to year, have outlived the solid landmarks of the steadfast terminus. Such utter ruin has swept over the face of ancient civilisation in respect to the most fixed and cherished of its features. The pledges of the estates of a millionaire have everywhere been broken up to save perhaps a few halfpence in carting of stones.

Raphael and his Times.

Raphael was happy in his parentage and in his patrons, in his master and in his pupils, in his friends and in his rivals: the first misfortune of his life was its rapid and untimely close. He was late enough to profit by the example, early enough to feel the living influence of four of the greatest masters of his art—of Leonardo da Vinci, Michel Angelo, Giorgione and Fra Bartolomeo. The art of painting in oil had been introduced

into Italy barely half a century before his birth; its technical difficulties were already mastered, but it still awaited a master's hand to develop its latent capabilities. His short life included the Augustan age of papal Rome, the age of its splendour and magnificence, if not of its power, and he died almost before the far-off sound of the rising storm had broken the religious calm or foretold the coming miseries of Italy. The two pontiffs whom he served outshone the most illustrious of their predecessors in their luxurious tastes and lavish patronage of the fine arts; and the arts still served the Church, not only with the grateful zeal of favoured children, but with the earnest devotion of undoubting faith. More perhaps from natural instinct than from calculating policy, the Church of Rome has ever been the warm and generous patron of the arts: clothing the mysteries of her faith in forms that speak to the senses, she has wisely sought their aid to win and keep the ready homage of the feelings; while her more northern daughter, with cooler head if not a colder heart, appealing solely to the reason, has laboured in her name to suppress an influence she disdained to use. In the age too of Raphael, while the rich and often graceful legends of the Catholic mythology still retained their ancient hold on the popular belief, the growing taste among the learned of the day for the literature and philosophy of ancient Greece had done much, by softening their early rudeness ere it chilled their early feeling, to mould them to the higher purposes of art. In the newly-opened stores of classic history and fable, the painter was soon to find a new and wider world for the exercise of his art; in the yet unknown and unsuspected specimens of ancient sculpture and decorative painting, new and higher models for the guidance of his taste; and Christian art, relinquishing at last her long attachment to traditional types and conventional treatment, was willing to exchange a fruitless opposition to the graces and beauties of ancient art for a bold attempt to enlist them in her service. The wealth, splendour and prosperity of Italy had just touched the highest limit it was destined to attain; had raised the admiration, not yet excited the cupidity of Europe. The ferocious bands of France, Spain, Switzerland and Germany still gazed from a distance in stupid awe, before they descended from their mountains to scour her fertile plains and rifle her rich cities of treasures they knew not how to value, but found it too easy to destroy. The freedom, it is true, of the Italian republics had already passed away, but the impulse they had given to the culture of the arts and the progress of civilisation in Europe was still acting, still felt. Their nobles had inherited their taste as well as concentrated their wealth, and strove, like their prototypes of old, to beguile the citizens of the memory of their liberties by a lavish display of splendour and magnificence.

Homeric Descriptions of Works of Art.

If we were to take Homer *au pied de la lettre*, and treat all his descriptions of works of art as sober and prosaic accounts of objects which he had seen and handled, we might fancy that his art was more advanced than any of the archaic Greek works which have come down to us. But Homer was a poet, and saw everything through the sweet haze of a joyous imagination. He had a rare faculty for perceiving beauty in the commonplace. There are several passages in the "Iliad" and "Odyssey" which enable us to prove this to demonstration. It is as a much beautified and enlarged copy of his own time and of the chiefs among whom he moved, that Homer represents the times and the heroes of the Trojan war. If Hector or Ajax casts a stone, it is such a mass as two men of the poet's own day could not lift. Diomedes in one day wounds and overthrows two of the immortal gods. The very horses of Achilles and Aeneas are of heavenly breed, and far surpass in all qualities the animals of more degenerate days. The hall of Menelaus glitters as you approach it with light like that of the sun or the moon. A hecatomb of cattle is a usual sacrifice for an Achaean hero, and he is able to produce from his tent talents of gold, vessels of silver, and tripods in unlimited abundance. Thus, again, when the poet has to describe the palace of Alcinoüs, of the wealthy Phæacian race, he runs riot and talks of dogs of gold and silver and torch-bearing youths of pure gold. Even the doors are of the same metal, while the doorposts for variety's sake are of silver. Of course we know that among the early Greeks the precious metals were not thus common. In the same way when Homer describes a work of art, especially when he ascribes the making of it to a god, we must not for a moment suppose that he had seen anything resembling what he celebrates. We can only conclude that he had seen something which enabled a fervid imagination to conjure up that which is described. If the poet saw a dog in bronze he would at once fill his heroes' halls with dogs in gold. If he had seen a shield with three or four simple scenes depicted on it, he would imagine that a shield made by Hephæstus must contain a score of complicated scenes. Even in seeing, his eyes had a vivifying power, of which a modern could scarcely form a conception. Thus in describing a buckle or fibula, such as he may have seen, bearing the subject of a

dog seizing a fawn, he says, "All wondered at the way in which the dog gazed at the fawn as he throttled him, and the fawn, struggling to escape, quivered in every limb." Such language would be almost too vivid in describing a picture by Landseer, and when we compare it with the most expressive works which can be assigned to Homeric times, it may well appear almost absurd. But in all this Homer was neither before nor behind his contemporaries. They said of the mythical Dædalus, who was supposed to have been the first to separate the legs of statues and to indicate the pupils of the eyes, that Dædalus made statues to see and to walk, and so little was this of a metaphor to them, and so completely did they mean what they said, that in some temples they even chained the Dædalian figures of deities by the leg to prevent them from running away. So Homer speaks of the golden maids of Hephæstus as living and moving, and on the same principle, when tripods were set on easily-revolving wheels, Homer feigned that they could go on to the agora and return by their own volition. He was like those unspoiled children to whom a four-roomed cottage is a palace, and a wooden Dutch doll a fine lady.

Rome as a School of Art.

To the sculptor the advantages of a Roman residence are undoubted. Rome has for years held within her walls some of the most famed professors of the art. Canova, writing from the banks of the Tiber, says:—"Italy is my country—is the country and native soil of the arts. I cannot leave her—my infancy was nurtured here." It was among the seven hills, in the immediate presence of the Forum, the Coliseum and the Vatican, that Canova's genius found a fitting and abiding home. Thorwaldsen, again, born in the far north, obtained, at the age of twenty-three, a pension from the Academy of Copenhagen, started at once for Rome, fixed his studio near the Piazza Barberini, and founded, as is well known, his classic style upon the great originals of the Capitol and the Vatican. Flaxman toiled for five continuous years in order to lay in store sufficient means for the Roman journey upon which he had set his heart. During a seven years' residence in the land of poets he executed his famed outlines of Homer, Æschylus, Dante and other works. Gibson, like those great men, came at an early age to Italy, and formed his style upon the Grecian master-works. In the studios of Canova and Thorwaldsen he laboured, and in the midst of the antique marbles the best years of his life were passed. He knew how much he owed to Italy, and therefore he urged upon the Government of his country the foundation of an English academy in Rome, wherein pensioned students should be nurtured in the higher walks of the plastic and pictorial arts. There is no city comparable to Rome as a place for artistic study. It may be a minor, yet certainly it is by no means an unimportant matter, that the ardour of the youthful mind is kindled by the immediate presence of the great originals themselves. Casts from statues are often faulty, and no one will pretend that congregated plaster copies can be looked upon with precisely the emotion awakened by the marbles of the Vatican. Standing before the *Apollo*, the *Laocoon*, or the *Dying Gladiator*, it is not merely a question of what the eye can see, but how much the imagination will realise. We may rest assured that Byron would never have written his immortal lines at the foot of a chalk-white Venus. Mechanical products of but yesterday cannot have about them the halo of antiquity. A statue which has felt the chisel of Phidias, which, as god or goddess, has been worshipped in temples, which had to endure for long ages a nation's overthrow, and then, for a second time, rose into life, is necessarily encircled with a thousand memories, and grows eloquent in eventful story. To adapt an oft-repeated saying, the society of such works constitutes of itself a liberal education. Actual history seems handed down in bodily shape; the poetry of mythology is seen in the most perfect of forms, and thus the mental horizon extended indefinitely from the immediate point of view, art becomes, as she ever should be, the entrance-gate to noble knowledge.

Architects and Builders' Contracts.

An incapacitating calamity happening to the body or mind of the architect will excuse the performance of the contract by him. The architect's contracts being personal contracts, his representatives will not be entitled to complete any which may be unexecuted at the time of his death. The amount of remuneration, if any, which his representatives will be entitled to recover for work done by him in his lifetime will depend mainly on the terms of the contract. The builder's contract not being personal will pass, on his death, to his representatives. If they have assets, they will be bound to execute it, whether they are mentioned or not in the contract, or they will be liable to pay damages out of the assets. They may enforce the contract against the other contracting party, and recover remuneration for its execution. If the representatives of a deceased employer have assets, they will be bound to go on with the contract or pay damages.

NOTES AND COMMENTS.

THE position of assessors in architectural competitions does not appear to be generally understood. An architect can decline to accept the office unless it is agreed that his selection will be respected, and in most cases it is likely to be an advantage for the competitors if that course be followed. But assessors are only human, and they may be affected by qualities in a design which are not the most essential. Besides, local authorities might as well resign their offices if they can shirk the responsibilities attached to them. If a member of a Local Board or a School Board can call in an architect to aid him, he may, in course of time, claim the aid of other experts. It will then be difficult to say where his own utility begins and ends. A case has just occurred in Stockport which illustrates the deteriorating influence of the new system on a Board of Guardians. With the aid of an assessor, three sets of names have gained premiums amounting to 300*l.*, and, in fact, a sum of about 1,000*l.* has been expended on the competition. The author of the first plan has a claim on the commission for the building, but the second plan will, it is said, cost 10,000*l.* less than the first to carry out, or 30,000*l.* instead of 40,000*l.* The Guardians could not agree which was the most eligible, and accordingly they have sent off both sets to the Local Government Board, in the expectation that they will be spared the trouble of arriving at a decision. In the old days when assessors were unknown men did not evade their duties so easily. Another case which exemplifies the change comes from Scarborough. A majority of the School Board were in favour of appointing an assessor on the competition for the Vicarage Schools. The Chairman asked the Board if they realised what was to be done. It meant, he said, that they were to allow the decision about character and planning of the schools to pass out of their hands. For his part he would not place any man's judgment in such a case above his own, and there was no architect who was more competent to decide about the merits of a plan than their clerk. It will be said that the Chairman was only exemplifying John Bullishness of an exploded type, and his fellow members did not agree with him. But local government is an important consideration in England, and it will be only an affair of names and forms if those who are elected to govern are allowed to appoint strangers to take their places when discharging the most important duties.

A DECISION which was given last week by Sheriff CAMPBELL SMITH in the Dundee Court, upon a claim for half a dozen mantelpieces, must raise a good many questions about the functions of an architect. A draper in that unsavoury town was having a house built for himself in Wormit. Two oak and four bedroom mantelpieces were fixed in it which were supplied by a firm of cabinet-makers in Dundee. In the North business is sometimes conducted in an odd manner, and the draper does not appear to have troubled himself about where the mantelpieces came from. When the bill, amounting to 58*l.* 5*s.*, arrived, he repudiated all responsibility for them, as he gave no order for chimneypieces. The claim came before the Sheriff, who, as became a Scotch judge, took a sort of philosophical view of the whole affair. His lordship distinguished between conveniences and luxuries. Bedrooms, or rather two in the Wormit House, must have mantelpieces, therefore 6*l.* 9*s.* 6*d.* was awarded to the plaintiff for them, with 5*s.* for setting them up, but no costs. The Sheriff considered an architect was acting dutifully when he ordered bedroom mantelpieces. But mantelpieces that were to cost 20*l.* or 25*l.* a-piece for a drawing-room or dining-room came under a different category, especially as it was suggested that there should be some sort of correspondence between them and the furniture. "Does it fall," asked his lordship, "within the ordinary mandate of an architect to fix the wood out of which the best furniture of the house is to be constructed—to fix, for example, as this architect in effect appears to have done, that his client's drawing-room should be furnished with such an uncommon material as 'Chippendale' mahogany, whatever, according to Dundee terminology, that may be supposed to be?" The Sheriff concluded that

the architect was contriving to gain the furnishing of the rooms for the firm of cabinet-makers, and to secure that end ventured outside his province. The circumstance that the draper's wife and daughter had seen and approved of the mantelpieces beforehand did not weigh with his lordship. "Though I also believe that they talked, as ladies do," said the Sheriff, "in such terms of polite approbation of the design of the dining-room mantelpiece as to lead the pursuers to believe that they had made up their minds in favour of it, the evidence, however, does not go near the length of convincing me that they ordered it. Whatever mistakes the plaintiff may have made, I ascribe them to the talk and the influence of the architect. He has brought about this whole dispute by his undue haste and contempt for the opinion of his employer, who, to the best of my thinking, whether assisted by his wife or daughter, or both or either, was quite fit to select mantelpieces or any other objects of taste for his own house." As it was considered both parties were victimised through no fault of their own, they were left to pay their own costs.

THIS case, in common with many others which have lately arisen, suggests that common knowledge as to the nature and extent of an architect's business is not always sufficient. The majority of architects select mantelpieces as part of their duties, and their judgment is influenced not only by the character of the house, but of the furniture which is to be used and, it might be added, by their opinion of the taste of the owner. Yet an able Scottish judge considers that while architects are justified in bargaining for pine chimneypieces, they have no right to meddle with those which are made of more costly woods. His lordship maintained "that the selection of ornamental mantelpieces, whether of wood or marble or granite, did not fall within the implied mandate of an architect." Everyday practice could be cited as evidence that the Sheriff's dictum is not respected in this country, and with more consistency it could be affirmed that whatever can be considered as a fixture in law comes legally within the range of an architect's duties. Unless we are mistaken, Mr. Sheriff CAMPBELL SMITH's theory of the case originated in the belief that as an architect was an agent, an intermediary between a contractor and a building owner, the extent of his powers must be inferred from some sort of document like a contract deed, and in the absence of that sort of evidence it was reasonable to assume that a visit to a cabinet-maker's and the selection of a costly mantelpiece was an excess of authority. If it could have been shown that the architect of the Wormit house had reserved to himself with the approval of the client the selection of everything requiring artistic skill, the judgment might have been different. Of course such cases may come under the head of sub-contracts, and the liability of the building owner would have to be determined on other grounds.

IT is hardly probable that the Prince SCIARRA would have disposed of some of the masterpieces in his gallery in Rome if he had not been advised that he could not be punished under any existing law. For at least a couple of years he has been so successful as to suggest that advice of the kind was warranted. In the Italian courts, in which the case was tried, the Prince escaped, and when an effort was made by the Italian Government to obtain possession of the pictures through the French courts, it was also unsuccessful. At length the authorities decided to apply the edicts of the Papal Court to the case. They were often evaded, otherwise masterpieces of Italian art would be scarcer in European capitals. But the tenor of the edicts was strict enough against the selling of famous pictures to foreigners. Prince SCIARRA's luck has failed him in the Roman courts. He has been ordered to restore the family pictures or to pay half a million of lire, or 20,000*l.*, the penalty of imprisonment being remitted. It remains to be seen whether the present owner of the paintings will deliver them, for the possession of LUINI's two figures, known as *Vanity* and *Modesty*; the *St. Sebastian*, of PERUGINO; the *Young Man with the Bow*, by RAPHAEL; the family piece by TITIAN; the *Giucatori*, by CARAVAGGIO, are enough to increase the reputation of the wealthiest amateur. He may say, "If Italy wants my pictures let it come and take them."

GALATEA.

IN the early part of the sixteenth century AGOSTINO CHIGI, of Siena, was among the most prominent of the merchant princes, or, to use SHAKESPEARE'S phrase, "royal merchants," of Italy. His business was not confined to the land, for, like ANTONIO of Venice, his argosies were seen on all seas, and he was, moreover, the owner of mines. As became an Italian of rank, CHIGI felt it was his duty as well as his privilege to expend part of his wealth on works of art. Having through his influence at the Papal court obtained land lying between the Via Lungara and the Tiber in the Trastevere, and opposite the Palazzo Farnesi, he commissioned his townsman, BALDASSARE PERUZZI, to design a summer villa, which was to be as beautiful as money could procure, and was to be adorned with frescoes by RAPHAEL. Architect and painter were qualified to work together. VASARI'S account of the building is worth giving, for as he was also an architect, he was able to express the value of the work as it appeared after completion:—

This edifice should rather be described as a thing born than as one merely built. The exterior decorations are in *terretta*, and exhibit very beautiful historical representations, executed by Baldassare with his own hand. The hall of this palace is also adorned by this master, who painted columns in perspective therein, the depth of the intercolumniation causing it to appear much larger than it really is. But the most remarkable part of this work, and a subject of deserved admiration, is the loggia of the garden, wherein Baldassare has painted stories representing Medusa turning men into stone, and than which nothing more beautiful could possibly be imagined. Near this we have Perseus striking off the head of the monster, with other paintings in the angles of the ceiling. The decorations of this loggia are painted in perspective to imitate stucco-work, and this is done so perfectly with the colours that even experienced artists have taken them to be works in relief. I remember that the Cavalier Tiziano, a most excellent and renowned painter, whom I conducted to see these works, could by no means be persuaded that they were painted, and remained in astonishment when, on changing his point of view, he perceived that they were so. In the same palace there are certain paintings executed by Fra Sebastiano Veneziano (del Piombo) in his first manner; and by the hand of the divine Raphael there is the *Galatea* carried off by marine deities.

In our time the architect's deceptive painting is less appreciated than it was by his contemporaries. What gives the villa attraction to-day is the series of paintings by RAPHAEL, and especially the *Galatea* on which VASARI'S attention appears to have been concentrated. The vaulting of the first room is assigned to the legend of CUPID and PSYCHE, in which RAPHAEL contrived to introduce all the gods and goddesses. In connection with the incidents he painted the characteristic troop of cupids or amorini bearing symbols of the deities, that are universally known as "Raphael's Boys." The whole of them have been illustrated in *The Architect*. Neither the architect nor RAPHAEL seemed to care much about the effects of wind and weather on the frescoes. The room, porch or vestibule was partly exposed, like the loggie in the Vatican, and in consequence the paintings suffered to a deplorable extent. After a century and a half had elapsed, CARLO MARATTI persuaded the owners of the villa to have windows constructed in the side that was open, and if his suggestion had been disregarded, probably few traces of the *Cupid and Psyche* series would have survived. Unfortunately CARLO MARATTI repainted the background in blue, and however well-intentioned was his effort, it has made RAPHAEL'S works become a disappointment to many visitors to the villa. The skilful composition and the beauty of the figures hardly compensate for the discords offered by the colouring.

The *Galatea* is in an adjoining anteroom, and fortunately was always more secure from atmospheric influences. It is generally supposed that RAPHAEL did not allow any of his pupils or assistants to aid him in this work, although they were permitted to execute the paintings of *Cupid and Psyche* from his designs. The reason is obvious. The painting was a novelty. Mythological subjects were as familiar to painters in that age as any others, but the novelty of the *Galatea* is in the peculiarity of treatment. The picture possesses some of the qualities which belonged to Greek works. The general flatness, for the figures are almost placed on one plane, the contiguity of the cupids to the figures below, and the remoteness of the aerial and

marine beings from those of ordinary life, all testify that the painter was not following his ordinary course. The famous explanation which RAPHAEL offered to his friend BALTHAZAR CASTIGLIONE, beginning "*della Galatea, mi gran maestro*," further indicates that he was engaged in an experiment. The sense of the epistle is as follows:—"With respect to the *Galatea*, I should hold myself to be a great master if there were in it one-half of the merits of which you write, but in your words I cannot fail to perceive the partiality of your friendship for myself. To paint a figure truly beautiful, it might be necessary that I should see many beautiful forms, with the further provision that you should yourself be near to select the best; but seeing that good judges and beautiful women are scarce, I avail myself of certain ideas which come into my mind. Whether I have in myself any portion of the excellence of art, I know not, but I labour heartily to secure it." The expression about the rejection of models ("*io mi servo di certa idea che mi viene alla mente*") has been commonly accepted as a statement of RAPHAEL'S usual practice. The number of his studies from draped and undraped models should be enough to prove the absurdity of that conclusion. RAPHAEL was writing to a nobleman who was acquainted with the artist's method, and therefore he informs him that for the *Galatea* he adopted one that was strange. Instead of utilising a model, he trusted to his own creative power, or idealism, when painting the figure of the nereid. It is not unlikely that RAPHAEL was inspired by a decorative work, or a fragment of one, which some Greek artist had executed, and which he endeavoured to equal or rather to surpass. Whatever was the origin, the *Galatea* holds an unique position among the artist's paintings. Well may VASARI describe it as a fresco of the most exquisite beauty.

With that opinion the most thorough connoisseurs of all lands have agreed. BURCKHARDT, who is so difficult to satisfy, declares it to be the noblest of all modern mythological pictures ("*das herrlichste aller modern-mythologischen Bilder*"), and in his description of it he ceases to be coldly analytical and becomes enthusiastic:—

In it the allegorical myth that is used is no conventional motive for the creation of beautiful forms. What Raphael was eager to give could in that form alone be expressed with purity and beauty. What ordinary human story would have so well sufficed to express so significantly the awakening of love in all its majesty? The ocean princess becomes a type of pure, blissful longing. Surrounded by her nymphs and tritons, who are under the influence of love, she sweeps along the quiet sea, a mark for the arrows of the amorini; to the reins of her dolphin, a wonderful example of them has attached himself, as if to enjoy the impulse of being carried along the water. In the *Galatea* we can see how independent of the antique was Raphael in his feeling for form; every contour in the painting is his own. In his modelling he is more naturalistic than the Greeks; he shows himself to be a son of his century. The school of David might furnish figures that are more correct, but who would exchange those in the *Galatea* for any of them?

KUGLER, in describing the painting, says it is "one of the most beautiful compositions that art has produced, imbued with a sense of life and enjoyment that is perfectly enchanting. Yet with all this, and in a scene of strictly Pagan and sensuous imagination, the purity of the feeling becomes a main element in its beauty." If we were, however, to print all that has been said in praise of the *Galatea*, a volume would be needed. The only expert of any note who took an opposite view was RICHARDSON, in the early part of the last century. His criticism was curious:—"The *Galatea*; 'tis pretty well preserv'd, but does not answer the Idea I had of it. The face of the Galatea is not Handsome, nor perfectly well Drawn: And her Drapery, which was Red, and is flying in the Air, besides that it has no graceful Shape, is now so Black that it looks intolerably Heavy, and as Hard against the Ground as if it was Inlaid: But doubtless much of this is owing to the Changing of the Colour. Throughout the Colour is Disagreeable, upon the Dirty Reddish Tinct." The self-confident ingenuousness with which RICHARDSON suggests that his idea of the subject was superior to RAPHAEL'S is delicious, but it was by no means peculiar to him. Many English visitors to Rome have been no less assured of their infallibility in determining the value of pictures at a glance.

It is, however, much easier to condemn the *Galatea* than to make a copy of the fresco. On that account it is one of the least known of RAPHAEL'S works, and unless we are mistaken, the print which we now publish is the first that has appeared from the *Galatea* in this country.

GOLDSMITHS' WORK: PAST AND PRESENT.*

THE subject on which I have been honoured by being asked to speak to-night is a very large one, and one very near to my heart. It embraces so many points, its history and theory have been written about, spoken about, divided and subdivided under so many heads that historically and theoretically there is little that is new to say; but curiously enough, since the monk Theophilus wrote his famous treatise in the eleventh century little has been written on the practical side of the question; and as it is before the Applied Art Section of this great Institution I have the pleasure to appear, I shall venture to let my paper take a more technical form than would be desirable for a general audience.

Alloying, melting, working, colouring and polishing gold have been my chief studies and occupation for over twenty-five years; for long years before that I modelled, designed and drew for goldsmiths' work; and though I should easily be beaten in the use of a blow-pipe, and find it a little difficult to arrange very fine grains with a pallion of solder, yet I think there is no calculation for alloy or mixing of the precious metals, no pot for melting skittle, plumbago, or other kind, no tool for working, no direction of heat, whether a sharp point of flame, a blunt one, or an all over blast, with which I have not a perfect acquaintance. The different metals necessary to mix with the gold to obtain the softest and richest effects for enamelling, or the different qualities of solder best to use for various kinds of work, wet or dry colour, are all familiar to me; and this everyday experience of mine leads me to hope that I may be able to interest you in the working of the gold, and show how it was done in former times and how it is done now.

There seems to be a general consensus of opinion that gold was the first metal discovered. It is beautiful in colour, was found in rivers, in sand and on the surface, while other metals had to be dug from the bowels of the earth; it is so attractive in appearance, the most untutored savage would observe its beauty, and it was universally known.

Goldsmiths—that is, men who work in gold—are supposed to have been the first workers in metal, and to have been the pioneers in all the manual arts.

There is a popular idea that gold can only be fashioned by the aid of heat, but as I had occasion to point out in a lecture I gave last March, before the Society for the Encouragement of the Fine Arts, much of the ancient work was made without the application of heat at all.

In every small treatise, in whatever language it may be written on our subject, one quotation from an old author is always given, and as there is no better way of expressing the qualities of gold, I will repeat it:—"Gold is very ductile, a spreading and oily metal;" and to use an old workshop term, "it is very kind." It can be hammered, drawn as wire, and fashioned without heat, and it is almost the only metal which is ductile enough for this without the aid of steam power.

If we examine many of the oldest specimens, we shall find that they have been worked cold, beaten and twisted into shape by sheer force, which is, literally, an application of heat, but it is not so technically.

There is a tradition that Tubal Cain was the first to make gold-leaf. Anyhow, the art of beating gold is so old that, like the early history of most things, "its origin is lost in obscurity;" but, as every handbook will tell you, Homer and Pliny both refer to it. Homer also mentions and describes a blast furnace with twenty crucibles, and melting-pots have been found in many places in Egypt.

It was quite possible to have hammered together the little particles of gold found on the surface of the earth and elsewhere, and made them into rough utensils or ornaments without melting the gold at all; but probably as soon as furnaces and melting-pots were known, the gold was melted and run into a rude skillet before the hammering process began.

It would take up too much time to mention the various places where gold was found in bygone times, or to enumerate the usual sources from whence gold is obtained now. Suffice it, for our purpose, to admit that the very first thing a goldsmith needs is pure gold; not that pure gold can be worked, for it cannot. No really chemically pure gold was ever worked, or ever could be. Many ornaments of refined gold are mentioned by old writers, but in no instance have I found any record of any antique made of pure gold. Purity in this metal is represented by the number 24; standard gold has 22 parts pure to 2 parts of alloy; 18-carat gold has 18 parts pure to 6 parts of alloy. French gold, called 18 carats fine, is not so pure as the 18-carat gold used here; it only assays to 17 $\frac{3}{8}$, or a quarter of a grain worse than would pass Goldsmiths' Hall as 18 carat. The French gold is alloyed with copper, which gives it the reddish tinge. We alloy with both silver and copper, and no point has been more discussed and quarrelled over than the exact amount of silver and copper necessary to

make the best alloy. It is only 6 parts in 24—not much to wrangle about, you will say.

I will not attempt to give you all the formulæ, or to decide which is best, only, like everybody else, in one particular proportion of silver and gold I believe, and in no other; even when 22-carat gold is to be prepared, the 2 parts of alloy are matters for much comment and dispute. I know two really estimable men who quarrelled bitterly on this question; the one said that of the two parts one should be silver and the other copper, while the other stoutly maintained that the proper proportion was one and a half copper and half silver.

Well, the gold being alloyed to 22, 18, 15, 12, 9 carat, or even a lower quantity of gold, it is put into what is called a pot and melted on a furnace. This furnace can be heated by gas, by charcoal, or by coke; it could be by electricity, but the application is not sufficiently perfected to be used for a goldsmith's furnace yet; however, it will, I hope, be so soon.

When the gold is absolutely fused—and the greater the proportion of gold in the mixture the greater the heat required to fuse it—it is poured into a mould, called a skillet, and allowed to cool; when cold it is ready for flattening, which is done by rolling it between two heavy steel rollers. It depends on the intended use how thin the metal is rolled. There are gauges for this, like those for wire and sheet metal.

If the gold is wanted for gem rings, it is left thick and cut with shears into slips. I mean for good work. For common work done in Birmingham and Sheffield (and I am sorry to say in London too), the settings for the stones are stamped out by machinery, and the claws bent over the stones, instead of, as in the best work, the claws being cut to the stone. The goldsmith will, for himself, further flat the gold in small mills if it be necessary for his work. He will also fuse small pieces or cuttings into the shape he desires on what he would call "a coal," really a long piece of charcoal hollowed in the centre, for the very old terms are still used in workrooms (charcoal was called "coal" long before "sea coal" was burnt in the chapter-house at Westminster, where the first fire was made of what we now call coal of which we have any record; but this by the way).

Having arranged his gold in the rough, the workman proceeds to hammer it more nearly into the required shape. If it be for a ring with stones in it, after he has fused a thick mass for the head he hammers a long straight piece (cold work, you see), then with his pliers he bends it round to get it roughly into shape; then he files the inside to get it smooth enough to make it the desired size to fit the finger; it is then filed and scaupered into shape, carved and clawed. The ring is soldered together at the back, it is polished with sand-paper, with "water air stones," which look very much like slate pencils, and with hard wood. The little claws are "threaded out," i.e. polished with whitey-brown thread, on which a little rouge has been rubbed. So far all work goes through these processes, whether it is to be finished bright or coloured; the last thing done is setting the stones.

Now, you will perceive that the gold was alloyed and melted into an ingot; so far heat was used, but for the flattening no fire is necessary. Tradition—and all tradition has a basis of truth—says the gold the ancients made the ornaments for the dead from was beaten into the thin plates from which the wreaths, &c. were cut between thin layers of leather and with a very heavy hammer. Gold-beaters now beat their gold between thin leaves of vellum. The thin gold used by the ancients for their funeral ornaments was of the same degree of fineness as that beaten now, which has about one part alloy, either silver or copper, to twenty parts of pure gold. The alloy diminishes the malleability, so the inducement is only small to deteriorate the quality, for gold leaf is sold by size, and not by weight.

Now the gold is cast into oblong ingots, about $\frac{3}{4}$ of an inch thick and wide, and each weighing about 2 ozs.; this is flattened into a ribbon about $\frac{1}{2000}$ th part of an inch thick, then annealed or softened by heat, and cut into pieces about an inch square; 150 of these are put between vellum, each piece of gold in the centre of a square of vellum; and another added, until a pile of 150 is made. This pile is enclosed in a double parchment case, and beaten with a 16-lb. hammer; the elasticity of the packet lightens the labour, as the hammer rebounds with each blow. The beating is repeated until the inch pieces are spread out to 4-inch squares; they are then taken out, cut into four pieces each, placed this time between gold-beaters' skin, and hammered as before, but this time with a lighter hammer; they are again quartered and again hammered, thus producing 2,400 leaves, having an area of nearly 200 times that of the ribbon and a thickness of $\frac{1}{200000}$ th of an inch.

The soldering of the ancients was something very marvellous. Castellani is of opinion that, so far as goldwork was concerned, they were better chemists than we are, and used solvents with which we are unacquainted.

The delicate grainwork with which the Etruscans covered large surfaces is not easy to imitate. Here is a little piece

* A paper read by Mrs. Philip Newman at the meeting of the Applied Art Section of the Society of Arts.

roughly done as an illustration, but there are few men who can do it now.

For a long while after the Etruscan gold-work came to light it was found impossible to copy the colour of the gold, but now we can get it exactly by putting the proper proportion of common salt, saltpetre and alum in a flat-bottomed pot with distilled water, and heating to 212 deg. Fahr. This mixture is not pretty to look at, for it boils up a pale, sickly, greenish colour.

The gold-work to be coloured should not be of less than 18 carats fine. It is hung from a platina ring with either platina wires or horsehair: there should be plenty of it, for the greater the amount of gold to be coloured the better the colour of each article. The work, having been properly cleaned, is dipped into the boiling mixture, taken out, dipped into clean boiling water, dipped into the colour pot again, again washed in hot water; about the third dip the rich bloom of colour comes. Much more washing is still necessary before the work is ready to dry in hot boxwood dust, after which it is scratch-brushed. Here is a scratch-brush: the hole in the centre fits on to the mandril of a foot lathe; the article to be finished is held against the revolving brush in the hands of the workman. Now, nothing is so good to feed the scratch-brush with as beer; this drops on the revolving brush from a little hole in a small tub fixed over the lathe, so that the beer drips on the brush as it revolves.

If this scratch-brushing is done by a clever operator, 18-carat gold has the beautiful bloom of the best Etruscan work; this is the very reverse process of gilding, for in gilding pure gold is added to and spread over the surface, while in colouring the alloy is eaten from the surface, leaving only pure gold visible. We know that the Japanese derive some of their ideas from the most crystallised of all old time peoples—the Chinese. Shall we ever have a more intimate acquaintance with their inner life and their old traditions, and find out whether the Japanese “pickles,” as their colouring mixtures are sometimes called, are made from early traditions of the craft—traditions of the knowledge emanating from the Hindoo Koosh, but lost lore to European nations? As to the processes by which the result was obtained in the old work we have little to aid us; but we may safely say that whenever the work was done in prehistoric times, in Egypt, in Assyria, in the cities of Italy occupied by the Etruscans, in Greece, in Rome, or nearer our own time, in Florence, it was not the working that was so very different from our own, it was the almost intuitive feeling for art that made the gulf between the goldsmiths' work in the past and to-day.

In very early times mechanical aids to repetition were adopted; the Greeks used dies for the little amphoræ they were so fond of hanging round their necklaces; no doubt, also, they made cutters for the pateræ so often seen in Greek and Græco-Etruscan work. I do not suppose they had any better equivalent for a monkey press than a sledge-hammer, but they had that. Yes, the old craftsmen beat, flatted and annealed their gold; they drew wire, they twisted it, they screwed it, they did *repoussé* work, they engraved the most beautiful intagli on their gold rings, they knew how to prepare their work for the inlaying of stones, of which enamelling was only an imitation, and in the earliest times they understood Cloisonné and Champlevé enamels. At the present time all these things are done, but we do not often have artists to make the dies, and we depend too much on the dies; it is the curse of cheapness that spoils our work. Now necklaces, brooches, bracelets are made by the dozen, all alike. It spoils the work, and it spoils the workers, for instead of a man being able to make all usual trinkets right through himself, it is found cheaper for a foreman to give so many articles, all to be alike, to one man, who takes so many boys under him. These boys are only taught to do one portion of the work, some only learning to make snaps, others only joints, others only tongues and catches. In after years what is to become of these lads? The men who teach them can only make one thing; a brooch-maker can only make brooches, and so on, and of the separate parts of that thing he teaches so many boys to make one part only; not one of them could put them together from anything taught in their factory, and but few lads have the wish or the application to learn more than they are taught. No, it was a better time when the old system of apprenticeship prevailed, and it was to the master's interest to teach a boy to be a thorough good workman. When the goldsmiths who have been apprenticed are all dead and gone, where will the craft be then? The boys “taken on” will not be of any use; indeed, many of them now, finding it impossible to get their bread with the knowledge they have acquired, go for soldiers, so the little they have learnt is lost.

If technical schools would only supplement proper apprenticeships instead of attempting to be a substitute for them, they would do much good. Reading all about an art for a year is not so useful as working with others who know and exercise it for a month. Practice is necessary, has always been necessary, and will always be so. There is no art, craft or trade where constant practice is so necessary as that of a goldsmith. I know of several goldsmiths now whose technical work is quite

equal to that of the best periods, but they have not only served their time, but have lost no opportunity since their apprenticeship expired of learning more about their work. Such goldsmiths are becoming more scarce every year.

In old times, in all ages and in all places, there were two separate and quite distinct branches of goldsmiths' work. In the one case, the work done for the temples in honour of the cult of the people; in the other, for the houses of their chiefs and kings, and for the adornment of their women; but it seldom happened, until at any rate comparatively recent times, that the secular work was done by the same craftsmen as the work for religious purposes.

In the early Christian times there was little sacred art at all, the sect was too poor and despised; but, as Christianity gained noble and rich converts, and the Church became a power, it was only natural that their places of worship should become more magnificent than the heathen temples had been; and that much of the gold and silver of the temples should be melted up and remodelled for the service of the Church.

How far back guilds of workers in gold can be traced I am sorry I cannot tell you, but we must suppose that the Aurifices of Rome formed a sort of corporation, for they erected a little triumphal arch in honour of Septimius Severus in the Velabrum; this arch does not bear any characteristic mark of goldsmiths or their work.

In Rome I have seen ancient inscriptions bearing these words, “Aurifex Aug.,” “Aurifex Augustæ,” “Aurifex Tib. Cæsaris,” “Aurifex Liviae,” &c. The inscriptions prove that in and after the times of Augustus and Livia, emperors and empresses had goldsmiths in title attached to their service; similar inscriptions to these have been found in Britain, I believe.

The Gallic people have long traditions as goldsmiths, for records remain of goldsmiths in Limoges before the invasion of Julius Cæsar. The name of only one Gallo-Roman goldsmith has been preserved; it was Maburnius; he is mentioned in a will of the fifth century. Perpetuus, Bishop of Tours, left the silver cross he used to wear and some other trinkets to a brother bishop, because he leaves the gold cross, &c. made by Maburnius to his church.

There were, and I hope still are, in the Cabinet of Antiquities in the Bibliothèque Nationale, Paris, the hilt of a sword in gold, gold bees, and other objects found in the tomb of King Childeric at Tournay, all of beaten gold.

One of the apprentices of Abbon, at Limoges, a youth named Eloi, was afterwards one of the patron saints of French goldsmiths. St. Eloi, in his early days, was ordered to make a seat for the king—whether a saddle or a chair has never yet been quite decided—but he worked so diligently, so carefully and so honestly, that out of the gold entrusted to him he made two seats without either being in any way defective, and he made the two in the time he was expected to make one; small wonder that he became minister to Dagobert I., called “The great.” Still, in the midst of all his grandeur and power, he worked as a goldsmith with his own hands, only assisted by his apprentice, Thillon, a Saxon.

In the time of St. Eloi there were three grades of goldsmiths—masters, companions and apprentices. St. Eloi founded a monastery at Solignac, where he taught the goldsmith's art to his monks. After the death of his master, Thillon became abbot, and continued the teaching of the craft. St. Eloi also founded a convent in Paris, on a large piece of ground given him for the purpose, near where the Palais de Justice now stands. It was known as the Maison de Madame St. Aure (Aurata), from a virgin that came to Paris from Syria preaching the Gospel in Hebrew to convert the Jews. Perhaps she was chosen as first abbess on account of her name, for St. Eloi had his favourite art taught here also, and the convent became the centre for gold embroidery for Church work. The nuns were celebrated, not only for their exquisite work and the beauty of their designs, but also for the excellence of the gold thread they manufactured, which was purchased from them by all the world. The old accounts of this convent rather lead one to suppose that vessels and crosses for the service of the Church were also made here; but I am not sufficiently sure that the nuns made them, to cite those nuns as women goldsmiths.

In Paris, during the reign of St. Louis, strangers were allowed to work as goldsmiths, after they had lived for a year and a day in the quarter of the Pont au Change or Grand Pont. If they were approved as craftsmen and good fellows—for all this time they must have been under the observation of the masters of the craft, who certified them to be respectable men and good workmen—they had to pay a tax to the king, according to the value of the custom they had; there was one Richardin, the enameller from London, who paid an impost of 3 sous; Robert, the Englishman, who paid an impost of 12 sous; and many other names of foreigners are recorded as having practised the craft at that period in Paris.

In the eleventh century the monk Theophilus, who wrote on many arts, wrote a treatise on gold-work, which, when all the odd superstitions about the preparation of gold are elimi-

nated, evinces a knowledge, and a practical knowledge too, that would be hard to excel now.

Theophilus, whoever he was, and from whatever country he came (for these two details are not recorded, and the theory that he was of English birth never has been either proved or disproved), was a thorough master of all branches of the art; and a translation of his work will do more to help an amateur in his studies than any of the so-called technical hand-books ever written.

The treatise commences by describing how the factory—*fabrica*—should be built. He recommends that it should be large and spacious, should have a wide window with a good light; he directs that there should be planks put round the table where the workers sit to catch the pieces of gold that may fall in working. To the left of the worker a furnace must be built of well-kneaded clay. He must have bellows, anvils, hammers, pincers, nippers, draw-plates, screw-plates, files, irons to scoop out the gold, to scrape it, to grave it, and to cut it. These "irons" are the great-grandfathers of our scrapers, split stickers (*spelzsticker*), bull stickers, &c., used now. He does not mention "skins," always attached to the board nowadays, but probably the workers then wore leather aprons, which answered the same purpose.

This monk knew all the ordinary work. He tells how to begin and to finish cups for the altar, niello work, enamelling and almost all the details of every branch of the craft; and all that he describes he did with his own hands, even to the building of the furnace. How many craftsmen are there who could do this now? Many of them can only do one thing, and that indifferently well.

Theophilus taught that a lad must be apprenticed for not less than eight years; then that another term was desirable, and that if all that could be learnt was to be acquired, a further term of pupilage must be spent to make a first-rate master. Theophilus contended that it was necessary to be an apprentice for twenty-one years. In the Bibliothèque Nationale there is an engraving of Etienne Delaulne's workshop, done by himself. Etienne Delaulne was better known as "Stephanus." This engraving has been much copied and the copies much used; it has even come down to be a frontispiece in a retail trade catalogue, but it is so very interesting that I asked my husband to prepare a slide for me from it, in order that I might point out to you the resemblance between a factory some five hundred years ago and one of the present day.

The Dictionarium of Magister Johannes de Garlandia gives some quaint accounts of customs in the trade, such as the rule that no master should be permitted to take a new apprentice before the one already bound to him was half out of his time, and that no master goldsmith should be permitted to take more than one outsider as an apprentice under any circumstances (by an "outsider" he means a lad the son of a foreigner, or of a father who followed a calling other than that of a goldsmith).

The author of this Dictionarium was of the noble family of Garlande; he followed William of Normandy into England. Both John Garlande and his Norman master were great patrons of the art; and I think Garlande could hardly have written as he did unless he could have worked himself, as well as describe the methods of work.

In all that concerns our subject the English were never far behind; there are Saxon jewels of great interest in the British Museum, and in the Ashmolean Museum there is King Alfred's jewel, a drawing of which will be shown presently; at any rate the commercial spirit of the English was always manifest. It is related how English treasure helped the Abbé Suger out of a great difficulty. I should remind you that the Abbé Suger was Abbot of St. Denis and minister to Louis VI. in the twelfth century. Suger had prepared a magnificent gold crucifix and other ornaments for his abbey church, but for a long time after they were ready he could not obtain the stones he required to finish them, until when he began to despair three monks from England came to him to sell the jewels removed from the table cups of our Henry I., jewels that the king's nephew, Thibaut, Count of Champagne, had given to various convents to procure indulgences and prayers. How the jewels came into the hands of these three monks I am unable to tell you, but history says that the Abbé Suger bought from these men, for a sum equal to 400*l.* of our money, jewels that were at that time of priceless value. The crucifix was melted in 1590 by the Leaguers.

In the eleventh and twelfth centuries much gold was used in the manufacture of cups and decorations for sacred purposes; probably that is why so few of them remain now.

The gold on the Paliotto executed for that very interesting church in Milan, St. Ambrogio, by the goldsmith Wolvinus, was valued at 280,000 gold crowns; it is a most beautiful piece of goldsmiths' work, enriched with camei and intagli, precious stones and enamel. Quintilian justly observes, "*Ars summa materia optima melior*," and the value of the exquisite design and arrangement of this work is far above the value of the material employed, yet the value is, in this case, so far above price that there is an additional reason for being glad it is still preserved to us. Count Balzani told me how nearly it was

lost when Milan was entered by the famished soldiers of Napoleon, and how it was saved by the adroitness of a priest, who knew that a small portion had either been stolen or lost, and that the vacant space had been supplied with a good imitation in copper gilt. This little accident was only known to a few of the priests, the outer world knew nothing of it. When the soldiers entered the church the priest advanced to them, asking what they wanted. He was rudely answered, "The gold altar case and the gems set in it." "Alas!" he said, "would that we had a gold altar, its value would supply the wants of many; it is this gilt Paliotto," he continued, "that you must mean. Look! I will show you the gold." And he coolly broke away the restored copper gilt portion, saying, "Do you think, if the gems ever were real, those here now are better than the copper? No, poor fellows, it is not in this bare, half-empty, poor old church that you will find treasure; go seek it elsewhere." And they went without touching the Paliotto.

There is much to be said about art of the kind in our own and other countries, but there are some illustrations to be thought of, and, with your permission, they shall now be shown and described.

The paper was illustrated by a series of lantern slides, taken from fine historical examples of jewellery in the Gold Ornament Room of the British Museum, and other great national collections.

COLOUR IN STREET ARCHITECTURE.*

(Concluded from last week.)

THE colours of terra-cotta when used sparingly in a front certainly tend to enliven the inevitable dreariness of the brickwork with which it is customary to use it. I am strongly of opinion, however, that it is a great artistic mistake to use the material for the whole exterior of a building from plinth to chimney-top, or even for wall surfaces of any extent. Of the many terra-cotta colours in general use the reds, on account of their heaviness and density, are, in my opinion, the least satisfactory. Although great strides have been made in manufacture since the Constitutional Club was erected, a more uniform shape and tint having been obtained, yet the general effect of some of the last examples we see around us are worse than the first. A new colour, technically termed chestnut buff, is pleasing in tone and in tint, is one that would harmonise well with many natural red brick colours, but I am unaware of any instance of its use in London. The pinky buff and golden browns are certainly the most pleasing tints when properly used; but, alas! the beauty in this, as in much else, is stated to be fleeting.

It may be instructive to examine a particular example of the application of the material under consideration. The Natural History Museum at South Kensington, by Mr. Waterhouse, is unquestionably the best instance of its use that could be taken for review, as reliable criticism of the colour effect in this building would be of a standard value from the fact that any conclusion arrived at could not well be modified by the chance of a higher perfection of manufacture being attained in the future. Although, as I have said, terra-cotta appears to be unsuitable for any work of a monumental character, from many points of view the Museum is a very beautiful building. The great satisfaction that one feels on contemplating the design, however, is qualified by the startling cleanliness and freshness in the broad surfaces so long after completion. These characteristics, it must be allowed, are not the constituents of artistic repose in colour. One is therefore led to the inevitable conclusion that the satisfaction experienced arises from the fine architectural conception and beautiful detail rather than from the colour effect. In support of this conclusion we further notice that the upper parts of the composition, the top stones of towers and pinnacles, and particularly the series of gabled dormers, are aggressively bright in tone, clean and fresh as when first built. The general surface of the façades, sheltered by the main cornice, are of an absolutely uniform tint, of a lower scale than the parts first mentioned, while the series of recessed windows under semi-circular arches are strongly emphasised by a visible layer of dust and soot obliterating the colour. It is this palpable uncleanliness in the sheltered parts of terra-cotta that is so objectionable, whilst the exposed portions have a bizarre effect. The eye wanders over the composition, seeking in vain the repose of one weathered block, and we leave the scene with an impression of a bold beautiful design wrapped in a mantle of a monochrome striped with bluish grey, and, perhaps, repeating the lines of Byron:—

So coldly sweet, so deadly fair,
We start—for soul is wanting there.

One could hope that some note of the probable appearance of this building, say, a thousand years hence, might be handed

* A paper read at the Architectural Association on March 2, by Mr. S. B. Beale.

down to posterity, to meet the eye of Macaulay's New Zealander when, in the ages to come, he takes his stand on a broken kerb of the Exhibition Road to sketch the ruins of the Imperial Institute, to the exclusion of the Museum as too new-looking to be noticed.

Coming next to the Constitutional Club in Northumberland Avenue, it would be ungenerous to be strictly just in expressing an opinion, for the club is without doubt a hopeful spot in the surrounding gloom. We do not see the vivid freshness of the Natural History Museum, instead a precipitate of grime, not in sheltered portions only, but all over the composition, and still an absence of any pretence of weathering—making one long to take a broom and clean things up a little. Terra-cotta fronts in busy thoroughfares stand in urgent need of an annual spring clean.

Much the same criticism applies to the French Church, in Soho Square, as to the Natural History Museum, on the score of an absence of reposeful weathering in the material. The street front impresses me as particularly hard and unsympathetic in tone, but, needless to say, very clever in design and detail.

The restrained application of the material to dressings by some architects of eminence does not lay terra-cotta open to the same strictures as when used for general wall surfaces. Some of my remarks on the colour effect of this material may appear hypercritical in view of the improvement its introduction, when sparingly applied, has made in London street architecture; but I have considered the material *per se* and have confined my review to the best examples extant. There are specimens in Oxford Street and Piccadilly Circus that exhibit colour effect in terra-cotta to be infinitely worse than anything that stock brick or bad stone has ever produced. I have examined the material at its best and at its worst, and have come to the conclusion that the colour effect of terra-cotta after fifteen years' experience has brought the problem of dispelling the gloom in London street architecture no nearer a solution.

Having now critically reviewed the colour effect of some of the possible and some of the impossible materials seen in our streets, it will be gathered, I think, from the foregoing that I hold the view that not one of these materials as now used do much to brighten town existence. How can improvement be effected? First, I think, by revolutionising the almost universal practice of designing cornices, window-heads, strings and labels, with the idea of throwing the rain off the surface of the building, of sheltering a great portion of it from the action of the wind, and preventing the sun shedding its gentle influence upon the composition. This change, however, will not entirely prevent the deposit of soot and dirt on the most sacred portions of the fronts. If we are to obtain the best weather effect possible, and in a measure retain the self-colour of building materials, all parts must be designed so as to allow of the surfaces being exposed to the full effects of the elements.

As to the treatment of wall surfaces. The rigid requirements of light for the interior prevent the arrangement of much breadth in colour effect. It would seem then all the more necessary that the flat surfaces that do remain to us after the window space is allotted, should not be further broken up by arbitrary variations in colour and material. The least unsatisfactory specimens of architectural colouring are to be seen in fronts that are either all stone or all brick throughout.

The monotony of the London street in form and colour would be greatly affected if the roofs of buildings were designed so that a greater portion of them than is visible at present could be seen in the long perspective of a thoroughfare. The roof material keeps its colour and weathers better than any other part of the building.

Green tints of slates and the reds and browns of tiles, if more in evidence above the cornice or parapet, would do much to brighten the scene. The introduction of a single gable here and there is an excellent means of showing a flank of the roof, but the repetition of French, English, Dutch and Flemish samples all down the street effectually shuts out all roof colour from view.

There are many other details that would suggest themselves in working out a design if the central principle of arranging every part so as to allow of fullest exposure be kept in view. If this were done an improvement would soon be seen in the colour of the London street, although the effect would be far from what it might be, so long as ordinary building materials, as generally used, remain the medium for architectural expression. There would still remain the deleterious effect of narrow thoroughfares and cramped surroundings. The real problem to be solved resolves itself into the question, Is there a material suitable for use that will retain its colour or even present a semblance of pleasantness in a town atmosphere for a lengthened period of years? The porous and impressionable bricks and stones will not, and of terra-cotta my observation tends to show that unless highly vitrified its colour is marred by the visible coating of dust and soot, which in any case neither weathers into the material nor is washed off by the

rain. The more extended use of a glazed material then seems to me the only likely solution of the problem; but before our salvation comes from this direction a huge barrier of prejudice will have to be beaten down. The discussion to-night could not take a more useful turn than by examining the nature of these strong prejudices, to see how far they are based upon reasonable grounds.

In the first place, prejudice may arise from the fact that the ancient past has no precedent to offer to the use of glazed materials as we would use them. If it could be found in our Ferguson or Gwilt that such and such a basilica was so faced so many hundreds of years ago, London would be a bright and cheerful city to-day. The natural surroundings of the monuments of architectural antiquity did not demand an impervious facing to preserve their colour effect, and such materials were not used. If there is one thing more than another that the builders of old were particular about, it was the designing of their architecture to meet the needs of each particular case. It appears, then, as practical architects, if we would be strictly archaic, that our mission, as far as colour is concerned in London, is to design to meet the requirements of a dull and disintegrating atmosphere, and not for the environment of a bright and sunny clime.

Prejudice, again, may arise from the objection that glazed work is an unreal and unarchitectural material; as to the unreality, it is advanced that the material is not throughout all its parts the same as it is on the face. The glazing is stated to be an artificiality and a sham, a superior facing to a baser backing. I will not wade into the ethical reasoning that this statement provokes, as it might be difficult to get back into the shallows again; but I will say that to assert that any one material created for the use of man is in itself better or worse than another is saying that which cannot be supported by any logical process of reasoning. One material may be more useful in one set of circumstances than in another, but that is no criterion of the actual intrinsic merit of that material. The mere commercial value placed upon a commodity by the manufacturing and trading instincts of a community never can be a true standard of relative value of one material to another. If this reasoning is correct, it is wrong to say that a glazed material is a sham.

As to glazed work being unarchitectural, 'I will be content with the statement of the general principle that all materials within reach of architects that promise to serve the needs which call for their use are, lock, stock and barrel, architectural materials—whether Solomon of old or Jones of to-day has or has not used them.

So much for the objections prompted by sentiment. What are the practical arguments against the use of glazed work in the externals of our architecture?

First, the difficulty of treating the material successfully from the artistic standpoint. This I admit as a most real objection, but one that would vanish on the growth of familiarity with the possibilities and limits of the material. A bad design in glazed work is very bad. The effects presented by a large restaurant in Oxford Street and a small one in Buckingham Street, to the latter of which our President can testify, in themselves are enough to ruin the chances of a successful advocacy for the general introduction of this material for a long time to come, and the kindest thing to be said of these two instances is that they were experiments in a little known material. On the other hand, the example of Great George Street exhibits, I think it will be agreed, a very successful application. This is not an exclusive application, but it sufficiently indicates that the material in the hands of a capable designer gives a very pleasing effect. One drawback, namely, the play of light on the glazed surface, is not a serious one, for it is only seen from positions at very acute angles to the point observed, and as this position on looking up is two or three feet away from the base of the front, or on viewing sideways half-way down the street, the play of light does not obtrude; these positions, moreover, are not such as one would generally select to examine the colour effect of any front. More than this, the inevitable film, of which it is impossible to be rid, although very slight, is after a time sufficient to neutralise the play of light on the surface.

I would ask your attention for but a few moments longer for the purpose of following more positive reasoning in favour of the use of glazed work in architectural exteriors. Its extensive use for internal decoration in areas and in other positions where light and cheerfulness are required is sufficient justification, if any further is needed, for its unqualified use in street fronts. If I mistake not, the glazed decorations, whether as tiles or bricks in casings to columns, in panels and mouldings used as it has been in many of our largest clubs and public buildings, not to mention public-houses, is there to please the eye and cheer the spirits, and well it does this, too. Then why, in the name of common sense should the front-door mat be the uncrossable barrier that prevents the legitimate use of glazed work on the street front?

The application of glazed work to mouldings and enrichments is as suitable for external as for internal work, and, from

the maker's point of view, quite as practicable. The capabilities of the material would demand simple and dignified treatment rather than elaboration; and I am assured on inquiry that there is no practical reason why every part and detail of a front should not be built in glazed work. I do not think this exclusive application would be the best artistic treatment, but it is possible.

Assuming that the general use of glazed materials has come within the scope of practical politics, can we obtain that range of quiet, subdued and pleasant colours without which we shall not improve on the present condition of affairs? I will not say that the tints now in use are all that could be desired, but an intelligent demand would create a better and more varied supply. The white variety of glazed bricks might be considered too cold for artistic effect. Delicate cream colour, on the other hand, would appear suitable. A nice specimen of this tint may be seen in an unclosed internal area of the new Admiralty extension visible from Spring Gardens. Facework of this colour, with terra-cotta or stone dressings as a compromise, would, I think, make a pleasant combination. A very wide field for good and original treatment is opened by the choice of light and dark reds, golden browns, and other much less conventional colours.

It is too much, perhaps, to expect the older hands in the profession to be the pioneers in the field of glazed work. It is to the younger men, whose aspirations are not bound down by the iron bands of use and tradition, that the colour of London street architecture must look for its salvation. Unfortunately it is the experienced who would be the most capable of showing the world how glazed materials could be most successfully treated, and that they can be so treated already we have some visual evidence. But as in all else, I suppose we shall learn most by the failures. Sufficient evils must be choked in the weir before the live ones can slip over, and it will be our fate if ever glazed materials come into general use to experience many shocks before the eye will drink in satisfaction from a vista of good, cheerful harmonious colouring in glazed materials.

If the remedy for the present dismal colouring in the London streets does not lie in the directions I have indicated, and we would do our duty as a body of architects to our clients and to the community at large, the subject must be pursued further, until a remedy has been found that will enable us to bequeath to the generations to come a brighter and more cheerful city than it has been our lot to inherit from the architects of the past.

Mr. CRACE proposed a vote of thanks to Mr. Beale for his paper. One or two doubts had been left on his mind. He was not quite sure whether Mr. Beale advocated weathering or not. Weathering would not take place on glazed exteriors, though soot might dirty them. Half the colour of buildings was due to the kindness of nature, which, after the hand of man had done its best—or worst—came in and helped to put the building right. Though the London atmosphere was extremely destructive, we were not altogether losers. No one could pass St. Paul's Cathedral without being struck by the colour. He did not agree with Mr. Beale in recommending glazed exteriors. Mr. Beale had spoken of there being a prejudice against them which would not have existed if their use in ancient times could have been shown. In regard to stucco, that as a material belonged to antiquity. In this country architects had too often used stucco to represent some other material. If rightly used it was quite possible to colour it judiciously. Mr. Crace alluded to the premises of Messrs. Novello in the City, and the Alhambra, Leicester Square, as it was two or three years ago. Anyway, it must not be believed that their only salvation was in glazed work. Mosaic might be used on a large scale with good effect for friezes, courses, &c. Spain had been referred to. It was a bright and hot country, and bright colours would not be garish. In London, on the contrary, flags and bright colours under a cloudy sky produced garishness and want of harmony.

Mr. J. WALLACE RIMINGTON said he could not agree that any danger lay in having too much colour in this country, as he considered a northern clime could stand as much colour as a southern clime. In many cases effects of colour were created by reflection—technically speaking, by reverberation—though in reality there was actually little colour in the buildings. Mr. Beale, he thought, had been rather hard on terra-cotta. He agreed with Mr. Crace, however, that there was a legitimate field open for the use of paints, and that pigments might be used with success and employed to great advantage. It should be broken up—a certain amount of inequality or vibration obtained throughout the whole work. Much of the charm of old work was owing to this inequality in colouring. Mr. Rimington then alluded to examples in Toledo, Cordova, Seville and other cities in Spain, also to the Moorish examples in Granada, as to the good effects of irregularity in colouring, whereas modern work tended to too much regularity. In the best works colour was not applied so much in the highest lights, but rather reserved for the half-tones, and the

greatest richness kept for the dark lights. The deduction he drew was that colour should be employed in the shadows, and be sparingly used for the light parts.

Mr. E. W. WIMPERIS was not in favour of glazed work, though he advocated the use of colour. That Mr. Halsey Ricardo's building was charming in spite of a certain amount of glaze he admitted. He advocated more breadth of treatment in such buildings as the Natural History Museum. He was pleased to hear Mr. Crace's opinion that stucco could be used in a proper way, and lend itself under that condition to colour treatment.

Mr. CARÖE thought that London would be terrible if it were periodically to become a great washhouse, with fire-engine hose playing on buildings to wash the soot off them, and he thought Mr. Beale had got on a wrong tack in advocating glazed exteriors. He agreed with Mr. Wimperis, that both breadth and design was wanted for colour to be effective. Little bits were not desirable. Somerset House was a charming example of colour by weathering. As to Portland stone in London, no material weathered better. He certainly did not advocate the use of terra-cotta, a hard, unfeeling, soulless material that did not weather.

Mr. HALSEY RICARDO, being invited to speak, said that in clear atmosphere Time worked on the architect's behalf, flinging a brood of texture and colour over his work, but in manufacturing towns Time's hand was against the architect, and, with Time's permission, the corrosive gases of the atmosphere gnaw into and devour his building. Stones and bricks that were fortunate to weather themselves a century or more ago, when the air was purer, acquired then a face of flint which to-day defies the biting venom of our air, but we could not hope to build under such conditions. If, then, we were denied texture, we are driven with all the more force upon light and shade and colour. But, as Mr. Beale had pointed out, there were strong reasons against getting our shadows by projections. But by colour we could get the effect of shadow. Colours in English cities, where the light is dimmed by the smoke from manufactories, should be rich and full. Abroad, where the sun shines fiercely, we could use garish colours, because the glare of the sun and reflected lights gave gradation and modulation to crude tints, and the deep defined shadows produce supplementary colour harmonies. We were used to full rich colours. Our landscape is so, compared to the prevailing grey, dusty, pale landscape abroad. Bright light blanches colour; the time when colour is at its fullest and finest is in the gloaming. Absence of colour is felt by the most ignorant to be a want in our streets. On festivals our first impulse was to provide it by means of flags, streamers and flowers. What an animating spectacle was a troop of red-coats passing through the streets. One's pulse beats one hundred more to the minute. In the coming happier days let us hope that we may see carnivals in scarlet strutting with peacocks in every square, and squads of soldiers in uniform marching down our thoroughfares, and the Lord Mayor in his gilded barge and with his glittering retinue taking his daily stroll up and down the Thames. If we used colour we need not use mouldings. We can get our shadows and half-tones direct. Stone carving, stone, brick or terra-cotta ornamentation and mouldings were a mistake in a city like London. They were bound to perish miserably in the corrosive acids of our atmosphere, and whilst undestroyed are rendered ridiculous by the deposit of dust and grime. Mr. Beale had argued that, accepting the nineteenth century and the geographical and commercial position of London, glazed surfaces were what we should adopt. So he (the speaker) thought. Using them we renounce texture and the softened harmonies got by the lapse of time. But, as he showed, these were virtually unobtainable, no matter what materials we used. But with glazed surfaces we got colour, warmth and cleanliness. A brick house was a house built of sponge-cakes; the wind whistles through it, and after each rainfall some tons of water have to be vaporised before we could get our walls warm. Glaze the outside and we were windproof and wetproof. He did not know whether disease germs cling to brick walls—they probably did—but their attachment to a glazed surface must be more precarious. With glazed bricks, glazed terra-cotta and tiles, we had a most gorgeous palette to our hands. In one's musings of what one means to do in the blessed future, when patrons were trustful, and the fear of the contractor was removed from one's eyes, he saw rise before him the home of his ambition, like an opal in the sunshine, covered from basement to eaves with tiles of De Morgan's richest hues, and this jewel of a house repeats itself in shimmering radiance adown the street and space through the avenues of the New Jerusalem itself. Harmony was spoilt by repainting. Thirty per cent. of the wall front was window, so that the objection of the play of light was not serious. Windows were cleaned oftener than the house front.

Messrs. Pratt, Earle, Bannister Fletcher, Satchell, W. H. White and C. H. Brodie supported the vote, which was put to the meeting by the President and passed by acclamation. The proceedings then terminated.

KNUCKLE-BONE FLOORS.

AT the last meeting of the Oxford Architectural and Historical Society a paper was read by Mr. Hurst on the remains found in the excavations for the town hall and on the bone floor at Holywell. Concerning the latter he said:—

The discovery of a very fine example of what in Oxford is called a "knuckle-bone" floor, which fortunately had two dates upon it, attracted some attention in October last among our architects and antiquarians. Yet perhaps not quite enough, for the history of the Queen Anne style, supposing it to be such, will never be complete till a little more information is obtained regarding these Turkey carpets of the late seventeenth and early eighteenth centuries. Judging from the hundred-weights of bones thrown into back streams and into disused gravel-pits around Oxford, and from the fact that a wall of horns existed at Eynsham about forty years since, we may regard bones in those days as superfluous material, one ready to hand or purchasable for a song. The "rag-bone" man who now yells along our streets had clearly not come into existence, and the sooner his uncivilised method of collecting is abolished, the more credit to our local authorities. Floors of this kind have been tolerably numerous, but now they seem almost matters of tradition, so that it may perhaps be worth while to describe a good example like the present ere all memory of them has passed away. The floor of the front room of No. 19 Holywell was about 16 feet 6 inches by 15 feet 6 inches, not quite rectangular, giving an area of 255 square feet, and containing, by a computation based on these large rubbings, 24,460 ends of bones, those next to the knuckle. Some one who knows a little of osteology will greatly oblige by saying whether that number is to be divided by 2, 4 or 8 to obtain the number of animals that contributed. The bones were halved and embedded, broad ends upward, in fine gravel, and when fixed in position a mixture of thin lime and finer gravel appears to have been floated over the whole to give solidity and keep the surface light in colour. Whether hob-nails and street dirt, or rough sand and a rubbing-stone were used to smooth the surface could not be decided. In one place, left of the hearth, the projections of the bones were left untouched. The surface, however obtained, was equal to that of Roman mosaic without the monotony of its square tesserae; it was pleasant to tread upon, not so cold as stone, and much more durable than wood. The workmanship generally was most skilful, but the south portion had at some time been disturbed or had been left in a rough state for after modification. The borders, letters and figures were of calves' bones or those of small oxen; the dividing lines were smaller, and the filling-in was of mutton bones or of lamb, and a few of deer. It was in the singularly compact arranging of the last of these, rather than in the plan or design, that the beauty of the floor consisted. But we cannot say that we have the complete design before us, since the room may have been wider to the right than at present. In the initials the "R" is most probably the surname of the occupier, and "W" and "E" the Christian names of the husband and wife. The dates, 1701 and 1702, are easily recognised. The only surname at all reasonable is that of Robins, but Edward Robins was lessee under Merton "in the thirteenth year of Charles's reign." It may, of course, have happened that the same family lived there till 1701, but the houses had changed their numbers, and there is nothing as yet certain upon the point. Mr. Frederick King has sent me word that the same house was inhabited about 1820 by the Pinfolds, and that when the renowned Durham ox (for which 2,000*l.* had been offered) chose to break its thigh while being exhibited at the second Crown Inn, in the Corn Market, John Pinfold was summoned to kill and dress it. We found the bone floor under another one of oak, and a beam which supported the oak boards had on it some painting of Charles's time, as it seemed from the medium used. These floors have a whimsical interest for all who admire Thomas Hearne, for it happened on a day when that "elegant scriptor," as some one else calls him, was deserted by sobriety, if scandal rightly reports, he knelt down and kissed an example of this bone floor existing in the Antiquaries' Hall, regarding it as a genuine pavement of the Roman period. Members may be amused and may be grieved to see what a sorry plight he was in on that evening, as he went to Edmund Hall with two supporters who were not heraldic. Antiquaries' Hall still lives in Skelton, but has disappeared from Hythe Bridge Street. Its site is now occupied by four tall shops lying between the two tenements occupied by a coach-builder, the first of which is after the third house on the left when Hythe Bridge and the little one to its west have been crossed. It is, I think, this little bridge which makes the seventh of those on the Botley Road. I have been told that these bone floors are, or were, abundant at Elstow, John Bunyan's native place; that there was one in the grammar school in Wantage Churchyard, destroyed about 1850; the former Bear and Ragged Staff at Cumnor, which stood north of the church, had one; the girls' school in Beef Lane, also taken up; four or more of the houses near the Hamel, St. Thomas's, demolished to make room for the model dwellings;

half bones enough to fill a sack were taken this winter out of foundations near the chapel of the St. Thomas's sisters in the new part of Hollybush Row. Beneath Logic Lane, where the old Kybald Twychen crossed it, a piece of this flooring was discovered when putting up a scaffold-pole, and a trotter-shop on the site of the St. Giles's parish room had a modern specimen. Between Broken Hayes and the canal there stands a roofless cottage, apparently of the seventeenth century, which is said to have a floor of bones remaining, but that is inaccessible. Lastly, the portion of this museum, where the staircase terminates, had a row of this work round under its walls, which seemed to be part of the original work (the museum was erected in 1685), but removed when a stone floor was substituted. It would give me much pleasure to hear of others, especially of dated specimens, like this one from 19 Holywell.

THE GHIZEH MUSEUM.

THE Cairo correspondent of the *Times*, writing on the 7th inst., says:—The Council of Ministers, after discussing the question of the future of the Ghizeh Museum, have decided against incurring the expense of 130,000*l.* for its removal to a building which, it was proposed, should be specially constructed upon a more convenient site, and in favour of expending 60,000*l.* upon rendering the present building fireproof. As in either case the money must come out of the reserve fund in the hands of the Caisse de la Dette Publique, it is hoped that the authorities will only grant it for the construction of a suitable building, and not for the patching up of the present one.

The late excitement in England over the simple suggestion that the temples at Philæ should be removed furnishes material for an amusing comment upon the power of mere sentiment over reason. Not a voice has been raised for the protection of the immense and priceless collection at Ghizeh, which represents the civilisation of Egypt from the earliest historical period, although it is housed in a building that would be condemned as unsafe for the archives of any town in Europe. The walls, staircases, floors and roofing are a mass of dry timber with flue-like spaces between, admirably adapted for creating a draught, so that if a fire broke out the entire building would probably be burned down within a very few hours. Yet Egyptologists seem indifferent to a commonplace danger such as fire, which may happen at any moment to a museum worth any number of monuments such as the temples of Philæ.

If it should unfortunately be finally decided to attempt to render the present building fireproof there will be increased danger of fire and great risk of robberies taking place during the necessary operations, as well as risk of damage to the collection from the falling-in of the wretchedly-built walls. A further inconvenience would be that the museum would have to be closed to the public for a period of two or three years. Egyptologists should bestir themselves if they care to save the splendid Ghizeh Museum from the danger of becoming any day a mere memory of the past.

In reply to the statement, Mr. Poynter, R.A., sends the following account of the action which the Society for the Preservation of the Monuments of Ancient Egypt has taken in the matter:—As long ago as June 19, 1889, when the removal of the museum at Boulak to Ghizeh was first proposed, the committee of this Society submitted a memorial to the Egyptian Government on the subject, from which I extract the following:—

"Considering the importance of the historical documents and unique works of art contained in the Boulak Museum, this committee, while recognising the urgent necessity of immediately finding another site for the collection . . . regard with serious alarm the proposed removal of the museum to Ghizeh. The manifold dangers which would there threaten the collection arise (1) from the fact of the palace of Ghizeh being constructed of combustible materials, which, if once ignited, would speedily reduce palace and collection to a heap of ashes without the chance of saving a single object; (2) standing alone and near the desert, there would always be danger of robbers breaking in and carrying off the valuable series of jewellery and gold ornaments. . . . The committee, therefore, venture to hope that, before taking a step which is open to the foregoing objections, the Egyptian Government will reconsider the question, and whether it will not be possible to construct a simple fireproof building in a more accessible position."

The answer to this memorial was that the Egyptian Government had "no observations to offer on the subject," and the collection was soon in process of removal. At a general meeting of the Society, on March 14, 1890, held primarily to express indignation at the recent wanton destruction of famous monuments on the Nile, the subject of the inflammable nature of the buildings was again referred to by Mr. A. Jervoise Scott and discussed. In reply to what was then said, Lord Cromer, in a despatch which the Marquis of Salisbury was good enough to forward for the information of the committee, states that, having received privately a copy of

the report of the meeting, he had written to Sir Colin Scott Moncrieff as to the measures being taken to secure the contents of the museum from robbery and fire, and encloses the reply which he received from Sir Colin Moncrieff, adding that, in Sir Colin's opinion and his own, "the museum is far safer now than it was in its old position at Boulak." Sir Colin in his letter details the measures which had been taken to secure the contents of the museum—one of them being to turn out Zobeir Pasha and his Soudanese troops, who had been sharing the palace in dangerous vicinity to what your correspondent justly calls "the immense and priceless collection" which had been brought thither from Boulak. On these letters being read to the committee at a meeting in May, a resolution was passed "that the committee are of opinion that the collection at Ghizeh is still in jeopardy owing to the nature of the building, and venture to express a hope that as soon as money can be found by the Egyptian Government a suitable fireproof building may be erected." On July 9 a further letter from Sir Colin Scott Moncrieff was forwarded from the Foreign Office stating "that the measures necessary to secure the Ghizeh Museum from all danger by fire or robbery are not being neglected," and giving in more detail the precise measures which had been approved and were being put into execution; and on March 10, 1891, we receive further assurances that the Egyptian Government will not have done all that it ought to do "as long as we have not preserved from the risk of fire as far as is possible all the parts of the palace"; and in the despatch enclosing this statement it is considered that "the best solution would unquestionably be to build a fireproof building especially adapted for a museum." The Egyptian Government, therefore, from "having no observations to offer on the subject," had by that time arrived at the conclusion which our Society endeavoured to impress upon them nearly two years before; and we have understood that want of money alone has hitherto prevented the Government from setting about the construction of such a museum.

EXPLORATIONS IN GREECE.

THE Athens correspondent of the *Times* writes:—With the return of spring the time has arrived for the resumption of the excavations carried out by the various archaeological schools at Athens. Next week Mr. Ernest Gardner, the director of the British school, will begin operations on a new site—that of the temple of Apollo at Abæ. This sanctuary was the seat of one of the principal oracles of early Greece, and is mentioned by Sophocles ("Edipus Rex," 899) in a passage which seems to imply that it ranked with Delphi and Olympia as an important centre of worship. The oracle was consulted by Croesus and Mardonius, and according to some authorities was even older than Delphi. The site of the temple was recognised by Leake; and the remains now visible, though probably belonging to a later restoration, undoubtedly determine the situation of the ancient structure, which was destroyed by the Persians. Many antiquities are said to have come from this site; and a promising indication is supplied by Herodotus, who states that the temple was richly endowed with votive offerings. In addition to the excavations at Abæ, researches will be carried out by the British school in Cyprus and Asia Minor. The American school will resume the explorations on the site of the Heræon, near Argos, which yielded results of the highest interest and value last year. The operations will be superintended, as formerly, by Dr. Waldstein. The French excavations at Delphi will be continued under the direction of M. Homolle. The difficulties with regard to the expropriation of the peasants who occupied the ground have been overcome, and the exploration of this most important site can at last be carried out satisfactorily. The researches prosecuted by the German school on the western slope of the Acropolis will be continued under the skilful guidance of Dr. Dörpfeld. The Greek Government has given liberal assistance towards the acquisition of the land; and the excavations, which will probably extend over several years, will settle many disputed questions relating to the topography of ancient Athens. Explorations at Hissarlik will also be carried out, the requisite funds being supplied by the German Government.

THE PROPOSED MONUMENTAL CHAPEL.

THE following letter from Mr. Yates Thompson has been addressed to Mr. Shaw-Lefevre:—

26A Bryanston Square, W. : March 6.

My dear Lefevre,—I have noticed in the Press that exception has been taken in some quarters to the last two of the five conditions which I attached to my recent offer with respect to a monumental chapel in connection with the abbey of Westminster—the one relating to the class of monuments to which the new chapel should be open, the other personal to the donor. It is obvious that these last two conditions are of much less

importance than the first three, by which it is proposed, in effect, that the new chapel form part of the abbey; that provision be made for its maintenance without the imposition of heavy fees on the erection of monuments as at present; and that it shall not be allowed to become a lumber-room for existing monuments, which it may be thought well to remove from the abbey itself. To these three conditions I feel that I must adhere. The last two rest on quite a different footing, and should, in fact, not have been stated by me as conditions at all, but rather as suggestions.

As, however, they have evidently given rise to some misapprehension, and as their importance has been much exaggerated, I think it best simply to ask you to allow me unreservedly to withdraw them, with the observation that I had no intention or idea of presuming to exclude the monuments of naval or military men—any more than of other classes which I did not mention—but attempted merely a general definition of the character of the memorials which in the practice of the present generation have been erected in the abbey.

I may add that I fully appreciate the desirability of removing the houses in Old Palace Yard and Poet's Corner before arriving at any final decision as to whether such an addition as Mr. Pearson proposes should be made to the abbey, and I willingly prolong the term mentioned in my letter to any reasonable extent, so as to enable the purchase and removal of the houses to be effected.

Thanking you for your great courtesy in the matter, I am, yours sincerely,

H. YATES THOMPSON.

The Right Hon. G. Shaw-Lefevre, M.P., Office of Works.

GENERAL.

The Duke of Norfolk has contributed 3,000*l.* towards the cost of a new Roman Catholic church at Dorking, in place of the present structure, which was built in 1871 through the generosity of the late Dowager Duchess of Norfolk.

Messrs. Mosley & Anderson, of Northampton, have succeeded in the competition for the new Congregational church and schools, Kingsthorpe Road. The school block will probably be proceeded with forthwith.

Mr. S. Roberts, jun., has gained the prize of 20*l.* in the open competition advertised by the Devonport Town Council for the design of an ornamental lodge and park-keeper's residence. There were twenty competitors.

The Trustees of the National Gallery have acquired a diptych by Fra Angelico, representing *The Annunciation*. It was painted for the church of San Francesco, near San Miniato, Florence.

The Design by Messrs. A. Billing, Son & Rowley has been adopted for the branch library in Wandsworth Bridge Road, which is to cost 2,600*l.*

The Death is announced of Mr. J. B. Mitchell-Withers, architect, suddenly, at his residence, Eccleshall, Sheffield, on Friday night, aged fifty-seven. He had devoted many years to the study of church architecture, on which he was regarded as an authority.

The Painting Class of the Royal Hibernian Academy opens for the session on Monday next, when female students will be admitted for the first time in the history of the Academy to the advantages of study in the schools.

The Coventry Town Council on Tuesday, after an angry discussion, agreed that in order to provide the best arrangements for the police buildings without interfering with possible municipal extension in the future, premiums be offered of 150*l.* and 100*l.* for the two best sets of plans, which are to become the property of the Corporation, without binding them to employ the designer or to carry out any part of the work.

M. Adrien Rey, a pupil of M. Laloux, has been awarded the Prix Achille Leclaire by the Académie des Beaux-Arts, for his design for a sacristy.

Mr. Herkomer, R.A., has been re-elected president of the Royal Birmingham Society of Artists; Mr. Creswick, modelling master at the School of Art, was elected professor of sculpture, and the other professors and officers were re-elected. Mr. Herkomer has promised to deliver his presidential address in the gallery on the 29th inst. The installation of electric light throughout the Society's rooms is now completed.

The Whitechapel Picture Show will be opened on Tuesday, the 20th inst.

The London School Board, in order to secure a *locus standi*, intend to present a petition in opposition to the Bill of the London County Council consolidating and amending the Metropolitan Building Acts.

The Dean of Ripon has issued an appeal for subscriptions towards the proposed reredos for the cathedral, which Mr. J. O. Scott has designed, and which will cost between 3,000*l.* and 4,000*l.*

Mr. Aldam Beaton will read a paper on "Decoration" at the meeting of the Liverpool Architectural Society on Monday, the 19th inst.

The Architect.

THE WEEK.

ONE of the most interesting and attractive features in the Building Exhibition is a collection which represents the Royal School of Art Needlework, and was contributed with the approval of H.R.H. Princess CHRISTIAN. By means of the loan the council-room has been transformed. The embroideries were prepared for a small sitting-room, the entire construction and decoration of which were in the Elizabethan style. The *portière* curtains are of golden-brown plush with a design in the same style, introducing the national emblems and royal coat-of-arms, as was usual at that period—of course, the emblems in this case relate to the Victorian era. The window curtains of gold brocade with borders of plush and the frieze of grey silk were designed to correspond with the other decorations. The suite is evidence of the elegance which pervades the School, and has gained so much success for its productions.

WE suppose it may be taken for granted that the Government will take steps to acquire the land which will shortly be obtainable in order to enlarge the British Museum when necessary, and to diminish the risks from fire. There is no group of buildings in Europe which contains so varied a collection as the Museum, and it would, therefore, be difficult to say what class of inquirers would suffer most if a fire broke out in Great Russell Street. On each side there ought to be an adequate open space between the Museum and the surrounding dwelling-houses. As some of the leases of the neighbouring tenancies are about to expire, there can be no question about the duty of the Treasury. At the present time the Trustees of the British Museum possess about nine acres, and an additional area of five and a half acres can be obtained by degrees as leases drop in for 200,000 $\frac{1}{2}$. That area would provide for the requirements of many years. There may still be advocates for a division of the collections, but the advantages gained by the costly experiment of removing the Natural History Department to South Kensington are too insignificant to warrant the transportation of any of the remaining collections. At one time the House of Commons might object to the purchase of property, for some of the departments were managed on the system of the ordinary Government office, and the officials were ingenious in devising obstructions to keep the public aloof, but nowadays the facilities for admission to all parts are almost too liberal, for genuine students are hampered by them.

WHEN the ten tenders for the erection of the new General Hospital, Birmingham, were opened, it was found that the highest was 154,585 $\frac{1}{2}$ and the lowest 138,000 $\frac{1}{2}$. They were all much higher than the building committee had expected. It was considered that the committee would not be justified in recommending any of them for acceptance. They accordingly requested Mr. W. HENMAN, the architect, to prepare amended plans and specifications, and to make such modifications as were reasonably possible, with the view of reducing the cost. When this was done the amended plans were submitted to Mr. WATERHOUSE, R.A., the consulting architect, who reported that they related to alterations at the rear and sides of the building, including the omission of a laundry. They did not in any way affect the design of the front elevation, nor detract from the building in any way, and Mr. WATERHOUSE complimented the architect for the manner in which he had dealt with the difficulty. The committee further reported that Mr. HENMAN had undertaken not to make any additional charge for the amendments and alterations of the plans. Amended quantities were then prepared, and fresh tenders were invited from eleven builders. All had availed themselves of the opportunity except Mr. JAMES MOFFATT and Messrs. MOWLEM & BURT. A meeting of the committee and supporters of the hospital was held on Tuesday, when the tender of Messrs. BARNSELY & SONS was accepted. The foundation-stones will be laid by the Duke and Duchess of YORK in August or September next.

THE announcement of the death of Mr. HORACE FRANCIS, architect, at the age of seventy-three, will be received with regret. For many years his firm were associated with buildings in the Metropolis. Among their works may be mentioned Crosby Hall, Bishopsgate Street (reconstructed); the National Discount Company's premises in Cornhill; the buildings belonging to the City Offices Company, which cost 300,000 $\frac{1}{2}$, and eight of the branches of the London and County Bank. They were also engaged in the erection of the Grand Hotel, Hôtel Métropole at Charing Cross, and the First Avenue Hotel in Holborn. Messrs. FRANCIS were architects for several churches, including the parish churches of Ringwood and Warrington; three churches in Paddington, one being Christ Church, Lancaster Gate; and four churches in Hampstead. Among their mansions is Cooper's Hill, now used as the Indian College, which may be referred to as a remarkable specimen of Domestic Gothic with Italian details. The late Mr. FRANCIS was an enthusiastic entomologist, and had presented many specimens to the British Museum. As a lover of pictures, he was a familiar figure in the metropolitan galleries.

THE office of engineer to the City Commission of Sewers has been so well filled for nearly half a century by Colonel W. HAYWOOD, we can understand how the Commission must feel his withdrawal from some of his onerous duties. The Corporation have had no officer who was more faithful or competent. Unhappily Colonel HAYWOOD has had recently to suffer from illness, and a man in his position could not be absent for a week without causing much inconvenience. It has been therefore decided that Colonel HAYWOOD should be retained as consulting engineer and relieved from continued attendance at the Guildhall or the meetings of courts and committees; but in consideration of his services being at all times available when required his present salary of 2,500 $\frac{1}{2}$ a year is to be continued. The alteration will cause further changes, and an inquiry is to be made concerning the staff in the engineer's office and how the department will be affected by the proposed retention of Colonel HAYWOOD as consulting engineer.

At the meeting of the Church Extension Society on the 15th inst. a conference was held on the position and space required for organs in churches. The following gentlemen from the Society's committee of honorary consulting architects were present:—Messrs. W. BASSETT-SMITH, JAMES BROOKS, EWAN CHRISTIAN, T. GARNER, B. INGELOW, J. T. MICKLETHWAITE, J. P. SEDDON, R. NORMAN SHAW and ASTON WEBB, together with the following musicians:—Sir JOHN STAINER, M.A., Mus. Doc.; Professor J. F. BRIDGE, Mus. Doc.; Mr. E. H. TURPIN, Mus. Doc., and Mr. T. C. LEWIS. The question was referred to a sub-committee to draft suitable recommendations.

THE recent destruction by the London School Board of the old Palace of Bromley-by-Bow—one of the few remaining Elizabethan houses in London—and the rapid disappearance of the ancient buildings of greater London, has suggested to Mr. C. R. ASHBEE, M.A., the formation of a watch committee, acting in conjunction with the Society for the Protection of Ancient Buildings, and the compilation of a register in which all work of an artistic and historic interest shall be catalogued, and, in some cases, marked with a red star for possible preservation by local authorities. It is proposed—(1) To undertake the work experimentally for one year; to systematically visit the old buildings of greater London; to catalogue them in the register and on the map; to find out, if possible, who are their ground landlords and their leaseholders, and ascertain the length of the leases; and to discover whether the local public bodies in whose province they lie could be brought to preserve or utilise them for municipal purposes. (2) To confine the sphere of influence of the watch to a radius of twenty miles. (3) To form, if possible, during the preliminary year, a watch committee, preferably of residents in the area suggested. (4) To place the results of the year's work at the disposal of the S.P.A.B. The committee of the latter Society have expressed satisfaction with the scheme.

JOSIAH WEDGWOOD.*

THE position which WEDGWOOD occupies among English producers is remarkable, for it is unique. The pottery which bears his name, or at least the variety of which he was most proud, was not only originated but perfected by him, so that no improvement in it can be credited to any of the men who came after him. Rival potters have not attempted to surpass it. On his monument in Stoke Church it is recorded that he "converted a rude and considerable Manufactory into an elegant Art and an important part of National Commerce." The statement is not free from some of the customary exaggerations of the epitaph-maker, but in one sense they are suggestive, for WEDGWOOD helped to make English pottery so beautiful that it was sought after by foreigners as a treasure rather than for common use. A man like WEDGWOOD is therefore not unfitted to be the subject of one of the "Portfolio Monographs in Artistic Subjects."

It is not easy to explain his idiosyncrasy in a few words. Dr. WENDELL HOLMES appeals for sympathy with the mute MILTONS, for "those that never sing, but die with all their music in them." There are also men who have all the qualities of artists with the exception of the most essential—creative power. WEDGWOOD seems to have been one of them. We doubt if he could explain to a designer what he required by the aid of pen or pencil. But he was able to take bits out of different figures, and combine them in a way that surprised connoisseurs. Such compound figures, it should be remembered, were not bizarre things, but were classic in spirit. There was no man in the eighteenth century who possessed a more keen appreciation of the work of the Greek potters than WEDGWOOD; he had always a sort of ideal in his mind which was to him a standard, although he was incompetent to express its characteristics by lines or in clay. It enabled him, however, to be a severe judge of everything which came before him.

If he had been born in a higher class of society, WEDGWOOD was likely to have ruled among amateurs by his refined judgment, and he would have directed the Dilettante Society with success. Belonging to a family that had produced pottery alone and prospered in doing so, it was natural for him to remember that, from a manufacturer's point of view, pottery was a means of making money. Occasionally WEDGWOOD would gratify himself with the creation of such objects as the Barberini or Portland vase, which were profitable only in an indirect way; but in general he controlled all enthusiasm, and his manner of getting out heroic and mythological subjects was sometimes sordid rather than economical. He once, for example, gave an order to FLAXMAN to model three of the muses at half a guinea apiece. When he was satisfied that he had received full value for his money, WEDGWOOD gave a commission for the remaining six. From the three he divined FLAXMAN's intentions, and immediately he tried his hand at making up patchwork figures that would correspond with them. He calculated that by that process a muse would cost no more than five shillings. WEDGWOOD thereupon wrote in as much haste to FLAXMAN to countermand the order as if the sum involved meant thousands of pounds instead of thirty shillings. A good deal of the elegance which is the characteristic of WEDGWOOD's pieces was, strange to say, due to the parsimony exercised in his dealings with designers. His treasury of patterns consisted of engravings from Greek vases. As long as a bit of detail could be copied from one of those examples WEDGWOOD would not invest in original designs. He preferred, because it was cheaper, to imitate what was old rather than to utilise the imagination of the time. When it was necessary to have something original he took care that it was to be accompanied by bits of ancient ornament. In that way there was a limitation which made extravagance almost impossible. The artists had to keep within bounds, and as they had to work up to prescribed patterns, there was no chance of indulging in conceit. WEDGWOOD was, of course, a moral man, and, after being trained under him, it is no wonder that FLAXMAN used to deliver homilies about the advantages of humility and other virtues to young artists who called upon him.

One of the defects of the artist's nature in the eyes of professors of ethics is that they wish to have their names associated with their works. In WEDGWOOD's factory that sort of weakness was out of place. In order that there might be no temptation to the designers, he was good enough—for he knew his moral strength—to take all the admiration himself. A designer thus became as impersonal as one of the potter's wheels. They were both only instruments to carry out the projects of a superior mind, who would have preferred to dispense with both aids if any others that were cheaper could be discovered. Professor CHURCH, who is an official of the Royal Academy, in his monograph imitates his predecessors in putting forth a long "list of the chief modern artists whose designs or models were used by WEDGWOOD." It is an excellent device for blindfolding the public in order that they may imagine that WEDGWOOD was a munificent patron of artists. In the list we have the names of Sir JOSHUA REYNOLDS, CHARLES LE BRUN and a crowd of Italians. Why does not the Professor tell us what sums those artists were paid and identify the works which they designed? He says, indeed, that "in a considerable number of cases extant productions of WEDGWOOD's factory can be definitely assigned to many of the artists whose names are here recorded"; but Professor CHURCH must know that probably not one per cent. of the productions is in that category, since care was taken to conceal the extent of the assistance given by artists. According to him, WEDGWOOD "was not a mere employer of artists, not a mere translator into clay of designs made by other hands in other materials. Nor was he a mere copier of the antique. He possessed a marvellous power of co-ordination and adaptation, and appreciated the grace of congruity, although he occasionally allowed the association of incompatible decorative elements. He was endowed with an inventive faculty which revealed itself not only in new materials and methods, but in the origination of new forms." If put to the test of a comparison of WEDGWOOD's products, these words will be found to express the simple fact that the potter was possessed of a remarkable power of combining odds and ends of designs, and that in the nineteenth century, as in the eighteenth, his medley is assumed to be an origination of new forms. As regards WEDGWOOD there is little use in descanting on the defects of his system, and subsequent producers of the ware are not likely to depart from his precedents. But it is well for other manufacturers to remember that WEDGWOOD's example is dangerous, for they are never likely to repeat his success by combining scraps. He had the shrewdness to keep to a mock Classic style in his best work, for he knew that all modern attempts at classicism are most appreciated when originality is only to be discerned with difficulty. But that style is not for the multitude, and industrial art is always likely to be most profitable when it shows correspondence with the intentions as well as the demands of that time in which it was produced.

If considered as an organiser, a captain of industry, WEDGWOOD might be taken as an example which in these days, when so much is said about technical education, deserves attention. Born in Burslem in 1730, JOSIAH WEDGWOOD grew up among potteries. In his ninth year he was employed by his eldest brother, and became dexterous in "throwing." Five years afterwards he was apprenticed. As he was delicate he could not long work at the bench, and he was obliged to make himself useful in other ways. When his apprenticeship was ended he entered into partnership with two potters. As he was not satisfied he left the firm and spent a few years as a partner elsewhere. About 1758 WEDGWOOD set up his own works, paying a rent of £10 a year. He was a true work-master, one that laboureth night and day, and who was acquainted with all the details of the craft, from the selection of clays to the packing and forwarding of goods. But he perceived it was not advantageous commercially for his workmen to be as knowing as himself. As soon as possible he introduced the system of division of labour by which they became "hands." Professor CHURCH has to admit that, when looked at from the collector's standpoint, the change was not a benefit. He says:—"It is not to be denied that the methodic revolution which he effected in the technique of his pottery resulted in the loss of certain elements of value. The quaintness, the naïveté, the picturesqueness of the rough processes and

* *Portfolio Monographs: Josiah Wedgwood, Master Potter.* By A. H. Church, F.R.S. (Seeley & Co., Limited.)

products of the older days disappeared. Individuality was lost. The workmen became parts of a well-ordered and accurately-adjusted machine. The marks of human handiwork became unrecognisable. A tendency to aim at mechanical perfection and mere finish was developed at the expense of higher qualities."

One of WEDGWOOD's first improvements was a material for cream-coloured earthenware. If he possessed the chemical knowledge which is now easily obtainable, his labours in search of it might have been lightened; but he obtained a result that was at once appreciated. The interest of the ware was increased by calling it Queen's Ware. From cream-coloured ware he turned his attention to the "Egyptian black" ware, and his black basalt was well adapted for ornamental work.

At this time he had to encounter another difficulty. The design that was common at the time was not worthy of a fine material. Professor CHURCH says that "WEDGWOOD's encaustic paintings on vases and plaques have generally a depressing effect, and the ornament of his early work is not more exhilarating." WEDGWOOD had to train his designers, and the improvement in quality of their work was not less remarkable than in the preparation of clays. In treating of the latter Professor CHURCH has the advantage of being a chemist as well as a collector, and his chapters on the variety of WEDGWOOD's work have more technical precision than is to be found in costlier books.

WEDGWOOD realised that he was more likely to succeed with pottery of a sculptural than of a painted class. What was the use of toiling after material if it had to be concealed with colours? For reliefs as well as grounds the material could not be too well prepared, and it was always to be seen. The decoration might be ancient or modern, but every vase, plaque, cameo, bowl or pedestal was a testimony to the skill of WEDGWOOD in making mixtures of clays and other substances. We need not wonder that he carried on his experiments in the cellars of his house as if he were an alchemist or a preparer of one of the modern "resources of civilisation" for the destruction of society. Professor CHURCH cannot, of course, treat WEDGWOOD as a great chemist; and the science at that time could not have rendered him much aid in his inquiries, but "it may be freely conceded that in his knowledge of chemistry and of physics WEDGWOOD stood alone among the potters of his day." He was not disposed to sympathise with other labourers in the same direction. WEDGWOOD rejoiced when he found that RICHARD CHAMPION, of Bristol, had failed to manufacture true porcelain, although there was no direct competition between the two men.

The ill-health to which WEDGWOOD was subject may have increased his selfishness. Although with the help of his partner BENTLEY his cares in business were lessened, and he was able to retire in 1790, he did not reach his sixty-fifth year. His success should be an encouragement to many generations of manufacturers, for pottery is not the only class of work which can be extended and improved by steady and continuous application.

THE LONDON GUILDHALL.*

THE Guildhall Art Gallery, in which we are now assembled, was opened by Lord Mayor Staples in 1886. The average attendance of visitors is 56,000 annually. It has been enriched by many presentations, among the donors being several of the City Companies and members of the Corporation. Among the latter I am pleased to note two from members of my own Ward of Farringdon Within, one of which represents King Jeroboam's wife at the house of the blind Prophet at Shiloh, who tells her from Jehovah that her son, who is sick, will not recover (see 1 Kings xiv.). Recently it has received a munificent gift from Sir John Gilbert, R.A., consisting of sixteen important pictures, five being in oil and eleven in water-colours, the value of which is stated by competent judges to be 12,000*l.* Beyond the mere monetary value, however, is the consideration that in all probability this noble example will be followed by others. Indeed, one has already done so, and we have reaped the first-fruits of Sir John's liberality in the fine picture entitled *Salome Dancing before King Herod*. On two occasions recently the Gallery was occupied by a loan collection of celebrated pictures, admis-

sion to which was free, the whole attendant expenses being borne by the Corporation. The venture was exceedingly popular, the attendance in 1890 numbering 109,000, while that of 1892 was 236,000. An opportunity has been thus afforded to the general public of viewing works of art from private collections, which otherwise they could never have seen. Arrangements for a third exhibition are in progress, and the loan of many valuable works has been promised.

The library was originally established in 1425, mainly through the generosity of Sir R. Whittington, who was thrice (some say four times) Lord Mayor of London. In this laudable enterprise he was well supported by William Parry and John Carpenter, the latter of whom founded the City of London School. So keenly alive were our leading citizens to the value of education 450 years before Board schools were heard of. The library was originally attached to the ancient College of Guildhall. It remained intact until the reign of Edward VI., when the books were sent for by the Duke of Somerset, Lord Protector, with a promise that he would shortly restore them. No less than three cartloads of books were forwarded to the Duke, but whether he discovered their rare value and retained them, or from some other reason, certain it is the books were never returned. This library had a flourishing existence for over 100 years, and of the priceless MSS. it once contained not one volume is now known to be in existence, while the building itself perished in the Great Fire of 1666. From various causes no serious step was taken by the Corporation to re-establish the library until the year 1824. In that year the City authorities generously advanced the necessary funds, and the present library was opened June 1829. From 1,700 at the commencement, the volumes had increased to 10,000 in 1840, and now number 68,369, in addition to 38,075 pamphlets. The library has been found exceedingly useful, especially in the direction of technical education, help from the various works being readily obtainable whether for trades or professions. The building itself is 100 feet long, 65 feet wide and 50 feet high. It is fitted with handsome oak bookcases, forming twelve bays, into which the furniture can be moved when the space is required for State or other receptions. The handsome oak roof is supported by the royal arms, as well as those of the twelve great City companies. The large north window claims special attention. It was the gift of inhabitants of the Ward of Aldersgate, and is very beautiful. In the three upper centre lights we see Caxton and his printing press at Westminster, the central figure representing the great printer showing his work to Edward IV. In the three lower centre lights is seen Richard de Bury, Bishop of Durham, purchasing the library of the abbot of St. Albans for fifty pounds' weight of silver. There are also figures of Whittington, Gresham, Stow and Milton. Below is a representation of old Aldersgate. Appended is a list of rare books, &c., on view in the reading-room:—"French Chronicles," vellum, 1399; Dutch Bible, vellum, 1360; Koran; "Liber Fleetwood," 1576; Autographs, &c., of Lord Mayors of London from 1659 to present time; "Biblia Sacra Latina," vellum, fourteenth century; "Aldersgate Service Book," vellum, fourteenth century; Dutch Bible, 1477; "Biblia Sacra Latina," 1483; "Livy," 1485; "Nuremberg Chronicle," 1493; "Froissart's Chronicles," 1495; Higdon's "Polycronicon," 1527; Arnold's "Chronicle," 1502; Stow's "Survey of London," 1598; "Recreations of Master Zigzag the Elder;" Lyson's "History of London;" Thomson's "Chronicles of London Bridge;" Clarke and McArthur's "Life of Nelson;" "Coronation of George IV.," Hogarth; Roberts's "Holy Land;" Alphand's "Les Promenades de Paris;" "Fans and Fan Leaves," by Lady Schreiber; "Old Inns," by Edwards; "Streets and Canals of Venice." From the Museum:—A collection of City charters; Shakespeare's autograph; the sword surrendered to Nelson at the battle of the Nile, and presented by him to the Corporation with accompanying letter; the wooden tallies given by the City as security for moneys advanced for building London Bridge, 1825 to 1831; also a fine loan collection of watches belonging to the Watchmakers' Company, and a large assortment of coins, medals and jewels.

The crypt is 76 feet long, 45 feet wide and 13 feet high. It is remarkable for the perfect condition of all its members, arches and groins. For excellence of design, extent and soundness of construction it may be considered an unrivalled, and indeed unique, example of its kind. It was restored in the year 1851. On July 9 of that year the Corporation gave a grand and most successful entertainment to Her Majesty the Queen, the late Prince Consort and all those who took a foremost part in the first great exhibition in Hyde Park. The crypt was specially set apart to the service of Her Majesty as a supper-room. Upon oaken sideboards was displayed the valuable plate of the several City companies. Around the columns policemen were stationed, clad in armour obtained from the Tower, each holding in his hand a torch by which the crypt was lighted. The western portion was filled with trees, vines and flowers, among which hundreds of singing birds were let loose, thus giving the appearance of a forest glade in summer time. The whole structure forms part of the ancient

* A paper read by Mr. C. J. Cuthbertson at a visit of the United Wards Club to the Guildhall.

Hall, erected in 1411, and fortunately escaped the Great Fire. Any paper upon a building so ancient as the Guildhall, and withal so rich in civic and historical interest, must necessarily be imperfect. Of its earliest history few authentic particulars can be obtained. According to the most reliable accounts the original Guildhall dates back to the year 1189 or thereabouts. The present hall was commenced in 1411, in the twelfth year of Henry IV. Between these dates few particulars can be ascertained. We are indeed told that it was enlarged in 1326, in the reign of Edward II., and that one Thomas de Mayrns, chamberlain, "was rewarded for his pains and diligence about the repair of the Guildhall in the years 1341 to 1343." The present fabric was raised largely by the liberality of the Mayor (Sir Thomas Knowles), the aldermen, and the several City companies. When their resources failed, fines in aid were levied upon the citizens for ten years, while moneys received for the pardon of offences went to swell the building fund. Much public interest was felt in the enterprise, and King Henry V. granted the City "free passage by land and water" for the necessary building materials. The windows were glazed by the aldermen, each placing his coat-of-arms in coloured glass in his own work. The executors of Sir Richard Whittington paid a handsome sum toward paving the hall with hard Purbeck stone. Various additions and alterations to the structure were made from time to time, but, with the exception of the crypt and a portion of the walls, the whole was destroyed in the Great Fire.

The appearance of the hall during the conflagration is thus described by an eye-witness:—"That night (September 4, 1666) Guildhall was a fearful spectacle, which stood, the whole body of it together, in view for several hours after the fire had taken it, without flames (I suppose because the timber was of such solid oak), in a bright shining coal, as if it had been a palace of gold or a great building of burnished brass." We need not follow the history of the time-honoured building during the next two centuries, except to remark that, according to some authorities, the renowned Sir Christopher Wren had some share in its subsequent reconstruction. Under the direction of the then City architect, Guildhall was brought to its present condition in 1864, and in the following year the beautiful open-timbered roof, which forms so attractive a part of the building, was completed. This roof is as nearly as possible framed to resemble that destroyed in 1666. The hall itself is 152 feet long, 49½ feet wide and 89 feet high. Of the stained-glass windows the following deserve notice:—1. That in the east end was presented by the operatives of the cotton districts in acknowledgment of timely assistance rendered to them by the City in the hour of need. The Relief Fund raised at the Mansion House during the crisis caused by the American Civil War reached over 500,000*l.* 2. That in the north-west corner represents the following:—William the Conqueror holding in his hand the first charter granted to the City of London; Henry I. presenting a charter to the City; Richard I. granting a similar charter; Edward VI. presenting charter of four royal hospitals. 3. Another commemorates the freeing of 5,500 acres of Epping Forest by the Corporation for the free use of the public for ever. We must not omit a passing reference to the familiar figures of Gog and Magog, which were made and put up by a City carver in 1708. They measure 14½ feet in height, and took the place of two old wickerwork giants, which were formerly carried in Lord Mayor's processions. Amongst the monuments may be mentioned that of (1) the Duke of Wellington, costing 4,966*l.*; (2) that of Lord Nelson (inscription by Sheridan), costing 4,442*l.*; (3) the Earl of Chatham (inscription by Edmund Burke), costing 3,421*l.*; (4) William Pitt (inscription by Canning), costing 4,078*l.*; and (5) Lord Mayor Beckford. Standing in the Guildhall, the mind is easily carried back to the many and important events that have occurred here from the days of the Edwards to those of Victoria. A long series of sumptuous entertainments to royal and distinguished persons have been given within its walls. From these we make a selection. Edward II. here partook of the City's hospitality to commemorate the birth of a prince. The proceedings are thus described in a record of the time:—"The Mayor and the aldermen assembled at the Guildhall, together with the good folks of the Commonalty, and from thence they went to St. Paul's. After service carols were sung in the church to the sound of trumpets, and then each returned to his home." The day was proclaimed a general holiday. In May 1357, a banquet was given in honour of John King of France and Edward the Black Prince. Early in the fifteenth century Henry V. was entertained to commemorate his victories in France. Being short of cash, this monarch pledged a portion of his jewellery to the Corporation for a sum equal in our day to 10,000*l.* Amongst His Majesty's creditors was that worthy citizen Richard Whittington, whose generosity to his sovereign is thus described:—"In his last Mayoralty, King Henry V. and Queen Catherine dined with him in the City, when Whittington caused a fire to be lighted of precious woods, mixed with cinnamon and other spices, and then taking all the bonds given him by the king for money lent, amounting to no less than 60,000*l.*, he threw them into the fire and burnt them,

thereby freeing his sovereign from debt. The king, astonished at such a proceeding, exclaimed, 'Surely never had king such a subject,' to which Whittington replied, 'Surely, sire, never had subject such a king.' In 1641 Charles I. was entertained by Lord Mayor Gurney, and in 1653 Cromwell dined at the Guildhall and knighted the Mayor. Charles II. frequently dined here, and on one occasion we are informed that Lord Mayor Viner and the company generally passed the bounds of decorum, a charge which it would be difficult to prefer in the present day. So attractive to the "Merry Monarch" was a Guildhall banquet that he dined here nine times altogether. In 1689 William and Mary came to see the Lord Mayor's Show, and, together with "both Houses of Parliament, the Privy Councillors, Judges, Ladies of the Bedchamber, and other ladies of the chief quality," dined at Guildhall in the evening. His Majesty, with his Queen, repeated the visit in 1692. In 1702 Queen Anne was entertained by Lord Mayor Vintner. In 1727 George II. and his Ministers dined with Lord Mayor Becher, and remained to the subsequent ball. In 1761 George III., with Queen Charlotte and the royal family, came to view the show, and afterwards to dine with Lord Mayor Fludyer. William Pitt was also present. The Lord Mayor and aldermen waited upon the royal guests, who showed their appreciation by remaining until the small hours of the morning. His Majesty was known to remark, "To be elegantly entertained we must come to the City." In 1806 seven of His Majesty's sons were entertained by Lord Mayor Shaw, while in 1814 Lord Mayor Sir William Domville gave a banquet to the Prince Regent and the Allied Sovereigns before the Battle of Waterloo. The sumptuous feast was served on plate valued at 200,000*l.*, the banquet itself costing nearly 25,000*l.* On Lord Mayor's Day, 1837, Her Majesty was entertained by Alderman Gowan, and as before hinted, in 1851 a splendid entertainment was given to the Queen, the late Prince Consort, and a distinguished company. The Jubilee of Her Majesty's reign is still fresh in the public memory. A reception was then given in the Guildhall to the whole of the royal family and Her Majesty's royal guests, who were welcomed to the City by the Prince and Princess of Wales. A very hearty welcome was also given in 1891 to the Emperor and Empress of Germany, and in 1893 to the King and Queen of Denmark. On the former occasion Her Majesty rightly interpreted these hospitalities by remarking, "I consider this not a City reception, but a national reception." Every citizen will echo this sentiment, believing that in these functions the Corporation in some measure acts the part of the national host. In closing this hurried review of the festivities here offered by the Corporation to Royalty and others we are aware that some regard such entertainments simply as a means of personal gratification only, and even accuse the City of wasteful extravagance in these matters. We, on the other hand, venture to think that by inducing our reigning sovereigns, our statesmen, judges, naval and military heroes, and other distinguished sons and daughters of Britain to accept her hospitality, the City has received and conferred a distinct benefit, for the oftener the rulers and the ruled can meet together under healthy social conditions, the more sturdy will be the people's loyalty and the more stable the sovereign's throne. We pass on to remark that in the Guildhall are presented the freedoms and thanks of the City to those whom the citizens deem worthy of honour. Among such presentations during Her Majesty's reign may be noted that to the Prince of Wales in 1863, that to the Duke of Edinburgh in 1866, that to the Duke of Connaught in 1870, that to the late Prince Leopold in 1875, that to General Grant in 1878, that to the late Prince Albert Victor of Wales in 1885, and quite recently to the Right Hon. W. Lidderdale, late Governor of the Bank of England, in recognition of splendid service rendered by him and others in preventing what otherwise must have been a widespread financial calamity. Having looked at the brighter, we must not omit a brief reference to the darker associations of the Hall. For upholding purity of election at the Guildhall Chaucer was deprived of office and sent to the Tower. Here, too, the Duke of Buckingham, after the death of Edward IV., endeavoured to win over the citizens to obtain the throne for Richard. Here, in the reign of Henry VIII., noble Anne Askew was tried, and after being racked, and refusing to recant, was burnt at Smithfield. Here, too, in 1546, the Earl of Surrey was tried on a charge of high treason, condemned and beheaded on Tower Hill. Passing from Guildhall to the Council Chamber we note in the lobby the paintings symbolising the armorial bearings of the City and Livery Companies (the gift of Sir Stuart Knill, Baronet). The new chamber was begun in 1883, and the first meeting was held in it October 1884. It was built from designs by the City architect. There is sitting accommodation for the Lord Mayor, twenty-five aldermen, the high officers and 206 common councillors. Galleries are provided for the public and the press. We next visit the alderman's room, the richest apartment connected with Guildhall. The ceiling is noticeable for a painting by Sir James Thornhill. This apartment is used for the sittings of

the Court of Aldermen, who form the bench of magistrates for the City. Each alderman's chair bears his name and coat-of-arms.

In conclusion, we may perhaps be pardoned in claiming that by helping forward the younger generation of our citizens, and fitting them to occupy worthy positions in life, our library has done a useful and even noble work. As for our venerable Guildhall, now more than 500 years old, we think of its past with pleasure, not only because during all these centuries it has been the happy and fruitful meeting-place of sovereigns with the people, but also because it has been the field upon which the battle of right against might has been successfully waged by our citizens. May the Corporation of London, whose cherished home is their Guildhall, long continue. For many centuries—as its records prove—it has laboured for the public good, and, all assaults notwithstanding, we trust that, with powers unimpaired, those labours may long be directed to the increased advantage of the City and the good of our common country.

THE ACOUSTICS OF BUILDINGS.

A LITTLE note which was published lately in this journal about the acoustics of buildings, having been reprinted in the *American Architect*, has drawn the following remarks from Mr. John Lyman Faxon, architect, of Boston:—

I noted in your issue of November 11 last, page 80, a clipping from the *Architect and Contract Reporter* giving the rule for a cross-section of an auditorium—as a principle of good acoustics. The said citation assumes (its general intent, as I take it) that the said rule is of universal nature, applicable in all cases. It is not so, and it suggested to me that a few words upon the subject might not be wholly uninteresting to your readers.

This is not intended by any means to be an essay on acoustics—both space and time forbid—but simply to state in as few words as possible why the rule or principle referred to is misleading, and will not answer in all problems, and to outline some of the primary laws and elements which enter into a problem of acoustics, such as I have considered and followed in my own practice, with gratifying results.

1. As to the rule above noticed: if the same is of general application, then auditoriums, churches, theatres, music-halls and the like would have to be of much less height than they now are, otherwise they would not be good acoustically (which some are), or the platform or stage would need to be much elevated above the average level, and the ceiling of the barrel-vault type. For, according to this rule, in an auditorium (theatre, for instance) 78 feet wide and 65 feet high—an average size—the speaker's mouth (the phonic centre) would need to be 26 feet above the floor. We know that such is not the need. On the other hand, assuming this rule to be in force, an auditorium 78 feet wide would call for a height of about 47 feet 8 inches.

The fact is that the rule referred to is one of minor importance—applicable, with good results, under certain conditions, but not at all necessary under other conditions; these other conditions affecting this special rule vastly more than it can possibly affect any given case. Acoustic results depend almost as much upon knowledge of the various materials entering into the construction and finishing of an auditorium, as upon a thorough knowledge of acoustic laws governing the propagation, reflection, or augmentation of sound.

I know of no science in connection with our art of architecture in which the truism of the old saying "A little knowledge is a dangerous thing" bears more directly than in this matter of acoustics, and the average practitioner will need to go but a short span over the road of research which I have travelled to convince him of this.

2. Assuming that the genesis of sound is of right quality, *i.e.* as to purity and normal intensity, whether of speaking or music, oral or instrumental, there are certain fixed laws which govern its transmission and diffusion, and certain elements which affect its purity, harmony and right hearing, and briefly they are stated as follows:—

- (a) Pure air and a normal temperature of 70 deg.
- (b) Uninterrupted transmission.
- (c) Sympathetic, *i.e.* harmonious, vibration.
- (d) Minimising of reflection.
- (e) Prevention of echo.
- (f) Diminution of sound when necessary, *i.e.* when the size of the auditorium is considerably within the limits of natural radiation.
- (g) Augmentation of sound when necessary, *i.e.* when the size of the auditorium is considerably in excess of the limits of natural radiation.

As to natural radiation of sound: the Greeks well understood its phenomena, and the plans of ancient theatres are laid down accordingly (as to which the reader is referred to Stuart & Revett's "Antiquities of Athens," Vignola, Sanders,

and an interesting work in Italian, "L'Acoustica," by Antonio Favaro-Torino), and may be briefly stated as follows:—Inscribe an area with a circle having a radius of 60 feet; then placing the phonic centre, *i.e.* the speaker, 30 feet from the periphery, the sound (*i.e.* of normal speaking pitch) will be heard 90 feet directly in front of the speaker, 30 feet back, and 52 feet 6 inches directly upon either hand; in other words, a row of hearers standing in line around the periphery will hear the speaker with equal distinctness in pure air at 70 deg.; as the hearer recedes from—gets outside of—the periphery, so will his sense of hearing decrease, or, in other words, the sound fail to reach him.

As to (a) transmitting medium: the velocity of sound is conditioned upon the elasticity or density (purity) of the medium, air—the greater the elasticity the greater the velocity; the greater the density (impurity), the less the velocity. Sound travels faster in warm air than in cold, and at a rate of 1,130 feet a second in pure air at 70 deg.

The clearness and purity of sound is conditioned upon the equality of its vibratory transmission, and this equality of vibration can only be maintained in air of equal elasticity and purity; so that uniform temperature and purity of air is one of the first essentials for the equal transmission of sound, not only in spots but throughout every portion of an auditorium.

This condition can only be obtained by a perfect system of heating and ventilation, and such a system should help, not retard, transmission. If the direction of the heating or ventilating currents is towards the stage, transmission and vibration will be retarded and *vice versa*; the direction of such currents should be along with the direction of the sound-waves.

As to (b) uninterrupted transmission: free space should be provided for the transmission between the genesis of sound and the auditors; solid features, like columns, partitions, balcony fronts, &c., should be rigidly avoided; balcony fronts should be of perforated iron or woodwork (wood is best), to prevent reflection and to admit of the sound-waves passing through and being absorbed by the clothing of the audience; and in the case of partitioned boxes, as in an opera-house, the partitions should be on radial lines from the phonic centre.

As to (c) sympathetic, *i.e.* harmonious, vibration: the propagation of sound is by multitudinous waves sent out in all directions from the genesis of sound (a simple illustration is afforded by dropping a pebble into water, though this is not an accurate illustration, inasmuch as the sound-waves do not expand in the form of rings, but rather in the form of millions of lines having wave-motion in transmission). These waves or lines have an undulatory or vibratory movement of periodic extent and amplitude, and this extent and amplitude of the wave is governed by the force, intensity, pitch or initial vibration of the particular note creating its corresponding wave in the air. Consequently, (1) the air must be in a condition to vibrate sympathetically with the initial vibration, and (2) as the waves are of periodic extent and amplitude, it is necessary that the dimensions or scale of the auditorium shall coincide in every direction, as far as possible, with the extent or scale of the vibratory motion or waves. For instance, the French standard pitch *C*, of 512 vibrations per second, propagates a wave whose extent is $2\frac{207}{1000}$ feet; therefore it follows, if this note *C* is taken as the "fundamental note" of the auditorium, the scale upon which such an auditorium must be designed must be of a unit of $2\frac{207}{1000}$ feet, and the shape of the auditorium should conform to the extent or end of the numerous radiating waves in musical progression, *i.e.* in a ratio of 5, 6, 7, 8, 9, &c.; and if this ratio of proportion is adhered to, the forces of impact of the waves upon the enclosing surface (or in other words, the force of reflection from such surface) will be equal in all parts and reflection may be prevented. Further, the form of the ceiling should not be flat, but curved, but the line of this curve cannot be any curve or series of curves which the architect may think "looks well," but is determined by the height of the centre of the ceiling above the floor and its distance from the phonic centre, and this initial curve will not coincide with the plane of transverse section of the house, but must coincide with the plane of a line or wave radiating from the phonic centre to the centre of the ceiling. The acoustic faults of the Trocadéro at Paris are almost wholly due to the faulty lines or shape of the ceiling and the stage opening—being of such contour as to aggravate reflection and to concentrate reflected waves at certain places in the house.

As to (d) minimising of reflection: this is an element which can hardly be set forth clearly in writing; (1) because even a slight variation of the lines of an auditorium will change the angles and force of reflected waves; (2) because reflection will largely depend upon the nature of the materials used in finishing and decorating the interior, a most important consideration, of which knowledge can only be gained by experience, observation and study; but the following general principles may be stated: (a) that hard or smooth surfaces reflect more and with greater force than rough or soft ones; (b) that the angle of reflection is the same as the angle of incidence; (c) that reflection will be more powerful within limits considerably less than

those stated in the seventh paragraph, and less powerful when the limits exceed those stated as aforesaid; (d) that much study needs to be given to the shaping of the plan and the elevation of walls and other parts, to prevent reflected waves coming in contact with direct waves; (e) that balconies, if properly designed, are a great help in preventing reflection, their lines depending on the distance from and height above the phonic centre, and their projection from the walls; and utmost care should be taken that the height of wall back of and above the upper balcony be so designed that waves may not be reflected from said wall to the ceiling, and as before stated, the balcony-fronts should be in all cases open-work, not solid.

Care should also be taken that the plan, section and opening of the stage (the focus of genesis) are of such contour that direct waves will not strike the ceiling forward of the centre, *i.e.* between the centre and the stage wall or proscenium.

As to (e) prevention of echo: what I have observed in the fore part of the preceding paragraph holds good as to echo; no fixed rules can be written as to its prevention. Echo is due to reflection and to the intensifying quality of resonant materials injudiciously placed. Possibility or probability of echo can only be determined graphically by laying out the direct waves, reflected waves and succeeding reflections.

As to (f) diminution of sound: it will be easily understood that there will be a preponderance of sound (of given intensity) in an auditorium, say, 60 feet in diameter over one of 120 feet diameter, and that the force of reflection will be much greater; it is therefore necessary to so construct and finish the auditorium that resonance will be reduced and reflection prevented.

As to (g) augmentation of sound: it will be easily understood that there will be a diminution of sound (of given intensity) in an auditorium, say, of 240 feet diameter inferior to that in one of 120 feet diameter, and that the force of reflection will be much less; it is therefore necessary to so construct and finish the auditorium that it will be of augmented resonant quality; sometimes powerful resonators are necessary, as, for instance, a sounding bell below the floor of the auditorium. The stage also must be planned and constructed in the form and nature of a great resonator, so as to augment the genesis, timbre or power of sound.

These elements of transmission, reflection, echo, diminution or augmentation of sound are of vital importance in any attempt to design an auditorium to be a success as regards acoustics, and demand of the architect not only something more than a superficial knowledge of acoustic laws but also a knowledge of the influence of the various materials which he may be led to employ in the construction and finishing of an auditorium, and the manner in which such materials may be used to the best advantage.

TESSERÆ.

Smoky Chimneys.

CHIMNEYS, especially kitchen chimneys, frequently smoke from their being too small; in the chimney-pot being too small to allow the free passage of the smoke from a kitchen or other large fireplace. Chimneys frequently smoke from their being too short, as in attics, for although the openings for the stoves in that part of the house are usually small, which is an advantage, the flues have not power to contend against the dense air at the top and the various currents and eddies occasioned by the wind. A large opening of fireplace, that is to say, an opening disproportionate to the size of the chimney is an evil. As water passes more slowly (which is perceptible) through the wide part of a river or stream than it does through the narrow, or under a bridge where the piers, &c., reduce the waterway, the same quantity of water having to pass, so kitchen chimneys with large openings at bottom are more disposed to smoke than those with narrow ones, as the air in entering them, being dispersed over so large a space, the current is not sufficient to carry up the sooty particles with it, and allows much to fall in the room. The air will, however, pass more freely under that part of the chimney-breast that is immediately beneath the upright shaft, and the range or grate should be so constructed for the fire part to be as nearly as possible at that point, *i.e.* towards the right or left of the fire-opening as the shaft may be. It is not said with reference to the front part of the grate being forwarder than the shaft. Chimneys frequently smoke from being in a cold situation, as in an external wall with only the thickness of half a brick between the flue of the cold or damp atmosphere, which is very usual in detached houses, also in low outbuildings where the chimney is carried up alone above the roof and all sides exposed to the cold, or against a wall with three sides exposed. In the case of a low chimney being near a high building, the air, passing over the high building, will drop like a waterfall upon the low chimney, or when blowing strong from the contrary point against the high building will rebound and form an eddy upon the top of the low chimney,

and thus impede the free ascent of the smoke from the same. Two or more fireplaces to one flue, which, unless very judiciously arranged, is nearly certain to cause smoke, and likewise the want of a proper supply of air. Large rooms having two fireplaces, or drawing-rooms communicating by doors—if one flue is in a warmer stack than the other, or has a stronger fire kept in the fireplace, that one will take away the necessary supply of air from the other or weaker one, and cause the smoke from it to descend into the room, and should there be no fire in the second grate it will even draw the smoke down that chimney from the surrounding chimney-tops to feed that one fire and flue. Many chimneys are called "dreadfully smoky" where the fires are seldom lighted, except in the evening, as is frequently the case in bed-chambers and dressing-rooms. Another annoyance from smoke is sometimes occasioned by the relative situations of the doors and windows in the room, by which the current of air from a door or window, having an outlet at another door or window, creates a sort of whirlwind and drives the smoke out of the fireplace into the room before it reaches the chimney-breast, as if bellows be used to a fire obliquely the smoke and flame will be driven to the contrary side of the grate, the flue having no control over the smoke, which is driven away by a strong current before it reaches the chimney, as the air to supply the flue will pass immediately under the chimney-breast, while the smoke is carried away by an under-current into the room. Another and a very prevailing annoyance is the smoke from an adjoining chimney, or from one in an adjoining stack passing down the flues that are entirely out of use, or at the time that there is not any fire in them. It is not uncommon for chimneys to smoke at the sudden shutting of a door, especially in well-fitted rooms where there is an inadequate supply of air. When a door is opened inwards it presses the air towards the chimney, and when suddenly shut the air is drawn back from the chimney into the room, and this will generally produce a puff of smoke. Many chimneys smoke from not having been properly cored at the time of the building of the house.

Versailles under Louis XIV.

The palace of Versailles was only an enlargement of a hunting-box that Louis XIII. built on a slope, where a windmill had once stood. An army of 36,000 men cleansed marshes and cut down wood to make room for Mansard's miles of magnificence. Le Brun had decorated this work of gorgeous prodigality with frescoed ceilings, where nymphs soared and floated, and where demi-gods struggled and struck attitudes. Le Notre had filled the gardens with all the wonders of French and Dutch horticulture. The marble limbs of writhing deities shone, like golden images in the sun, through veils of silver water, thin and transparent. Through the avenues of the orangery, where the gold fruit of the Hesperides glowed among the green, glossy leaves of Spanish orchards, the chiming cadence of a thousand fountains was heard. Here Bacchus rode exultingly, attended by a train of laughing satyrs. And here Flora tossed in the air handfuls of exulting flowers. Here a pyramid of molten silver revived the recollection of the alchemist's wonders. There stood Ceres holding her wheat-sheaf, while Cupids hand-in-hand circled her round with mocking eyes, as if exulting in the loss of Proserpine. Here the Siren sat on the rock, harping to the too guileless mariner, while all round sea-monsters belched arches of water from their throats that fell with uninterrupted harmony back into the marble basin, where the coloured bubbles chased and ran round and round, and where, through the water, could be seen the gold-fish of China, like enchanted things, crowding in jostling shoals, as the ladies threw them food or frightened them, in order to see their golden flash and scud as they flew off down to a safer depth. The fountains of Bacchus, Apollo, Flora, Ceres, the Dragons and the Sirens were well-known points of interest in the gardens, of which the most beautiful spots were the Allée d'Eau, where courtiers walked for a long way down a broad gravel avenue between rows of fountains, the orangery, the balustraded terrace leading by broad flights of steps bordered by fountains, and the two grand avenues lined with trees, and beyond all these knots of flower-beds was the great court, with open railing, where the sentinels stood, within which, and beyond the moat, lay the vast palace with its Ionic pillars, clock turret, statues and trophies, its stone urns and high-pitched roofs. Great gilt coaches, large as arks, were moored in the court. Sedan-chairs were there, with their sturdy bearers resting on the handles. Groups of courtiers and ladies filled the walks or stood bantering each other round the fountains. Lacqueys ran about excitedly, longing for orders, fresh from card-parties in rooms hung with tapestry or encumbered up to the ceiling with formal giants and demonstrative allegories.

Church Planning.

The usual division of a church into the nave and side aisles appears to have had its origin not in symbolism but in fitness. In vaulted churches the span from wall to wall would be excessive, and large buttresses would be required to resist the thrust of the vaulting; and a similar difficulty would be experienced

with the timber roof at a time when constructive carpentry was in a very low state. But the division of the span into three intervals removed these difficulties, and the introduction of the clerestory windows assisted the illumination of the building. The accession of dignity which was thus gained was an accidental accompaniment of this constructive excellence, not the essential feature of the design, to which economy, stability and convenience—in a word, fitness—was to be sacrificed. If, however, we examine most of the churches built since the accession of the Tudors, we find this principle of fitness, and of the subserviency of appearances to convenience of plan or constructive excellence, egregiously violated. St. Paul's Cathedral is a remarkable example, for here, as has been well observed, "one half of the church is built to conceal the other." Here the architect has been so faithless to his great scientific talents, and so unaware of the source of true architectural effect, as to conceal all his constructive resources and to mask his transcendent abilities, as though he was ashamed of his glorious handiwork. The division of the church into a nave and side aisles involves the introduction of intermediate supports—a necessary evil in those days, and but little felt in a service whose influence was so dependent upon ceremonial observances, the effect of which would be rather heightened than impaired by such an arrangement. But in Protestant churches, particularly amongst the Dissenters, the interest of the congregation is concentrated upon the pulpit and the reading-desk. It is desirable, therefore, that the audience should have an unimpeded view of the officiating clergyman; and intermediate supports should be avoided, as they either conceal the pulpit from a portion of the audience, or else, if placed in the aisles, impede the passage or necessitate the loss of space. The introduction of the essential features of one class of religious edifices into churches whose ceremonial is independent of such accessories is in bad taste, as suggesting discordance and controversy where harmony and unison are most desirable. In like manner, the formation of niches without statues, and where there is no probability of statues being provided at any time, is objectionable, as suggesting a feeling of incompleteness where, in fact, all is done that is intended. And thus that which is an agreeable feature when justified by its application to legitimate purposes—*i.e.* when fitly introduced—becomes by its misapplication evidence of the architect's want of resource and taste.

Francia the Painter as a Type-cutter.

From the invention of printing to a period not far removed from our own time the cutters of punches were goldsmiths, minters, niellists—consummate masters in the art. We find in Zani that Fust and Schoeffer were goldsmiths, as it is thought Gutenberg was also. Zani is also of opinion that Giovanni Dunne, "bravissimo orifice," was he "who led the way in forming types of metal." Emiliano Orfini, of Foligno, the partner of Numeister, was a minter, and of a family of minters. Bernardo Cennini, who cut the punches for the types with which the "Servio" was printed at Florence in 1471 and 1472, was a goldsmith, and Jensen was a minter at Tours before he became a cutter of types. Pomponio Gaurico, in his little work "De Sculptura," printed for the first time in Florence, in 1504, mentions as celebrated engravers two of his contemporaries, Caradosso and one Franciscus Furnius Bononiensis. What other writer has even spoken of a Francesco Furnio or Forni Bolognese, an artist equal to Caradosso? Mariette ("Traité des Pierres Gravées") made a good guess when he condemned the name of Furnius as an error, and suggested that it ought to be read "Francia." Every one knows how distinguished Francia was in goldsmith's work, his first and principal profession, and how often he signed his pictures with the words "Franciscus Francia Aurifaber" or "Aurifex." Vasari, in his "Life of Francia," says that his beautiful medals will bear a comparison with those of Caradosso, but he says not a word of the imaginary Furnius of Gaurico. There is no doubt that Francesco da Bologna was no other than Francesco Raibolini Bolognese, commonly known as "Il Francia." Camilli Leonardi, in his "Speculum Lapidum," after having named various ancient sculptors precisely in the same manner as Gaurico, proceeds to speak of the moderns, and says, "I find one process among the moderns of which no mention is made among the ancients, in speaking of the engravers or sculptors in silver, which species of sculpture is called niello. I know a man very celebrated and extremely skilful in this art, named Franciscus Bononiensis, otherwise Frazza (Frazza or Franzam), who draws or engraves on one small globe or plate of silver, so many men, animals, mountains, trees, castles, and in such different ways and positions as is wonderful to be told and to behold." Francesco Raibolini, then, was known in his time as Francesco da Bologna or Bolognese, otherwise Francia or, in the Bolognese dialect, Franza. The direct testimony of Leonardi is corroborated by an irrefragable and remarkable circumstance. In the preface to his "Petrarch" Francesco da Bologna promises to print in a similar style and type the Italian poets

and also the Latin classics. Nevertheless, we have from him only five little volumes—four Italian and one Latin, which is the last in chronological order, and bears the date of December 20, 1516. It could not be otherwise, for Francia ceased to exist on January 5 or 6, 1517. Francesco da Bologna was, therefore, Francesco Raibolini, called "Il Francia," the worthy contemporary and compatriot of Leonardo, Raphael, Michel Angelo, a great painter, great engraver, great minter, great niellist, an unequalled cutter of types for printing, a conspicuous ornament of illustrious and learned Bologna.

Indian Mortar.

The lime used in India is peculiar and is called "khunkur." It is picked up in the beds of rivers and small streams after the rains, and is found sometimes in isolated beds; but generally it is in detached masses composed of pieces of about the size that stone is broken for metalling roads. It is of a light grey colour, and is burnt in the usual way, either in heaps or in kilns, the latter being preferred; and the percentage obtained is generally about 55 per cent. The mortar used is generally made of 1 part of lime to 1 or 1½ parts of "soorkee," which consists of bricks pounded and passed through a sieve of eight meshes to the inch; this mortar is of the best description, being hydraulic, and setting almost better in water than out of it. No sand is found in India sufficiently sharp for making mortar, hence the use by the natives in the first instance, and now by Europeans, of brick-dust, as it may be called, in place of sand for making mortar.

The Circular Saw.

One of the most useful machine tools that made its appearance at the end of the eighteenth century was the circular saw. This had been applied to cutting metal on a small scale, as in the cutting-engine, ever since the time of Dr. Hooke—if, indeed, these early examples were not more like circular files than saws. Where or by whom the wood-cutter's saw was put into the form of a revolving disc has not been recorded. It found its way into this country about 1790, some say from Holland, and was employed at Southampton and elsewhere in wood mills. Bentham greatly contributed to the practical arrangements necessary to give it a convenient form. He describes and claims the bench now universally used, with the slit, parallel guide and sliding bevil-guide and other contrivances. Brunel introduced a variety of ingenious and novel arrangements, as well as the mode of making large circular saws of many pieces. Mr. Smart also contrived series of sawing-machines for making canteens, cutting tenons, &c.

The Discovery of The Mausoleum.

When the Knights of St. John had arrived at Mesy (Budrum), they at once commenced fortifying the castle, and looking about for stones wherewith to make lime, found no more suitable or more easily got at than certain steps of white marble, raised in the form of a terrace (*perron*) in the middle of a level field near the port which had formerly been the great Place of Hali-carnassus. They therefore pulled down and took away these marble steps, and, finding the stone good, proceeded, after having destroyed the little masonry remaining above ground, to dig lower down in the hope of finding more. In this attempt they had great success, for in a short time they perceived that the deeper they went the more the structure was enlarged at the base, supplying them not only with stone for making lime, but also for building. After four or five days, having laid bare a great space one afternoon, they saw an opening as into a cellar. Taking a candle, they let themselves down through this opening, and found that it led into a fine large square apartment, ornamented all round with columns of marble, with their bases, capitals, architrave, frieze and cornices engraved and sculptured in half-relief. The space between the columns was lined with slabs and bands of marbles of different colours, ornamented with mouldings and sculptures, in harmony with the rest of the work, and inserted in the white ground of the wall, where battle-scenes were represented sculptured in relief. Having at first admired these works, and entertained their fancy with the singularity of the sculpture, they pulled it to pieces and broke up the whole of it, applying it to the same purpose as the rest. Besides this apartment, they found afterwards a very low door, which led into another apartment, serving as an antechamber, where was a sepulchre, with its vase and helmet (*tymbre*) of white marble, very beautiful and of marvellous lustre. This sepulchre, for want of time, they did not open, the retreat having already sounded. The day after, when they returned, they found the tomb opened and the earth all round strewn with fragments of cloth of gold, and spangles of the same metal, which made them suppose that the pirates, who hovered along this coast, having some inkling of what had been discovered, had visited the place during the night and had removed the lid of the sepulchre. It is supposed that they discovered in it much treasure.

NOTES AND COMMENTS.

WHAT appears to be a new system of architectural competition has been introduced in New South Wales. An enterprising tailor in Hay announced that, as he could not design a building to advantage, he wished to have drawings of stables and sheds to accommodate eight horses, three carts and two buggies. He offered in return a suit of clothes selected from his stock. The plans which were successful were marked "12 years' experience." The *Building and Engineering Journal*, of Sydney, in commenting on the case, says:—"It almost seems as though the profession had successfully passed the late serious crisis in its affairs, which has seen the best of men almost starving, and that the near future promises a return to the primeval system of exchange, with the happy freedom from professional usages and Institute rules which mark this most important event. Colonial tweeds will improve in demand surely. The next thing we may expect to hear of in this line is that some publican in the same thirsty region advertises for plans and supervision of building operations, and offers in return so many daily potations of tanglefoot, or overproof rum." Apparently, the suit of clothes is to be taken from the ready-made stock, and the tailor ought at least to have the courtesy to announce he would take the measure of the architect. It is a pitiful case, but it indicates that building owners in Australia as in Great Britain have a knowledge of the state of the professional market, and are resolved to profit by the excessive supply.

AN architect's certificate is always treated with befitting reverence in a law court, and the wit of man does not appear to have discovered any device by which it can be set aside. A coach and six can, it is said, be driven through every clause of every Act of Parliament if a driver of the right sort can be secured, but no king's or queen's counsel with the aid of a troop of horses can make a certificate less binding on the parties concerned in it. A few days ago it was decided in the Matlock County Court that an architect cannot diminish the value of the document by any subsequent statement. A firm of builders claimed 19*l.* 6*s.* 7*d.* as balance of account for additions to one of the numerous hydropathic establishments in that charming district. It appears that the extras on the contract, as certified by the architect, amounted to 259*l.* 16*s.* 7*d.* The builders agreed to accept 250*l.* if the money were paid at once. A sum of 240*l.* was given to them. As they could not obtain the balance they were obliged to sue for it. The defendants pleaded that the contract was not stamped. The judge overruled the objection on the ground that there was admission of the work being done, and, moreover, the architect had certified it was finished. The architect was then brought up to testify about some work being still incomplete, and how he had told the builders not to present the certificate until all was carried out to his satisfaction. In reply to the judge, he admitted that the certificate was not entirely accurate. The judge said there was no getting over the certificate, which declared that the work was complete in September last. It was right to withhold some money for unfinished work, but the acceptance of 250*l.* for an account amounting to over 259*l.* was evidence that a sufficient allowance had been already agreed to on that head. His Honour, therefore, held that, in addition to the 7*l.* 7*s.* 3*d.* lodged in court, a further sum of 10*l.* must be paid. The amount in dispute was not large, but the decision that an architect cannot explain away his own certificate is important. We believe the only judgment to the same effect has been given in the Supreme Court of New York.

A COMMITTEE of the Bolton School Board lately came to the conclusion "that only the architects of Bolton who have already had experience in building modern elementary day schools be allowed to send in plans for the proposed Central Higher Grade School; and that premiums of 50*l.*, 25*l.* and 10*l.* respectively be paid to the architects whose plans are awarded first, second and third places in order of merit, the first sum of 50*l.* to be merged in the architect's commission if those plans are accepted." When the subject came before the Board for confirmation a discussion arose. One member proposed as an amendment that the recom-

mendation should be rejected, on the ground that as there was to be an assessor there was no necessity to limit the number of designs, which would be also unfair to the younger members of the profession. The Chairman of the Board said he had tried to have the competition still more restricted, viz. to architects who had received commissions from the Board, and he related how the architect of the Department had pointed out the disadvantages of open competitions. A majority of the members were in favour of the amendment. The proposal confirms what we said last week about the endeavour of local authorities to escape from work that is troublesome to themselves. The building committee were eager to have few plans, but the Chairman and his friends wished for fewer still. It may be offered as an excuse that the members of the Board are not paid for their services. That argument does not, however, apply either to the assessor or to the architect of the Education Department. If any advantage could arise to the public from allowing only a favoured few to compete, the arrangement would find general support; but when it is manifest that paid and unpaid officials are merely eager to spare themselves, means should everywhere be adopted to baffle their scheme. As long as plans are prepared without cost to Boards, it is the least we may expect that they should receive attention.

THE example set by the Office of Works and some municipal bodies in dabbling with contracting is being imitated in places where it is not necessary to bid for the votes of the working classes. A new example is the Mersey Docks and Harbour Board. At a late meeting the following recommendation of the works committee was brought forward:—"To raise the quay on the north side of the Egerton Dock, Birkenhead, and to erect thereon a corrugated iron shed 570 feet in length and 80 feet in width, with the necessary lines of rails, and a roadway 20 feet in width in connection with the proposed shed, at a total estimated cost of 13,350*l.*; and to raise a portion of the quay on the north side of the Hornby Dock and to erect thereon a shed 900 feet in length and 150 feet in width, with certain hydraulic cranes, and a roadway 50 feet in width, adjoining the shed, at a total estimated cost of 51,500*l.*" It appears that the committee were not agreed whether the work was to be tendered for or carried out by the Board without a contractor. The Chairman, in introducing the proposal, said that, as one who watched dock work closely, he should not be at all surprised, if the whole of the work were done by tender, to go down some morning and find the shed and the quay in the middle of the dock. It would not be the first time such a thing had happened. He went on to say that since he had been Chairman of the works committee they had often accepted tenders, and although they naturally accepted the lowest tender, he had felt more than once that they were acting injudiciously in doing so. From the facts before him he thought the Board would make a great mistake in accepting a tender in the present case. An amendment was proposed to the effect that tenders should be obtained for the erection of sheds on the north quay of Hornby Dock, and it was carried by a majority of one. It is quite evident that a prejudice is being created against contractors, and as the societies appear to be indifferent to the allegations, we must not wonder if the public are coming to the conclusion that contractors are incompetent and rapacious and that economy will be insured by dispensing with them.

THE spring exhibition of the Manchester Academy of Fine Arts closed on Saturday last. Forty-six pictures of the value of 960*l.* were sold. The next exhibition of works of modern artists will be opened on September 4, closing on Saturday, January 5, 1895. It will comprise paintings in oil and water-colour and sculpture only, pastels, architectural drawings, and works in monochrome not being admissible. The art gallery committee will have professional assistance in the selection and hanging of the works. The sum of 2,000*l.* per annum, with the net profits arising from exhibitions, can be employed by the committee for the purchase of works of art for the permanent collection, and during the last eleven years the sum of 31,145*l.* has been so expended.

TUDOR HOUSE, HAMPSTEAD.—GARDEN FRONT.

NEW SCHOOL, ARMADALE, WEST LOTHIAN.

IN the plan of this school it will be seen complete cross ventilation is provided for, and there is the minimum of occasion for using one classroom as a passage from another. The cost will be about 2,500/. The builders are MESSRS. WILSON & WALLACE, West Calder, and Mr. WEBSTER, Bathgate; and the architect is Mr. GRAHAM FAIRLEY, Edinburgh.

THE AGE OF THE REFORMATION.

THE painting which is the climax of KAULBACH's series in the Berlin Museum presented more difficulties than the others. In the first place he had to determine who were the best entitled to be considered as the representatives of the Age of the Reformation. On that subject he was not likely to find many scholars who would agree. In England, some half-dozen men at the most would be put forward as the motive powers of the Reformation. But our insular simplicity would not satisfy the humblest classes of the Germans, who are aware in the first place that LUTHER and CALVIN, with their associates, took up the contest which had been commenced long before they were born; and secondly, that the theological combatants were only a part of the great army engaged. A broad view of the Reformation necessarily made a choice of figures still harder. As the painting was to be seen mainly by Germans, it was necessary to emphasise the share taken by their countrymen, not only on both sides among theologians, but also those who fought under the banners of art, science and literature. At the same time, justice demanded that the services of Italians, Frenchmen, Dutchmen, Englishmen, &c., should be suggested. As space could not be limited to Germany, so time must include a wider era than the age of LUTHER and CALVIN. Accordingly we find that KAULBACH introduces ABELARD, the schoolman, who was born in 1079, and WILLIAM HARVEY (the discoverer of the circulation of the blood), who was born in 1578. CALVIN and LUTHER did not live much beyond a half century, whilst KAULBACH's Age of the Reformation extends over five centuries. He is no less uncircumscribed in respect of creeds, for a Jesuit is seen in the foreground, and there is a liberal supply of the advocates of the papal and other conservative principles throughout. The important conclusion which GOETHE says should be drawn from the struggle is a conviction that the World-spirit is tolerant, and therefore many things which are essentially opposed to one another can and must exist side by side. KAULBACH was probably of the same mind when in the very centre of his painting he makes MELANCHTHON unite in friendly embrace with the Lutheran and the Imperialist envoys over the agreement for peace concluded at Augsburg. When KAULBACH had at length decided on the figures that were to form his quadrivium of theology, art, literature and science, the next question was how he was to arrange them. He does not conceal that he was indebted to the *School of Athens*, for he introduces a sketch of that work in RAPHAEL's hand. LUTHER takes the place of PLATO, and HANS SACHS the seat of DIOGENES in the older picture. On the upper platform are the theologians and some of their pious supporters, on the right are the artists, on the left the followers of astral science, while in the foreground are the scholars and writers and the students of terrestrial science. We shall now endeavour to indicate the individuals who are represented.

On the seats which flank the copy of DA VINCI's *Last Supper* are early reformers. The bearded patriarch at the extreme end on the left is JOHN WYCLIFFE, who was taught in Merton College, presided over Balliol, and held the living of Lutterworth. The painter did not know that WYCLIFFE always wore a coarse russet gown and went barefoot. Next to him is GEILER VON KAISERSBERG, one of the mystics who preached in Strasburg. His discourses have still some literary interest, for many of the ideas were derived from BRANDT's "Narrenschiff" (Ship of Fools). He is seen pointing out a passage in a book to JOHANN WESSEL, of

Gröningen, a monk who is described by HALLAM as "one of those who contributed most steadily towards the purification of religion, and to whom the Greek and Hebrew languages are said, but probably on no solid grounds, to have been known." The unfortunate JOHN HUSS touches WESSEL and points towards LUTHER. He suffered at the stake for upholding WYCLIFFE's doctrines, although protected by the emperor's safe-conduct. The stout Rabelaisian figure at the other side of the central picture is PETER WALDUS, or VALDO, the Lyons merchant, whose followers are now known as Waldenses. He is talking with ARNOLD of Brescia, who, like HUSS, suffered at the stake. Beside ARNOLD is his master, PETER ABELARD, the great logician who said of himself, "I preferred the armour of dialectic warfare to all other modes of philosophy; for it I quitted the military life, choosing rather the conflicts of disputation than the trophies of real battle." The figure with the uplifted arm is the Dominican Friar SAVONAROLA, the Florentine martyr. Like so many of the reformers, he could not appreciate the Renaissance spirit, and he exerted his influence against literature and art. In one of his discourses he said, "In the houses of great prelates and great doctors nothing is thought of but poetry and rhetoric. You will find them with books of polite literature in their hands, with VIRGIL, HORACE and CICERO to prepare themselves for the cure of souls." Divines might be less profitably engaged than with the classics, but to a severe man like SAVONAROLA intellectual enjoyment is a crime. Last comes JOHN TAULER, another Dominican, and the best known of the fourteenth-century mystics. According to WACHLER he was the first that wrested from German speech the fit expression for ideas of moral reason and emotion, and has left riches in that kind such as the zeal for purity and fulness in our days cannot leave unheeded.

In the centre of the next row stands LUTHER, who elevates the Gospel as a pharos. On his right is his faithful friend JUSTUS JONAS; on the left, holding a book, is ULRIC ZWINGLI, who claimed to have anticipated LUTHER in the demand for reform. The minister who gives sacramental bread to four Rathsherren, counsellors or elders, is JOHN CALVIN. Awaiting their turn are Admiral COLIGNY, who is in armour (the bent head recalls MACAULAY's line, "Good COLIGNY's hoary hair all dabbled with his blood"); MORITZ of Saxony, in a plumed beaver (a prince who thought only of the main chance, for, as CARLYLE says, he "kept his Electorship, and by cunning jockeying his Protestantism too, got his junior line pushed into the place of the first, in which dishonourably-acquired position it continues to this day"), a Huguenot gentleman and a French peasant. Then we see the English contingent advancing. Queen ELIZABETH leads the way, and is followed by DRAKE, BURLEIGH and ESSEX; a monk, an old man helped by a boy, and another man, represent the English people. CRANMER appears as a tall figure carrying a Bible; behind him, with clasped hands, is Sir THOMAS MORE. The two figures approaching the dais towards the centre of the painting are WILLIAM OF ORANGE and his councillor OLDEN BARNEVELDT.

On the right of LUTHER we see JOHN BUGENHAGEN, one of the translators of the Bible, offering the cup to two Saxon princes. The elder, JOHANN der Beständige, is described by CARLYLE as "a wise and eminently Protestant man, though dreadfully fat, so that they had to screw him up by machinery when he wished to mount on horseback." The son, JOHANN FRIEDRICH, der Grossmüthige or Magnanimous, who wears his cap, was not fortunate in this world, for, says the historian, he lost the Electorship, and his line "split itself after him into innumerable branches, who are all of a small type ever since." The three figures behind are Rathsherren. The clerical bearded figure, with folded hands, is Hochmeister ALBRECHT of Brandenburg, who "early shone in his exercises, spiritual and bodily, above all his fellows, expert in arts, especially in arms," and from his appearance was made Grand Master of German knighthood. Some thought he was a sham; but, although much given to theology, and therefore bewildered in casuistry, he contrived to overturn the knighthood of which he was Grand Master, and to gain possession of Prussia for his family, the HOHENZOLLERN. CARLYLE's sketch of him as "a man with high bald brow, magnificent spade-beard, air much

pondering, almost gaunt—gaunt kind of eyes especially, and a slight cast in them, which adds to his severity of aspect," corresponds with KAULBACH'S figure. The brave-looking man in armour will at once be recognised as GUSTAVUS ADOLPHUS. To the majority of Britons he probably becomes interesting because the redoubtable Major DALGETTY served under him as Fahndrager, and was always ready to extol the invincible monarch, the bulwark of the Protestant faith, the Lion of the North, the terror of Austria.

In the sort of chancel aisle assigned to astronomy we see COPERNICUS, the Prussian, drawing a diagram explanatory of the Pythagorean system he revived, in which the planets were proved to turn round the sun. His book, which was printed in Nuremberg in 1543, was dedicated to Pope PAUL III. The "starry GALILEO," who adopted the system, is seen leaning on his telescope. On one side old TYCHO BRAHE, the Dane, is discussing a problem with JOHN KEPLER and a monk. At a table is seated JEROME CARDAN, the algebraist, physician, naturalist, astrologer, who was one of the chaotic spirits of the sixteenth century. Ascending the stairs is GIORDANO BRUNO, who upheld the infinity of the universe and the plurality of worlds, which were ascribed to the operations of an abstract principle which was the soul of all things. According to WHEWELL, he probably had a considerable share in introducing the opinions of COPERNICUS into England. In this country, as in France, BRUNO was safe, notwithstanding his pantheism, but on returning to his native country, Italy, he was seized as a heretic and was burnt in 1600.

The right aisle becomes the studio of ALBERT DÜRER, who is supposed to be engaged in painting his figures of the Apostles. He turns round at the announcement of his colour-grinder about the arrival of visitors. Who are they? THACKERAY says that he should like to have been SHAKESPEARE'S shoeblack, and to have run on his errands. In a similar spirit, KAULBACH has painted himself as DÜRER'S colour-grinder. The visitors he announces are no less than DA VINCI, RAPHAEL and MICHEL ANGELO. PETER VISCHER, who is at home there, looks on in the attitude in which he appears in Nuremberg. Here also we find the printing-press. GUTENBERG, of Mentz, is supposed to have pulled a sheet of his Mazarin Bible, which he has affixed to a column. LORENZ KOSTER, of Haarlem, who is believed by many investigators to have been the original inventor of the art, stands beside him holding a forme in his left hand, and the original "printer's devil" (he is now only a Lauffbursche) looks on admiringly at the product of his inking.

The transition from the printers to scholars and humanists is easy. The group which represents literature is unlike the others, for it is hard to say who is the supreme figure in it. On that account it is, perhaps, more characteristic of authorship. We see ERASMUS with outstretched hand expounding CICERO. Beside him, as if ready to take his place, stands REUCHLIN, who was as well versed in Greek and Hebrew as any man in the fifteenth century. PETRARCH seems to be no less anxious to have the merits of HOMER appreciated. It may be doubted whether the sonneteer and lover of LAURA was competent to be a professor of Greek. ERASMUS said that PETRARCH did not possess full acquaintance with the language. In his letter acknowledging a copy of "Homer" that was sent to him from Constantinople, he said:—"HOMER is dumb or I am deaf; it is not in my power to enjoy the treasure. As often as I embrace the silent volume I exclaim with a sigh, 'Illustrious bard, with what pleasure should I listen to thy song if my sense of hearing were not obstructed?'" The listeners consist of SHAKESPEARE and CERVANTES, who are far more illustrious than the teachers, besides PETER DUMOULIN MOLINEUS, a French Protestant divine, who, from his head-dress, might be taken as belonging to CHAUCER'S age, although he lived up to 1658, and the versatile CREBS, or CASANUS, who was geometrician, theologian, diplomatist, and won a cardinal's hat. He was a Frenchman, and his countrymen believe he revived the Greek theory of the revolution of the earth before COPERNICUS. Next to him is the laurel-crowned and mail-clad ULRIC VON HUTTEN, who, like KÖRNER in the nineteenth century, was a soldier as well as a poet, and is therefore one of the favourite figures in modern German decoration, as he is one

of the idols of German students. Seated on the ground in front of SHAKESPEARE is HANS SACHS, shoemaker and Meistersänger, of Nuremberg, or as the old doggerel expressed his versatility:—

Hans Sachs, der war ein Schuh-
Macher und Poet dazu.

About his productivity there could be no question, for it is recorded that he left behind him two hundred and eight plays, seventeen hundred comic tales and between four and five thousand lyrics. Near PETRARCH is JACOBUS BALDE, the Jesuit. Fortunately for his reputation somebody styled him the German HORACE, and accordingly he is represented as trying to awake the ancient lyre. HALLAM, who had the courage to read the eight books, says the odes are tumid and unclassical. On the other side of PETRARCH is PICO of Mirandola. The late Cardinal NEWMAN, in explaining the effects of the excitement of the Renaissance, speaks of him as "a youth of twenty, who exhibited himself at Rome as the master of twenty-two languages, and proposed nine hundred subjects for disputation." But, astonishing as may have been his ability, there is nothing left by which its value can be tested. As a collector of manuscripts he was most easily deceived, and spent a fortune on rubbish. Looking towards him is seen the head of VIVES, the Spaniard, who was professor at Oxford in the time of HENRY VIII., and tutor to the Princess MARY. He was turned out of England for supporting the cause of Queen CATHERINE. Behind is FICINUS, who might be said to have made a god of PLATO in the fifteenth century, and who maintained that the doctrines of the Greek should be taught in all churches. Standing near PICO is MACHIAVELLI, and the cowed figure represents a still greater man, the renowned Dominican CAMPANELLA, who was the precursor of BACON in upholding the necessity of experimental inquiries for all who wish to study nature. Modern socialism, or something resembling it, is to be found in his "City of the Sun." Although he advocated universal monarchy under Rome, the imaginative philosopher was not saved from spending a quarter of a century in prison.

COLUMBUS is the central figure in the corresponding group. In front of him stand LEONARD FUCHS, with a flower in his bonnet, one of those lucky men who, like SHAKESPEARE, have no need of marble monuments, for the fuchsia is his memorial; the bald PARACELSUS, who was a genius, although he could not renounce charlatanism; and the astonished SEBASTIAN FRANK, who preached and printed, wrote histories and geographical treatises. The bent old man, with spectacles on nose, who measures distances on the globe, is SEBASTIAN MUNSTER, the "Father of Knowledge"; and the fine kneeling figure beside him, who might be taken for RALEIGH, on account of his rich cloak and his interest in the use of the globes, is Lord BACON. The young man at the right of COLUMBUS is MARTIN BEHAIM, of Nuremberg, a traveller who obtained a gold chain from the King of Portugal for his discoveries. Behind is the English surgeon, WILLIAM HARVEY, and ANDREW VESALIUS, the Fleming, who was the first of modern anatomists.

It was no easy task to ascertain the qualities of the famous people that were to be introduced in the picture, in order to suggest their characteristics. To investigate how far KAULBACH has succeeded in that part of his work would need a volume, and we have already exceeded our limits. It will be evident to everyone who considers the subject, that paintings which are inspired by an endeavour to represent the greatest actors in the most memorable scenes of the world's history must exert an influence on successive generations which is impossible with works that are designed merely for the gratification of sense. KAULBACH is a teacher as well as an accomplished artist. On account of that duality there is no collection of plates which is better adapted to become a household treasure in all lands than those which Herr DÜNCKER, of Berlin, has brought out from KAULBACH'S series in the new Berlin Museum, and which have the additional value of being masterpieces of the art of engraving.

Mr. Swan, A.R.A., will probably be able to complete his painting *Orpheus and the Beasts* for the forthcoming Academy exhibition.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

It was announced that a meeting would be held that night fortnight to have a debate on the County Council's Buildings Bill.

Messrs. T. P. Stokes and S. Wilkinson were elected members.

Mr. P. E. Masey read the following paper on

Architecture in the East End.

MR. MASEY said:—A short time since I inquired of an architectural friend whether he knew East London. He replied readily in the affirmative, saying he had seen it from the railway carriage when passing through, on his way to Great Yarmouth. And certainly the panorama so obtained is in many ways sad and depressing enough to extinguish any curiosity to make its further acquaintance. Taking an average dull day for the view (for the weather in this part seems somehow generally dull), the spectator may behold a picture in which the prevailing tones are mournful greys and drabs, and the details seemingly composed of endless rows of mean dwellings separated by still meaner courts and back-yards. Here and there Board schools and mission churches in severe stock brick break the monotonous level of pantile roofs. Beyond these a fringe of chemical works, rag yards, rope walks and the like, then an horizon bounded by factories, warehouses and railway sheds, with a few spires and some huge cubes of brickwork, called "model dwellings," interspersed. Above all smoke, smoke everywhere, rising from the countless rows of red chimneys to mingle with the larger streams issuing from the factories, and then melting imperceptibly into the dull, murky atmosphere which overlays this region like a large grey blanket.

There must be many here who know that this description is in no way overdrawn. It is a picture which is eloquent of the sad, dull and unlovely lives passed by many of the inhabitants, and which for unmitigated hideousness cannot, I imagine, be surpassed and, I trust, scarcely equalled. I have ventured to remind you of this, the present aspect of East London, in order to draw attention to the extraordinary change in character and aspect which this district has undergone during the past century and a half. It is most difficult to realise how comparatively modern is the unsavoury reputation which it bears. In endeavouring to put this fact as forcibly as possible before you this evening, I feel that I am only doing my subject bare justice, for this district has played an important part in London history for 800 years, and was the chosen spot for the residence of the wealthier inhabitants for centuries before what is now called the West End had emerged from its primitive state of meadow and marsh.

Before proceeding to describe the few remains of old architecture in East London, I should like to sketch, as briefly as possible, the rise and growth of Stepney, as we are able to gather it from the earliest records up to the present time. The history of Stepney is the history of East London.

Mr. Besant, in his admirable book "London," shows that the deserted Roman city was invaded, refounded and practically re-peopled by the East Saxons. Miletus became its first bishop in 604, and soon after that we have information relating to Stepney from which we may gather that its history is nearly contemporary with that of London itself. It is interesting to note traces of the East Saxon character plainly discernible down to the present day amongst the inhabitants of the East, and Mr. Besant points out that the so-called cockney accent is really nothing more or less than pure Essex dialect. As far back as Saxon times we have records of the Manor of Stebenhythe spelled in half a dozen ways. The manor extended eastwards from the City to the river Lea, and was bounded on the north by what is now Hackney parish, and on the south by the river. When Domesday was taken, Stepney Manor is described as part of the ancient desmesnes of the Bishopric of London, and valued at 48*l.* per annum. The manor house stood a quarter of a mile north-east of what is now Bethnal Green. The Saxon church was called All Saints. Dunstan was made Bishop of London in 957, and probably for a time lived in Stepney. He built the church, and to his memory it was afterwards dedicated.

The derivation of Stebenhythe is supposed to be from Steb, the trunk of a tree, and Hythe, a wharf. The following description by Fitz Stephen in Henry II.'s reign probably includes Stepney:—"On all sides without the houses of the suburbs are the citizens' gardens and orchards, planted with trees, both large, slightly and adjoining together beyond the pastures and plain meadows." Towards the north he described the meadows as "having brooks running through them, turning mills with a pleasant noise," and further, "a great forest, a well-wooded chase having good covert for harts, bucks, does, bears and wild bulls." The Bishops of London seemed to have found Stepney a pleasant place, for they constantly resided there between the eleventh and fifteenth centuries. We read that one of them

tried to make a game preserve here in 1252, but the mayoralty of London, already a rival power, effectually opposed and prevented it, so that the said bishops had to content themselves with tournaments, which were for long after held at Bishops' Hall, the name by which the manor house was known. In 1299 the king held at Stepney a parliament in the mansion of Henry Walters, Mayor of London, on Mile End Green, on which occasion the Charter of Liberties was confirmed. Up to this time there is not very much information to be gathered about Stepney, and it was probably a small and somewhat unimportant place, but from about 1300 its active history may be said to commence. It is interesting to note how early the inhabitants showed their independent nature and demonstrating capabilities from the fact that in both the insurrections of Wat Tyler and Jack Cade they played a conspicuous part. The first step towards the division of Stepney was taken early in the fourteenth century, when the White chapel, called St. Mary Matfelon, was built as a chapel of ease. Soon after (1338) it became a parish to itself. The origin of the name is unknown, though there are several more or less improbable traditions to account for it.

About this time the inhabitants of the eastern portion of the parish, called Stratford Bowe, being frequently unable to attend church owing to the flooding of the fields by the river Lea, a chapel was built and provided with a curate for their accommodation. The name of Bow is stated by Leland to be derived as follows:—"Matilda, wife of Henry I., having herself been well washed in the river, caused two bridges to be built in a place one mile distant from the Old Ford, of which one was situated on the Lea at the head of the town of Stratford, now called Bowe, because the bridge was arched like unto a bowe, a rare piece of work, for before that time the like had never been seen in England." Early in the fifteenth century the bishops ceased to reside in Stepney, but the spot had become a favourite one for the country houses of the richer London merchants.

The reign of Henry VII. saw the rise and development of two great movements, in both of which Stepney played a conspicuous part—the pre-Reformation efforts for religious reform and the development of the navy. Regarding the former several Stepney vicars stand conspicuous. Bishop Fox, a great patron of the new learning; Dr. Heynes, who was sent abroad to confer with Melancthon; Dean Colet, a leader of advanced thought, and founder of St. Paul's School; William Jerome, who paid the price of being before his time by being burned at Smithfield in 1540, and several others.

The spirit of independent thought seems early to have taken firm hold of Stepney, for it afterwards became a stronghold of Puritanism. Respecting the second influence under which Stepney developed, the demand for ships soon caused houses, yards and stores to creep along the river bank, although the country behind between them and the Mile End Road did not alter its rural character for many a century afterwards. The result of this growth of naval enterprise was Ratcliffe, Blackwall and Deptford. At Deptford was built the famous *Great Harry*, which was commanded by Sir Thomas Spert, who also founded the Trinity House, and who was buried in Stepney Church. At Blackwall, some little time after, was built the Brunswick Dock, which was the commencement of the magnificent series which now lines the river bank. In 1550 the manor of Stepney passed away from the Bishops of London after having been held by them nearly 600 years. Nicholas Ridley, Bishop of London, alienated the manor from the see and gave it to Edward VI., who granted it immediately to Thomas, Lord Wentworth.

At this time the manor included several smaller manors, villages and hamlets, which one by one were detached and became separate parishes. The principal of these were Shadwell (Great Chad's Well), Spitalfields, Limehouse (Lymehurst), Stratford, Bowe (Bow), Bethnal Green and Poplar or Popler. In 1625, and again in 1665, Stepney suffered exceptionally from the Plague, although this was probably due to its close connection with the river trade and the foreign shipping rather than from any inherent unhealthiness in the place itself. In spite of these calamities the locality continued a fashionable one. In 1663 the Marquis of Worcester built his mansion on Stepney Green, and we read that in the following year the king instituted a weekly court of record within the manor and granted a weekly market at Ratcliffe Cross, as well as a Michaelmas fair on the Green. Of these privileges one at least survives in the Haymarket still held in Whitechapel. In 1642, when the City was surrounded by a trench, fortifications were made at Mile End, sailors being employed for the work. The fortress, which was intended to defend the approaches to the City from the eastern road, was in the parish of Whitechapel. It was originally made 329 feet in length, 182 feet in breadth and about 25 feet high. The place was levelled to make room for a row of houses at the beginning of this century. The place is called "The Mount," and the rise of the ground may still be noticed. Meantime the riverside hamlets continued to grow in importance. Writing in 1598, Stow com-

plains that "there hath been of late in place of elm trees many small tenements raised towards Ratcliffe, and Ratcliffe itself hath been also increased in building eastward (in place where I have known a large highway with fair elm trees on both the sides), that the same hath now taken hold of Lymehurst, corruptly called Limehouse, sometime distant a mile from Ratcliffe."

Between 1669 and 1743 the districts known as Shadwell, St. George's, Spitalfields, Limehouse, Stratford, Bow and Bethnal Green were detached from Stepney and became separate parishes, owing largely to the increase of population caused by the rapidly-growing trade at the port of London.

During this period, as the following figures will show, Stepney, the mother parish, continued a small place. Between 1680 and 1685 the births averaged 1,380 annually. Between 1790 and 1793 the births averaged 2,260 annually. On the main road, however, between London and Stepney houses were commencing to be built. In 1673 Philadelphia, Lady Wentworth, obtained the king's permission to build upon a piece of land called West Heath, on the road to Stratford Bow. Sir Christopher Wren was employed to survey the ground and give his opinion on the eligibility of the site. We will refer to his report later on when passing the place in question.

Before closing this brief notice of the history of the manor it may be interesting to note its further changes of ownership after having been given, as already mentioned, by Edward VI. to Thomas, Lord Wentworth. From the latter it descended to Thomas, Earl of Cleveland, whose estates were confiscated in 1652. Sir William Ellis, Cromwell's solicitor, was then made steward of the manor, then valued at 200*l.* per annum. After the Restoration the Earl of Cleveland recovered a part of his property, amongst the rest this manor, which remained in his family until 1720. In 1754 it passed to the Colebrooke family, the present lords of the manor. The eighteenth century saw the gradual decline of this venerable suburb from its position as a fashionable locality, although it continued a favourite residence of the middle classes down to fifty years since. The next and last important event in the history of Stepney was the building of the docks to accommodate the enormous expansion of trade with the East and West Indies. Soon after the commencement of these enterprises Stepney, with its mansions and cottages, fields and trees, gardens and pasturelands, disappeared as if by magic, and in its place arose the East London of to-day.

Many were the interesting buildings demolished one by one to make room for the swelling population. In a few cases we have contemporary drawings, more or less authentic, of what then existed, but in many more there is nothing but a meagre record of the fact of their disappearance. In deploring that so little information is handed down to us, it must be remembered that, until comparatively recently, methods of illustration were few and tedious, and the times apathetic in matters artistic. Nowadays, although facilities for obtaining authentic records are great, one has reason to know that much that is historically and architecturally valuable disappears yearly without any such record being made; and although a Government camera could, with small expense and probable profit, perform the needful part in respect to our vanishing old buildings, yet it has been left hitherto to a few disinterested and enthusiastic amateurs to preserve any memorial of them.

In regard to this matter I should like to draw the serious attention of our Camera Club to the fine opportunity here presented to them of doing a really national work. It would be one in which their peculiar knowledge would give them a great advantage, and which, if systematically and thoroughly carried out, would be most valuable, and would earn for them the gratitude of the architectural, archæological and artistic worlds. In the following short and necessarily imperfect description of some of the old buildings remaining in East London, it will be found convenient to take an imaginary journey eastwards from Aldgate as far as Bow, thence to the river, and to return by the river streets to the Tower.

Leaving Aldgate, the gate of the East, behind us, we make our way with difficulty through a busy crowd, which includes Hebrews, butchers, slaughterers, city clerks and Essex farmers, and where railway vans and hay carts, brewers' drays and funeral processions contend with unwieldy trams for the mastery of the road. We should first notice the group of houses on the south side of the street known as "Butchers' Row." Amongst them is a wine and spirit-house of long standing, with a quaint old bar and scoring board. Mansell (or Maunsell) Street leads off to the right. Here several fine old houses of a well-known type still remain. On the north side of Aldgate the last of the historic hosteleries has long since disappeared to make room for improvements. A short distance further east and then the Commercial Road branches off to take the heavy traffic to and from the docks. Here commences Whitechapel High Street. On the left are some houses of Restoration date, which group well with the tower of the new Free Library beyond. Opposite stands the conspicuous spire of St. Mary Matfelon. Of the origin of this strange word there are many explanations, but

none satisfactory. Drawings extant show the old church to have been much of the same type as that of Stepney. There is reason to believe that a chapel existed here long before the fourteenth century when the White-chapel previously referred to was built. Behind the church lies the picturesque and historic bell foundry of Mears & Stainbank, where many famous bells have first seen the light.

A little further on we pass "The Mount," a row of houses on slightly raised ground, which occupies the site of the fort raised in 1642. Beyond is the London Hospital, built by Mainwaring in 1752, and furnished with nearly 800 beds. The exterior is simple and dignified in treatment, and seems to be more suited to its purpose than many more ambitious buildings whose pointed turrets and florid detail sometimes suggest a music-hall rather than a House of Mercy. Within, the upper floors are served by two substantial oak staircases, which also contrast favourably with more modern developments. One of these takes the traffic of half the hospital, and is known not to have been repaired for upwards of fifty years, whilst a stone external staircase close by, built in 1876, and taking only a fourth of the traffic, has had to be repaired twice since its erection. Nearly opposite the hospital starts the old road leading to Bethnal Green. There is little there now to reward a visit, although the neighbourhood was in old days a rival to Stepney in popularity and possessed fine houses in abundance. The name is supposed to be derived from the Bathon family, who held property here in the reign of Edward I.; the memorials of the parish are most interesting, and to do justice to them would need much more space than we have now at our disposal.

The most interesting building in Bethnal Green parish was the residence of the Bishops of London, the ancient Stepney manor house, and known as Bishop's Hall. It was situated about a quarter of a mile to the N.E. of the Green, and remained until 1844, when it was swept away in the making of the Victoria Park. The parish was separated from Stepney in 1743, and the church built in 1746. Amongst other noted buildings were "Kirby Castle," a large house facing the Green, built by John Kirby in the sixteenth century, and a chapel standing at the N.E. end dedicated to St. George.

Both these buildings disappeared about ninety years since. Beyond is Hackney, rich in history and associations; but, as Hackney does not consider herself in East London, we will retrace our steps to Mile End Gate and resume our journey east. Just beyond the curious old inn, standing isolated on the "waste," we reach one of the gems of East London architecture still remaining, the Trinity Almshouses.

These almshouses were founded in 1695 by the Corporation of Trinity House for twenty-four old commanders or mates of ships, their wives or widows. Architecturally these buildings are in their way admirable; the general treatment quiet and unobtrusive, as befitting their use, and the detail excellent and appropriate. The dwellings occupy two sides of a quadrangle, the chapel the third side, and a boundary wall and railing, with handsome gate-posts on the street side, separate the inhabitants from the roar of the Mile End Road. The ends of the dwellings abutting the street are gabled and ornamented with models of ships of the period. The doorways are grouped in couples, each with its flat carved porch; each pair of dwellings share an ornamented lead and cistern placed between them. The centre of each block is treated with a pediment, with carved tympanum. The dwellings were originally returned along the north side to meet the chapel in the centre, but they were demolished to make room for the extension of the buildings at the back. In the centre of the quadrangle is a statue of Captain Sandes, a former benefactor. The glass in the chapel is interesting, it having been taken from the old hall of Trinity House, at Deptford, when it was pulled down in 1786. Adjoining the Trinity on the west side are the Skinners' Almshouses, built in 1698. They are very similar in character to their neighbours. It is much to be regretted that the site has been sold, and that these quaint and interesting buildings will shortly be demolished, to make room for a new Jewish synagogue. Further east on the same side are the Vintners' Almshouses, of later date, and of no architectural interest. It seems a pity that a form of benevolence so satisfactory to all parties concerned should have been elbowed out of fashion by the wholesale system of charity, if I may so call it, nowadays in favour. In Lyson's "Environs" a plan is given of this part of the parish, drawn by Sir Christopher Wren in 1673, who was asked to report upon the suitability of the site for building, by request of Philadelphia, Lady Wentworth, who had obtained the king's permission to build there.

We have now reached the north end of Stepney, or Mile End Green. The Green is now enclosed and planted with flowers, and looks well cared for. There are several comfortable-looking old houses left to remind us of the bygone prosperity, but of the great mansions none remain. The last one—that built by Sir Henry Colet (father of Dean Colet), called Great Place—was cleared away some years since. Hard by was the famous Worcester House, built by the Marquis in 1663, of which the gateway remained in 1810. It stood opposite the

ancient rectory, or church door, near the east end of the church. A little further on, at the corner of Whitehorse Street, was the house given by Dean Colet, when founding St. Paul's School, as a country house for the head masters, and which continued to be used as such until the present century. Nothing now remains of it, but the great name is kept in memory by "Colet Place."

We have now arrived at Stepney Church. In spite of two centuries of tinkering, and its present grimy surroundings, the exterior retains a certain amount of dignity and architectural character. The plan of the present church consists of a chancel, nave and two aisles. It is apparently of late fourteenth-century date, and needs no special comment. On entering the south porch we are reminded of the existence of one of the previous churches by a carved panel representing the Crucifixion, of the twelfth century; there is also the mutilated remains of a holy-water stoup. The first thing to strike one on entering is the hideous gallery over each of the aisles. They are placed so as not to interfere with the nave arcade, and are indications of more prosperous times. The first was erected in 1601, and the other added in 1684 to accommodate the large increase of congregation caused by the Great Fire. In the north porch is another relic of the previous church, *i.e.* a carved panel, too decayed for the subject to be identified. Near the west door the modern Norman font rests on a black marble plinth. This was the tombstone of the infant Lord Darnley, elder brother to James I.'s father. The child was buried beneath the altar whence this stone was removed some years ago, to be put to this not altogether inappropriate use.

The church contains many handsome tombs, chiefly Elizabethan and later. The most noted one is in the north side of the chancel, the altar tomb of Sir Henry Colet, citizen and mercer of London. He was Mayor between 1486-95, and in memory of his more distinguished son, the founder of St. Paul's School, the tomb is faithfully kept in repair by the Mercers' Company. On the south side are thirteenth-century sedilia from the earlier church. Near the Colet tomb is one to Alderman Clark, dated 1510. There are many other interesting graves and monuments in the church, notably to Anne, Lady Wentworth, 1571; John Kyte, Bishop of Carlisle; Richard Pace, Dean of St. Paul's; Nicholas Gibbon, Sheriff of London; Sir Thomas Spert, founder of Trinity House, and many others. The remains of the ancient rood-screen existed till 1621. In 1622 a three-decker was erected, and the King's Arms and the Creed, the Lord's Prayer and the Ten Commandments were put up, says the record, "after a handsome and beautiful manner." During the Plague the churchyard was put to great strain, and a plague-pit had to be made on the north side of Mile End Road. This is shown on Sir Christopher Wren's plan. The Plague records here are very perfect and interesting, and the vestry minutes have been kept with greatest care from 1579. They have lately been carefully edited and printed under the title of "Memorials of Stepney Parish," by the Rev. G. W. Hill and Mr. W. H. Frere, and from which I have gained much interesting information. Before leaving the church we should notice a stone built into the wall near the west door, having the following curious inscription:—

Of Carthage wall I was a stone,
O Mortals read with pity,
Time consumes all—it spareth none,
Man, mountains, time or city.
Therefore, O Mortals, now bethink
You whereunto you must,
Since now such stately buildings
Lie buried in the dust.

THOS. HUGHES, 1663.

After glancing at the interesting collection of maps, prints and relics of Old Stepney Church, preserved in the vestry, we must retrace our steps to the Mile End Road in order to see Bow Church, which lies in the main road a mile and a half eastward. We pass another group of old houses on the north side of the road, and then the People's Palace, noting that it displaced the Bancroft Hospital, founded in 1727 for the maintenance of twenty-four poor men and the education of 100 boys. A short tram ride brings us to Bow Church or Stratford-Bow Church, standing right in the centre of the road. Stratford Bow Church, as already mentioned, was built as a chapel-of-ease to Stepney, but after long rivalries and quarrels it was made a separate parish in 1719. The bells of the church were the famous ones mentioned in the nursery rhyme. The church is dedicated to St. Mary, and was built early in the fourteenth century; it consists of a chancel, nave and two aisles. There are one or two interesting monuments in the church and some old Flemish glass. There is nothing of special interest in the architecture. Opposite the church are some old houses, one of which still serves useful purpose as a club for young women. We must now retrace our steps for some distance westward until arriving at the Burdett Road, which takes us south to the next point of interest, Limehouse. The parish church is dedicated to St. Anne, and is one of the fifty brought

into existence by the Act of 1710. The architect was Nicholas Hawksmoor, the building being completed in 1724. The tower is a well-known landmark, and can be seen for many miles by those approaching London by the river. The interior of the church does not call for special mention; the whole building is treated in a plain, sensible style, but, excepting the tower, is not remarkable for grace or proportion.

This church is raised on a somewhat remarkable crypt, which is almost important enough in its nature to form a lower church. It contains vaults long sealed up, and it may be supposed that they were thus kept above ground to avoid difficulties with the adjacent river. Behind the church lies the old riverside highway called Three Colt Street, in which are some characteristic timber-fronted houses.

Below Limehouse lies the Isle of Dogs, or Stepney Marsh. It is supposed to have gained its former title from the dogs belonging to the Court of Greenwich being kept there. On the island there formerly stood an ancient chapel, dedicated to St. Mary, and supposed to be built for the convenience of mariners. It had been turned into a farm in 1800. It disappeared when the East and West India Docks were built. There is little to detain us in the adjoining parish of Poplar. The church was built as a chapel-of-ease in 1650 and rebuilt when the docks were made. An ancient hall standing in the High Street was pulled down in 1760.

Amongst several noted residents of the parish was Sir Richard Steel, who resided here some years. We now turn westward, and, skirting Limehouse Church and Basin, we take a turning to the left which brings us into the ancient riverside street of which the famous Ratcliffe Highway is a continuation. Here still remain some wooden houses of the well-known waterside type, as well as several good doorways and shop-fronts.

In a few minutes we have walked into Shadwell, whose name is a corruption of St. Chad's Well, formerly in the churchyard. The parish separated from Stepney in 1669. The previous church was burnt in 1821, when the present feeble edifice took its place. In 1749 the mineral springs were rediscovered, and an attempt made to establish a spa, which, however, soon died a natural death. The church is very appropriately, like many others hereabouts, dedicated to St. Paul. After passing Shadwell the street begins to widen, and we are soon aware that we are in St. George's Street, otherwise the "Highway." The district was known as Wapping Stepney, until St. George's parish was created in 1715. The church itself almost overshadows the Highway. It stands well in a good piece of ground, formerly a churchyard, but now converted into a recreation-ground. The tower is known to most of us, even to our Great Yarmouth friend, and so does not need much description. Those who have seen it have seen, perhaps, the best part of the church. Here, in the earliest days of religious revival, the infamous surplice riots took place. Within, the church is in its details expressive of the solemn respectability of fifty years since. The exalted place for the churchwardens, the crimson velvet cushions, comfortable pews, queer high pulpit with sounding-board, and, until lately, the charming old ladies with white caps who showed visitors to their seats, make a *tout ensemble* which in these advanced days seems quite archaic. A large proportion of the parish was pulled down in 1810, when the London Docks were made, and, as in parishes of similar nature, the better class folk have fled beyond the smoke to the suburbs.

Before leaving, notice the mosaics by Salviati, and the excellent decoration lately done under the superintendence of Mr. Keith Young. On the other side of the highway Old Gravel Lane runs down to the river. Near the lower end behind St. Peter's, London Docks, are the original buildings of the Raine's Schools. Henry Raine, a local brewer, here founded in 1719 a school for fifty boys and fifty girls. He also endowed a further scheme for educating a certain number of girls for domestic service. The scheme included the giving twice annually a wedding dowry of 100*l.*, drawn for by the girls. This interesting charity is still administered according to the original intention, but I regret to say that a new scheme is in process of being established, and in a few years the last dowry will have been paid. Hard by are Wapping Old Stairs, of classic memory, and also Execution Dock, of unenviable reputation. Here, according to Stowe, were hung in chains all pirates brought to London, and were not removed until three tides had flowed over them.

After glancing at Wapping Church, with its picturesque-looking tower, and noting several good doorways and shop-fronts, we return to the highway and turn westwards again. Princes Square is close by on the north side. In the centre is a curious little box of a place, the Swedish Church, built in 1729. Here was buried Swedenborg in 1772. A little further on is Wellclose Square, containing the Danish Church built by C. J. Cibber in 1696, at the expense of Christian II. of Denmark. It is now the British and Foreign Sailors' Mission Church, and contains an organ which is famous. Hard by are the St. Katherine's Docks, which preserve in their name the

memory of the splendid and famous buildings destroyed in their making in 1827. The charity was founded in 1148 by Matilda, wife of Stephen, as a hospital for the maintenance of a master and several poor brothers and sisters. It was dissolved and refounded on a similar but improved basis by Eleanor, widow of Henry III. During the Middle Ages the foundations were several times enriched by royal gifts. In the thieving days of the Reformation it managed, partly through royal protection and partly through the spirited opposition shown by the surrounding parishioners, to escape spoliation and dissolution. In the seventeenth century, however, many of the old buildings were destroyed by fire, and in 1825 the church was pulled down to make room for the docks.

At Regent's Park, whence the hospital was removed, there is a picture preserved, taken shortly before the church was demolished. Here are also carefully preserved many interesting relics. The old church seems to have consisted of nave, choir and aisles. In the chapel at Regent's Park may be seen the fine monument of John Holland, Duke of Exeter, his duchess and also his sister. He fought in the wars of Henry VI. and died in 1447. The detail is excellent and in fine preservation. The east window until lately was filled with old glass brought from the destroyed church, but the subjects were not considered appropriate for their position, and in 1887 the window was removed to make way for a modern one in commemoration of Her Majesty's Jubilee. At the west end of the chapel are some of the fourteenth-century stalls and a curious font. The pulpit is said to have been given to the hospital in the reign of James I. The organ also removed from the old church is noted for its fine quality and the possession of a remarkable swell. In the chapter-room are preserved some miserere seats, fine carvings from old choir-stalls, some charming old chairs, and a most interesting chandelier of fifteenth-century date.

From St. Katherine's Docks we reach the Minories, an historic street having its north end in Aldgate, where our journey ends. One cannot pass through this street without saying something about the abbey of St. Clare, although of this important Mediæval establishment only a small piece of wall remains. The nunnery of St. Clare was founded by Edmund, Earl of Lancaster, in 1293, to accommodate some nuns introduced from France by his wife Blanche, Queen of Navarre. The abbey became one of great importance during the Middle Ages, and continued until the Reformation, when it was dissolved. The abbey buildings then became the residence of many distinguished people. In 1552 Edward gave it to Henry, Duke of Suffolk, father of Lady Jane Grey, who was afterwards beheaded on Tower Hill. Holy Trinity Church, Minories, keeps in memory two great houses, for its name is derived from the famous monastery near here, whilst the wall forming the north side is the only fragment left of the nunnery of St. Clare. The church is much visited on account of its interesting associations. It was one of those which escaped the Great Fire, but it was partly rebuilt in 1706. The monuments and several of the fittings are preserved from the earlier church. Here is the tomb of Legge, the favourite servant of Charles I., and of his son, the first Earl of Dartmouth. One of the monuments is specially interesting as exhibiting the arms of the Washington family.

There is a pretty little Elizabethan monument under the west gallery, with a bread-shelf beneath whence loaves are distributed to the poor on St. Thomas's Day. The church itself is a queer little place, lighted with a dome in the centre. A gallery runs along the south side only, and there is a miniature choir and communion table. In the vestry there are several valuable prints of the last century showing the ruins of the demolished monastery buildings. The Plague records are also shown in beautiful handwriting. Here, too, is preserved in a glass box that ghastly relic, the head of the executed Duke of Suffolk, whose connection with this spot has already been mentioned. When sealing up the vaults many years since, this head was discovered caked in oak sawdust which had, by tanning the tissue, preserved it in the wonderful perfect state in which it was found.

Mr. ASHBEE, as a resident, alluded to the house he himself lived in, also to the palace at Bromley-by-Bow, one of the few remaining Elizabethan houses in London, now being destroyed under the superintendence of the Architect's Department of the London School Board, who had bought and jobbed away the fittings to a contractor, who sold all to a dealer for 150*l.*, the dealer immediately offering a single mantelpiece for 100*l.* Mr. Ashbee had succeeded, however, in preserving for South Kensington some of the finest of the ceilings.

Rev. J. K. MAHOMET, chaplain of London Hospital, said there was much good old work remaining if you could get hold of some fathers of the district to give information.

Mr. FELLOWES PRYNNE proposed a vote of thanks to Mr. Masey, which was seconded by Mr. W. E. Sedgwick and supported by Mr. Satchell.

The PRESIDENT referred to whole streets of Georgian buildings in Bermondsey and Southwark; also to the discovery of silver coins of King Edward in ballast dredged from the

Thames. He also said it seemed curious that so well-educated a body as the London School Board should not have known better than destroy the interesting fittings of Bromley Palace.

The vote was passed by acclamation, and the proceedings terminated.

ROBERT FOWLER, R.I.

IN South Castle Street, just at the zone of differentiation between the mercantile region dominated by "the Flags" and that which owns the sway of the docks, says the *Liverpool Daily Post*, is to be found one of the most interesting art studios in Liverpool, that of Mr. Robert Fowler. One enters beside a shop where flags of another sort exhibit a startling combination of colour, Japanese in its boldness, but innocent of the subtle harmonies of the East. The visitor who survives this strange blast of discordant colour is shortly refreshed by the delightful concords of a studio which has the stamp of the sensitive artist in every detail of its decoration. In it there has laboured, well-nigh lived, for a good many years an artist who amply merits that term in its wider sense, for Mr. Fowler's work as a painter is the expression of a mental activity which takes all art for its province. His easel is the centre of a little system of satellites of congenial tastes, to whom he is a powerfully inspiring force in their pursuit of painting, music and poetry. From time to time most of the younger art thinkers of Liverpool have yielded to the attraction, and few have left it to pursue the comet-like solitary course of the artistic life without carrying away illumination and mental force. The benefits have doubtless been reciprocal, and while he has been helping others to develop, Mr. Fowler has been broadening and deepening his own power as a painter. The working out of his destiny has been by no means simple, for his exceptional fertility of invention and his versatility of style have made the problem of what to do and how to do it an extremely difficult one. In subject and treatment there is scarcely anything that has not been tried, and at times Mr. Fowler's admirers have been inclined to shake their heads and dismiss him as a hopeless "Jack of all trades." The danger of such incorrigible versatility is great, and few there be who surmount the obstacles it creates; those who do, arrive at last at recognition as men of a higher order of thought than those who attain earlier to the simpler excellence of doing one or two things very well.

Mr. Fowler's imagination, after beating the air in all directions for his ideal with a passionate desperation equal to that of D'Albert, has found it at last in the art of Japan. This, which he probably caught from Mr. Woodlock, has been more and more apparent in his recent work, and the art of the pictures now on view in his studio holds in perfect solution some of the best elements of Japanese pictorial art. None the less is it a firmly articulated personal style; there is as a rule no blatant imitation of Eastern strangenesses—no crimson sky, distorted perspective or impossible proportion. The problems set to the curious by other Japanese devotees are not to be found on Mr. Fowler's canvases, in which no doubt is left as to which are the calves and which the children. The exquisite arabesque treatment of form and colour so as to make them intrinsically beautiful is the secret of the Japanese which he has pursued and overtaken; happily he has been content with the spirit, the essence, and has avoided mere imitation of manifestations which, natural in their native place, are in an English studio mere affectations. He has worked out for himself the axiom that "Nature is a purely anthropomorphic conception to be used by the artist with entire freedom," and in this connection styles himself an "optionalist."

In a period which prates idly of ridding art of "literary quality" Mr. Fowler remains a staunch adherent of the condemned school, but in such wise that its orthodox members would scarcely recognise his adhesion. He brings to his work a fancy stuffed with what is best in poetry, romance, legend, history, philosophy and music, and his pictures are filled with symbolical meaning and poetic suggestion. He is not neglectful of "the imaginative treatment of pigment," but uses it only as a means to the higher business of the imaginative treatment of imaginative conceptions. It would be difficult to trace and define the relationships of Mr. Fowler's art to that of other Europeans; he is as persistently symbolical as Mr. Burne-Jones, as persistently pagan as Albert Moore, but the resemblances to either are otherwise very remote, and they have grown fainter as his treatment has become increasingly vaporous, delusive and individual. His *Enchanted Glade* in the Grafton Gallery is a signal example of this latest manner, and the tender subtlety of *After Music*, now in the studio, still further illustrates it. The mysterious quality of the technique, the colour and tone arrived at one cannot exactly tell how, are perfectly in correspondence with the theme. *Eve and the Voices*, a picture which cannot fail to challenge attention to its beauty of design, peculiarly sweet colour and daring (if somewhat Walt Whitmanish) symbolism, is similarly elusive in technique; and so is a lovely landscape in which is realised that rarest of

successful achievements on canvas, a perfect sense of moonlight. It is almost startling to turn from this to another landscape in which cliff and sea in strong sunshine are presented with bold, almost insolent, breadth of brush-work. The never-failing sensibility to noble colour is the only characteristic the two have in common. The exasperating unlikeness of Mr. Fowler to himself in varying moods of inspiration makes him extremely difficult to classify, but it is due not to uncertainty of execution—for he does not seem able to lay on paint wrongly or in the wrong place—but rather to the altogether exceptional range of effort which proceeds from the restless activity of a nervous organisation controlled by a mind stored with an infinitely varied stock of well-digested knowledge. It doubtless retards fuller recognition, especially among brother artists, who are by training unfitted for large catholicity of judgment. Among very young students candid admiration and appreciation may be found, but the full-grown artist has formed his ideals and prejudices, outside of which he seldom recognises excellence. Virtuosity in the handling of paint is sure to appeal to him—a brilliant executant like Mr. Sargeant he can understand even if his own handling of pigment be deplorably niggling and laboured; but the soul of another man, unless it be after his own fashion, is incomprehensible. Imagination, second invention—these are to be suspected as heresies by all who lack them—and their name is legion.

Mr. Fowler has probably worked out his own individuality more completely by remaining in Liverpool, but it has also retarded his recognition, for provincial opinion looks to the Metropolis for guidance, and the Metropolis is slow to discover genius not affiliated to any of its log-rolling associations. Like the silversmiths' spoons, genius must be hall-marked in London before we dare accept it as unquestionably made of precious metal. Mr. Fowler, however, is not a member of the Royal Institute of Painters in Water-Colours; he has somehow made metropolitan criticism begin to be conscious of his doings, and his pictures are no longer strange apparitions at London exhibitions. At a coming exhibition in the Guildhall he is to be one of a hundred representative artists from the time of Reynolds until now. There is every reason to predict a considerable growth of his fame in the near future, and few painters of the day are so fully equipped in intelligence, enthusiasm and technical facility for the toilsome climb towards Fame's highest pinnacles.

THE OVERTURNING OF COLUMNS.

THE following interesting paper from the *Seismological Journal of Japan*, by Mr. F. Omori, of Rigakushi, reveals the power attained by the Japanese in dealing with constructional problems.—The engineering authorities of Japan have been long engaged in an endeavour to ascertain the best form of a wall or pier which, rather than snapping at its base, would, when subjected to horizontal reciprocating motion, be as likely to snap at any one horizontal section as at any other.

A brick building with walls approximating to this form has been designed and built by Professor K. Tatsuno on the University compound. Mr. C. A. W. Pownall, M.I.C.E., has constructed brick piers for the bridges on the Usui Pass, some of which are 110 feet high with similar sections. The piers follow a parabolic contour from the foundations to the springing of the arches. An experiment relating to overturning which is in progress is to determine the relationship between the dimensions of a body and the amplitude of motion which will fail to overturn the same, no matter how short the period of motion may be. Mr. Omori's essay is a contribution to the subject. He has also accomplished another serviceable piece of work. Many earthquakes seem to be the result of sudden fractures or yieldings taking place during the process of rock-crumpling: it does not seem unlikely that the relief of strain along one axis should be altogether without effect upon neighbouring axes where folding may also be in operation. Mr. F. Omori has plotted the shocks which succeeded the great disturbance of 1891 as a curve, the co-ordinates of which are equal intervals of time and the number of shocks occurring during these intervals. The immediate cause of the disturbance was the formation of a large fault which can be traced some forty or fifty miles, together with several minor faults. During the seven months which followed the great shock no less than 3,000 shocks were recorded. How many have been recorded up to date has not been calculated.

The curve representing this decrease in activity closely approximates to a rectangular hyperbola, which now, with an average of two shocks per day, is becoming asymptotic.

With the law of decrease deduced from these records, Mr. Omori calculates that it will take about thirty years for the district to regain its original stability.

The acceleration formula of Professor C. D. West $f = \frac{x}{y} g$, where y is the height of the centre of gravity of the column and x half the basal dimension, seems, as tested in experiments

with columns of moderate dimensions, such as tomb-stones, to give practically satisfactory results. Its applicability, however, ceases when the amplitude of motion becomes very small. A motion whose range is very small, even though the maximum acceleration be very great, would never be able to overturn large columns. For instance, if $\text{ampl.} = 1 \text{ mm.}$, $\text{period} = 0.1 \text{ sec.}$, then the maximum acceleration is 3,950 mm. per sec. per sec. But this motion, as may be easily tested, cannot overturn a column whose dimensions are, say 2 inches in base and 8 inches in height. That amplitude plays a very important part in the overturning of columns may be seen from the following considerations.

We shall distinguish two cases of motion, in one of which the period is very short, and in the other where it is comparatively long.

First Case.—When the period is very short, the column would be overturned towards the direction from which the impulse comes. Since the period is very short, the column will behave as if a sudden blow or displacement were applied to its base, *i.e.* will tend to rotate about its centre of percussion with respect to the edge about which the column will actually turn. The height of the centre of percussion P , for a column of rectangular section whose height is $2y$, and whose breadth is $2x$, is

$$\frac{4}{3} \frac{(x^2 + y^2)}{y}, \text{ or } \frac{4}{3} \frac{(x^2 + y^2)}{3y}.$$

The column will be overturned when the rotation of it is so great as to bring the centre of gravity G vertically over the edge A —that is, when

$$\frac{2a}{OP} = \frac{OA}{OG} \text{ approximately,}$$

$2a$ being the range of motion or displacement communicated to the edge A ; or

$$(1) \dots \dots 2a = \frac{OA}{OG} \cdot OP = \frac{x}{y} \cdot \frac{4}{3} \frac{(x^2 + y^2)}{3y} = \frac{4x}{3y} \frac{(x^2 + y^2)}{3y}.$$

This equation will give the lowest limit of the range of motion, when the period is very short, necessary for overturning a rectangular column of height $2y$ and of breadth $2x$. We here give a few applications:—

	$2x$	$2y$	$2a$
(1).....	(a) 1 in.	4 in.	0.71 in.
	(b) 2	8	1.4
	(c) 3	12	2.1
(2).....	(d) 6	24	4.3
	(e) 12	48	8.5
	&c.	&c.	&c.

From equation (1), the range of motion $2a$, is seen, for columns whose height and breadth have a constant ratio, to be proportional to these dimensions. Columns with the same ratio of height and basal dimensions as in the above group (2), and of the absolute dimensions between (d) and (e), would represent the case at Nagoya on the occasion of the great earthquake. The range of motion at that city might have been not very much different from 8 inches.

As equation (1) shows, the range of motion necessary for overturning a column increases in proportion to its dimensions. This seems, judging from experiments tried with small columns, to be extremely probable. If the basal dimension of a column be 20 feet and its height 100 feet, equation (1) will give $2a = 14$ feet. This may, in a measure, explain why the five-storeyed pagodas have not yet been overthrown even in such severe shocks as the Yedo earthquake of Ansei second year (1854) or the recent Gifu-Nagoya earthquake. Again, we know that the upper broken portions of brick chimneys are often rotated, but not thrown down. Such may partly be due to the range of motion not being sufficiently great.

Second Case.—Let the period of motion be comparatively long, say one or two seconds. Then, supposing the motion to be simple harmonic, the column, when of proper dimensions, would not be overthrown at the start (as in the preceding case), but will move together with the ground and acquire its velocity. When the ground particles reach one extremity of motion, and its velocity becomes zero, the column would still retain its acquired velocity and be overturned in the forward direction as the ground begins to move backwards. This is precisely what takes place in actual trials. Under this supposition, the behaviour of the column at the instant of overturning will be the same as when a certain velocity is suddenly communicated to the body.

If $2y$, $2x$ be respectively the height and breadth of a column, then the velocity, which, when suddenly communicated

to the column, is just able to overturn it, that is to rotate the column so far as to bring the centre of gravity just vertically over the edge about which it turns, is

$$(3) \dots V = \sqrt{\frac{8g \sqrt{x^2 + y^2} (1 - \cos \phi)}{3 \cos^2 \phi}}; \text{ or } \sqrt{\frac{8g y (1 - \cos \phi)}{3 \cos^3 \phi}}$$

ϕ being the angle between the diagonal and a vertical side of the column. The following are a few illustrations.

$2x$	$2y$	V	$2a$
1 in.	4 in.	8.2 in. per sec.	2.6 in.
2	8	11.6 per sec.	3.7
3	12	14.2 per sec.	4.5
6	14	20.1 per sec.	6.4
12	48	28.4 per sec.	9.0
&c.	&c.		

The values of V for columns having the same ϕ varying as the square root of y or x .

Now V may be looked upon as being equivalent to the maximum velocity of the particle in its simple harmonic motion, namely—

$$V = \frac{2\pi a}{T}$$

Hence, if we know the period of motion, we can approximately determine the range of motion. The figures in the last column of the above table have been calculated from this formula, $2a$ varying as V . The period of motion at Nagoya was probably not far different from one second. The estimated range of motion for Nagoya is thus seen to be nearly the same, whether we suppose the motion to be very short in period or, what is more likely, to be comparatively long.

In my own belief, the "accelerations" of the motion of ground as determined from the observations of overturned columns seem to be practically correct, and the results of the calculations here indicated are only to be looked upon as checks.

WILLERSLEY CASTLE.

ONE of Carlyle's pets was Richard Arkwright, who is described as "no romance hero with haughty eyes, Apollo lip and gesture like the herald Mercury; a plain, almost gross, bag-cheeked, pot-bellied Lancashire man, with an air of painful reflection, yet also of copious free digestion—a man stationed by the community to shave certain dusty beards in the northern parts of England at a halfpenny each. Oh, reader, what a historical phenomenon is that bag-cheeked, pot-bellied, much enduring, much inventing barber! French Revolutions were a-brewing; to resist the same in any measure, imperial Kaisers were impotent without the cotton and cloth of England; and it was this man that had to give England the power of cotton."

About 1771 Arkwright set up his first cotton mill in Matlock Dale; and there he laid the foundations of his immense fortune. In 1782 he was able to purchase the Manor of Willersley, or Willersley, which was one of the largest estates in England. He erected a mansion from the designs of William Thomas. During the progress of the works a set of verses appeared, addressed to the architect. It is rarely a compliment of that sort is offered, and accordingly the lines merit to be recorded for their subject if not for their style:—

These new form'd towers in prospect as I view,
With mind intent, their progress I pursue,
Which well our fixed attention may command,
Displaying on each stage a master's hand,
Disposed to captivate the gazer's sight
As ancient grace with modern strength unite,
Where uniformity its charms displays
To bend each arch, each swelling column raise,
While relative proportion rules the whole,
Of every part the animating soul:
As the vast pile still growing on our eyes,
Shall still, with happy auspices arise,
Such, Architecture, are thy traits confessed,
From times remote, in various modes expressed,
That art renown'd which elder ages taught,
And Rome succeeding, to perfection brought,
Ere Europe's modern sons put in their claim,
In later ages emulous of fame.
Hail, Art sublime! preserv'd with constant care,
Offspring of Symmetry and Order fair,
O may we see thy votaries increase,
And mark thy beauties in the days of Peace.
And thou whose useful talents here are shown,
Thy skill by many a pleasing structure known,
Well do thy precepts and designs impart,
The elements of thy beloved art;

Nor thus content, yet emulous, we find
Thy fair example leave those rules behind.
Thomas, proceed, thy powers at full display
Where genius kindly points the destined way;
Boldly advance; the path before thee lies,
By genuine merit to fair fame to rise;
While still thy fix'd attention to engage,
For thee fair Science ope's her ample page.
Form'd, as thou wast, beneath the fostering care
Of those whose fame their various works declare,
What mayst thou not attempt, as mellowing time
Shall raise thy genius and thy powers sublime,
Call forth thy vigour, bid thy views extend,
The fair and useful in each work to blend.
Meanwhile this varied scene enchants our eyes,
Where Art and Nature's choicest beauties rise.
By taste united, which can best combine
The fair ideas of each just design,
Such as with proper elegance displays
The edifice that speaks the artist's praise.

GENERAL.

The Clayton Loan Collection at Bank Field Museum has been valued for the executors, and will be offered to the library committee of the Halifax Town Council for purchase.

The Parish Church of Grinton is to be restored, the estimated cost being 2,000*l*.

A Memorial Tablet, designed by Messrs. M'Gibbon & Ross, has been set up in the new chapel of St. Giles's Cathedral, Edinburgh. It bears the following inscription:—"This chapel was erected to the memory of William Chambers, of Glenormiston, LL.D., publisher, Lord Provost of Edinburgh, 1865-69, to whose munificence Scotland is indebted for the complete restoration of the ancient cathedral, 1883."

Sir George Reid has been re-elected president of the Scottish Artists' Benevolent Association. The capital funds now amount to 3,396*l*.

A Technical School is to be erected in Richmond Terrace, Brighton, which will contain laboratories, lecture-theatres, research-rooms, lavatory and various classrooms. The estimated cost is only 13,000*l*.

Mr. A. C. Morton is endeavouring to persuade the Government to expend 100,000*l* in putting Holyrood and Linlithgow Palaces into a proper state of repair. He proposes that 10,000*l* a year should be employed for ten years.

An Amended Design for the Bath Pump Room annexe is to be prepared by Mr. Brydon, in order to obtain a less costly building.

The Glasgow School Board have acquired 6,000 yards of land in Dennistoun as sites for two schools.

The Court of Chancery has granted the sale of a site for the proposed Mathew Park church. The vicar of West Ham (the Rev. Arnold Pelly) undertakes the whole responsibility of erecting the building.

Naval Barracks for 3,500 officers and men are to be erected at Chatham. When this building is completed the hulks which now occupy valuable space in the basins will be removed. The barracks at Walmer are also to be extended.

The Case of Drew, Bear & Co. v. Edwardes, which relates to a contract for the ironwork at Daly's Theatre, has been sent by the Queen's Bench Division before one of the official referees.

The Master Builders' Association will meet in July at Bolton.

The Annual Report of the Surrey Archaeological Society states that the number of members was 315, viz. 218 annual, 95 life and 2 honorary. During the year thirteen new members (twelve annual and one life) had been elected, and by death they had lost nine members. There was a small deficit on the year's expenditure, and this was accounted for by the funding of several life subscriptions formerly treated as current account. The reserve fund consisted of 389*l*. 16*s*. 3*d*. in 2*1*/₄ per cent. Consols, and a sum of 25*l*. on deposit, pending investment.

The Workmen employed on the interior renovation of Poughill Church, Bude, have discovered some excellent traces of fresco-paintings worked upon a coat of plaster on the walls of the north and south aisles. The fresco in the north aisle measures about 12 feet by 9, and is undoubtedly a work of a very early part of the sixteenth century. It is a representation of St. Olaf, who is the patron saint of the church. The fresco in the south aisle measures 11 feet by 8, and has St. Christopher for a subject.

Inber Court, Thames Ditton, which will shortly be offered for sale, was originally designed by Inigo Jones. The wings were added at the close of the last century.

The Admiralty Buildings are expected to be ready for occupation in the course of the present year.

The Architect.

THE WEEK.

It is not often so slight a cause as occurred at the Birmingham Assizes on Tuesday is considered sufficient to postpone the hearing of a case indefinitely. The plaintiff sought to restrain the Aston Local Board from pulling down a house which was built, it was alleged, without conforming to the by-laws. The dispute really turned on the signification to be given to the phrase "south side." The plaintiff was authorised "to erect dwelling-houses on arches or girders with pillars over the main sewer on the south side of Holte Road, Aston." The question to be decided was whether the phrase meant the south side of a particular sewer or was intended to distinguish between a sewer on the south side of the road and one in the centre. The latter suggestion was the plaintiff's, but as it was not recorded on the pleadings it was necessary to have the trial adjourned to London in order that the documents might be amended. The costs for the day fell on the plaintiff.

A CASE for the recovery of architects' fees, amounting to 492*l.* 19*s.*, was heard before Mr. Baron POLLOCK in Birmingham on Tuesday, and was decided against the plaintiffs. In fact, the defendant's case was not presented. It appears that on October 13 Mr. CHARLES MAJILTON, a theatrical manager, with the late Mr. APPLEBY, called on Mr. RADCLIFFE, of the firm of RADCLIFFE & WATSON, and said he wished to have plans prepared for a theatre at Aston, which was to have a pit capable of containing a thousand people, besides three or four shops in front. The sum mentioned as the proposed outlay was 5,000*l.* or 6,000*l.* A few days afterwards Mr. APPLEBY, to whom the arrangements were confided, called, and was shown a plan with pit accommodation for 600, but he would not approve of it; nothing less than a pit for 1,000 would answer. Mr. RADCLIFFE said the cost would have to be increased, but he was told they were not particular to a thousand or so. On November 10 Mr. MAJILTON arrived with his manager, and suggested the addition of a fourpenny gallery. Afterwards the scheme was abandoned, and 2 per cent. on the estimated cost was claimed. In cross-examination Mr. RADCLIFFE admitted that his partner wrote to him, "There is no doubt about it, it will come to quite double; and I think you ought to have stated it could not be done for the figure. I hope you stated that in your letters to MAJILTON. He may repudiate the whole thing as soon as he knows what the estimates are." Naturally, defendant's counsel took advantage of the confidential communication, and said it represented their case. Baron POLLOCK said he could not see how the claim could be enforced. An architect could not so far deviate from his original instructions without the absolute sanction of his principal, before whom the additional expense should be clearly put. It was, no doubt, hard upon the plaintiffs in one way. They had done some work according to defendant's instructions, but the scheme grew larger, and they no doubt sunk that work in the preparation of more comprehensive plans, which, if carried out, would have increased their remuneration. That the defendant declined to accept, as not according to his instructions. Judgment was therefore given for the defendant. The result is unsatisfactory, not only for the loss suffered by plaintiffs but as a further illustration of the consequences which are sure to arise when architects, as too commonly happens, prefer to trust to chance instead of having a definite understanding with their clients. It cannot be too often reiterated that before the law architects are simply agents for their clients, and they have no more right to arrange for a building to cost double the sum prescribed than any ordinary mercantile agent would have if he ordered goods to the extent of 1,000*l.*, when according to his instructions he was not to exceed 500*l.* An architect may consider that, as an artist, his fancy is not to be thwarted when he is eager to produce a masterpiece, but any one who takes that view should inform his client beforehand.

It is necessary for the survival of South Kensington that an immense number of students should be returned as "passing" the examinations. "Results" are therefore sought after that will be deemed satisfactory by officials, not the advantage of the students. The examination papers, which are supposed to be tests, may appear difficult to the uninitiated, but when it is known that they cannot differ much from papers which are printed and circulated by the Department, the difficulty is more apparent than real. To make the examinations still more easy, answers as well as questions are to be made available. A sample volume relating to building ("Building Construction: Key to Examinations of Science and Art Department," by HENRY ADAMS, M.Inst.C.E., &c. CHAPMAN & HALL, Limited) has been sent to us. According to the author, "every question given in the examination papers of both the elementary and advanced stages during the last thirteen years is here stated with its diagram exactly as given, and the solution of each has been carefully worked out and reduced for printing to about one-half, so that candidates may know precisely what is usually asked for and how they are expected to work their answers."

If the style of answering were alone to be suggested, it would not be necessary to give so large a number of reprints. Students will look on the book as a sort of store containing all the answers they are likely to need for the winning of prizes and honours. As there are three hundred and thirty-eight problems, examiners can hardly think on a subject that is not illustrated. Mr. ADAMS, it must be allowed, has done his model answering creditably, and he must be a dunce who cannot cram himself with the help of the book so as to satisfy the kindly band of examiners. We may expect that the usual complaints about the strange replies will be omitted from annual reports for the future. They were becoming monotonous. Technical education will appear to have received a fresh impetus, but after glancing at Mr. ADAMS'S "Key" we are afraid architects and builders will not appreciate the distinguished students of the Department's classes of construction.

At the annual meeting of the proprietors of the Manchester Royal Exchange the chairman, Mr. D. MATHESON, explained the expenditure of 5,613*l.* on account of alterations. They comprised the erection of two galleries and the entire reconstruction of the smaller domes, which were now completed. The additional light obtained from the domes was an inestimable advantage to members of the Exchange, and the alteration had given general satisfaction. Ventilating fans had also been provided for the domes and lavatory, which would greatly improve the sanitary condition of the building. An important work undertaken by the directors during the past year was the lighting of the Exchange with electricity. Although the contracts for the installation exceeded 1,200*l.*, the directors felt that so important an improvement could not have been wisely postponed. The expense of maintenance would necessarily be more than the cost of gas, and if the present high rate of charge for electricity was maintained by the Corporation the directors might find it an advantage at a later stage to put in the plant requisite to provide electricity for their own requirements. The directors had also been compelled to undertake the repair and improvement of the whole system of drainage of the Exchange, and of the shops and cellars which formed part of the building. The work was now in progress under the direction of the architect, Mr. MURGAT-ROYD.

SPORT is so attractive, the exhibition of drawings of the "big game" of America which is now open at the Burlington Gallery should be a success. There is much which is excellent among them. To many visitors the series of drawings by the late Mr. WASHINGTON FRIEND will be no less interesting. He had the good fortune to visit America before it was transformed, and his records of the primæval forests and other scenes are not only picturesque but novel. Spots which are now occupied by bustling towns were seen by Mr. FRIEND in a condition of quietude that has passed away. The QUEEN and several members of the Royal Family have shown their appreciation of Mr. FRIEND'S work by purchasing examples.

COLERIDGE ON ART.

WE are told by DE QUINCEY of a description which COLERIDGE gave him of a set of plates known as PIRANESI's "Dreams," and etched during a fever. They represented a series of vast Gothic halls. The artist was perceived groping his way up one of the staircases, which ended in a landing that was without balustrading or other protection, and his destruction appeared to be inevitable. However, a second flight was seen above similarly arranged, and PIRANESI was standing on the brink of the abyss. Successions of stairs followed, which the doomed man was compelled to ascend without the hope that his weariness would finally come to an end in rest. A metaphysician, and especially one like COLERIDGE, could not help being impressed by an invention of that kind, nor was he ever likely to forget it. The interminable process of ascending through colossal vaults to an unknown and incomprehensible region would recall speculations about time and space and other subjects where no goal is to be reached. The plates would also fascinate COLERIDGE on account of their architectural character. Although he could be described as being compact of imagination alone, and out of place in a material world, COLERIDGE appreciated the work of Mediæval builders at a higher value than most of his contemporaries. A man who was so unworldly did not possess the knack of compelling men to agree with him, and accordingly his influence on the revival of Gothic was infinitesimal if compared with WALTER SCOTT'S. But neither in verse nor prose has SCOTT revealed such intensity of feeling before Gothic masonry as we find in occasional remarks by COLERIDGE.

SCOTT, however, possessed one advantage over COLERIDGE. When he admired a mountain or a mullion he could express his thoughts frankly without any fear that he would be considered a simpleton. His readers, like himself, believed he had revealed the whole mystery of Mediæval architecture when he wrote:—

Thou wouldst have thought some fairy's hand
'Twixt poplars straight, the osier wand,
In many a freakish knot had twined;
Then framed a spell, when the work was done,
And changed the willow wreaths to stone.

SCOTT was so honest a man he would not take the whole credit for a theory so ingenious, which made the architect draw inspiration from the basket-maker, and he acknowledged his indebtedness to an essay by Sir JAMES HALL in the "Edinburgh Philosophical Transactions." Poor COLERIDGE could not be satisfied with that sort of admiration. He believed in spontaneity for the finest efforts of mental action, admiration being among them; but he felt compelled to restrain himself until he was satisfied why he should admire a work of art, and whether the artist had adopted the right course to insure admiration. It was this characteristic which CARLYLE described with grim humour as the accumulation of formidable apparatus, logical swim-bladders, transcendental life-preservers, and other precautionary and vehiculatory gear for setting out, and which were more likely to make COLERIDGE deviate from his course into infinitude or nowhere than to help him to arrive at any definite end.

COLERIDGE could well ask what is the use of devising a philosophical system, as I have done, unless it can be applied in answering questions about art as well as more abstruse things? There is no doubt he possessed a system, and was always joyful to exhibit its applicability, but it was, like the bow of ULYSSES or the papers which are so constantly lost in London, of no use to anybody but the owner. "My system," COLERIDGE said on one occasion, "is the only attempt ever made to reduce all knowledges into harmony," and he looked forward to the time when it was to be accepted as a sort of sun enlightening the various philosophical planets. At another time he said the object of it was to make the senses out of the mind, not the mind out of the senses, as had been done before.

COLERIDGE may have had the vision of PIRANESI in his mind, for he somehow shirked obedience to the impelling force, and in expounding his system he did not ascend very far. He was always promising himself a time when he would set about the task and realise his aspirations to be a law-giver or light-bringer from above, but the ascent

scared him. Men whose business it is to explain systems find it is toilsome work to explain them when there are ample expositions, and they cannot be expected to take the will for the deed in cases which have not got beyond the embryo condition. Consequently, COLERIDGE's name is dropped in treatises on psychology and histories of philosophy. It is possible, however, to have a glimpse of principles which will help us to understand his views about art.

In the first place, COLERIDGE insisted on the existence of a principle or law which was to serve as a guide in all operations. It was to be "a truth in the mind itself pregnant with the consequences of other truths in an indefinite progression." The pure sciences afforded examples. No less important was theory, "in which the existing forms and qualities of objects, discovered by observation, suggest a given arrangement of them to the mind, not merely for the purposes of more easy remembrance and communication, but for those of understanding, and sometimes of controlling them." The scientific arts or sciences exhibited relations of theory. Between the two "lies the method of the fine arts; a method in which certain great truths, composing what are usually called the laws of taste, necessarily predominate, but in which there are also other laws, dependent on the external objects of sight and sound which those arts embrace." The well-known remark by COLERIDGE about painting being the intermediate somewhat between a thought and a thing has been commonly taken to be only a witticism: it really corresponds with the division which he laid down and which we have just given. We are told that in a picture gallery he would say, after looking at a work of one class, "There's no use in stopping at this, for I see the painter had no idea; it is mere mechanical drawing," while before others he would exclaim, "Here the artist meant something for the mind."

It is not easy to discover whether the idea was to be something that could always be treated as of one class. That word has been the cause of countless errors, or at least has given rise to countless controversies, and COLERIDGE is not more precise on its use than the majority of philosophers. He tells us the idea may exist in a definite form, like the circle in the mind of a geometrician, or "it may be a mere instinct, a vague appetency towards something which the mind incessantly hunts for but cannot find, like a name which has escaped our recollection, or the impulse which fills the young poet's eyes with tears, he knows not why." Now in art COLERIDGE appears to have the fullest faith in the old Italian principle of multitude in unity, *il più nell' uno*. Of course he recognised that there must be subordination, but his objections against certain works of art generally arise from a belief that the artists, in determining degrees, were not always just or faithful to principles, and preferred to please themselves. Thus we find him remarking on CLAUDE'S system of giving so much prominence to the atmosphere as to make it substantial as the rest of the scene. Hence some of his sunsets produced a close and suffocating effect on COLERIDGE. The earthly character of RUBENS'S genius seemed to him in its right place when inspiring a *Triumph of Silenus*, which was unmitigated animalism. For the same reason he admired RUBENS'S landscapes as being in keeping with common objects. But RUBENS as a painter of gods and goddesses, nymphs or heroes, was out of his element, and degraded the subjects instead of exalting them. "Believe me," he said in one of his early lectures, "you must master the essence, the *natura naturans*, which presupposes a bond between nature in the higher sense and the soul of man." But that was not to be attained by fixing on a particular form for constant imitation, like CIPRIANI and others, who were esteemed as realists. JOHN MARTIN'S designs he condemned because of the evident dissatisfaction of the painter with everything that was not prodigious. COLERIDGE does not appear to have remembered how much importance is attached to the characteristic in art, or how often it is connected with defects. There never was a painter of any account without mannerisms which are generally departures from ideal excellence, although admirers have a weakness for them. The same phenomenon is witnessed in literature. The mannerism may have as little to recommend it as that peculiarity of sound which arises when materials assert themselves in musical instruments, but in a world where so

much is fallible neither painting nor music can be expected to attain perfection.

The respect for law and theory which COLERIDGE advocated, because without it chaos would come again, made him an admirer of the established rules which used to be employed in the planning of pictures. They became for him illustrations of the *thesis* and *antithesis*, which he held to be conflicting life principles that are essential for all things. Let the figures of a painting be arranged within geometrical figures such as a triangle or a circle, but if care is taken to avoid stiffness of grouping by variety of life, motion and passion, then the feelings as well as the judgment or perception will be gratified. He cites as an example RAPHAEL'S *Galatea*, of which we gave a print a fortnight ago. As the majority of our readers must have observed, the line of limitation in that work is not the triangle but the circle. COLERIDGE had evident delight in pointing out the plan in the essays he wrote for a Bristol paper in 1814, as will be seen from the following:—

In Raphael's admirable *Galatea* the circle is perceived at first sight, but with what multiplicity of rays and chords within the area of the circular group, with what elevations and depressions of the circumference, with what an endless variety and sportive wildness in the component figures and in the functions of the figures, is the balance, the perfect reconciliation effected between these two conflicting principles of the free life and of the confining form. How entirely is the stiffness that would have resulted from the obvious regularity of the latter fused and (if I may hazard so bold a metaphor) almost volatilised by the interpenetration and electrical flashes of the former. But I shall recur to this consummate work for more specific illustrations hereafter.

Unfortunately COLERIDGE did not keep his promise in respect to the *Galatea* more faithfully than in other important cases. We can see from his criticism that in spite of his scanty acquaintance with the operations of painting he surpassed most amateurs in his enjoyment of a fine picture. It therefore seemed to him to be remarkable that MILTON, who was one of his idols, while displaying a love of music, so often avoids noticing the great painters of Italy, whose works he must have seen, and does not appear to recognise painting as an art. COLERIDGE held that poetry appealed to us under three forms, viz. as poetry of language, poetry of the ear or music, and poetry of the eye, comprising plastic or sculpture, and graphic or painting, while having a common essence. It seemed to him that MILTON and all poets were bound to have a similar theory.

He took care, however, that MILTON should be on his side when treating of architecture, for he wrote an imaginary dialogue which was supposed to have been held between the great poet and a puritan in front of the cathedral of York, which was one of the buildings most admired by COLERIDGE. To all the objections raised by the puritan about the absence of the beauty of holiness from the cathedral, the toil that the erection imposed on thousands of poor creatures, the pride of the clergy, and so on, MILTON simply replies, "It is very beautiful," and afterwards he expressed another of COLERIDGE'S doctrines about art:—

I did not call it good, nor have I told thee, brother, that if this were levelled with the ground, and existed only in the works of the modeller or engraver, that I should desire to reconstruct it. The GOOD consists in the congruity of a thing with the laws of the reason and the nature of the will, and in its fitness to determine the latter to actualise the former, and it is always discursive. The Beautiful arises from the perceived harmony of an object, whether sight or sound, with the inborn and constitutive rules of the judgment and imagination, and it is always intuitive. As light to the eye, even such is beauty to the mind, which cannot but have complacency in whatever is perceived as prefigured to its living faculties. Hence the Greeks called a beautiful object *kalon*, quasi *kaloun*, i.e. calling on the soul, which receives instantly and welcomes it as something connatural.

To COLERIDGE architecture appeared as exhibiting the greatest extent of the difference from nature which may exist in works of art. It involved, he said, all the powers of design and is sculpture and painting inclusively; it showed the greatness of man and should at the same time teach him humility. COLERIDGE was enabled to travel and he gazed upon many of the Classic churches abroad as well as on Mediæval buildings in England. The effect of the two varieties of buildings on his mind is best described in his own words:—

When I enter a Greek church my eye is charmed and my mind elated; I feel exalted and proud that I am a man. But the Gothic

art is sublime. On entering a cathedral I am filled with devotion and with awe; I am lost to the actualities that surround me, and my whole being expands into the infinite; earth and air, nature and art, all swell up into eternity, and the only sensible impression left "that I am nothing."

COLERIDGE was not the man to be satisfied with saying he was affected until he became humble in spirit by an architectural work. He would understand how thesis and antithesis, mesothesis, prothesis and synthesis operated in producing that result. He found diversity developing into unity in two different ways, for Classic details are very different to Gothic in expression and effect on the mind. His endeavour to explain his states of mind before two varieties of architectural art is one of the most interesting to be found:—

In the Pantheon the whole is perceived in a perceived harmony with the parts which compose it, and generally you will remember that where the parts preserve any distinct individuality, there simple beauty or beauty simply arises; but where the parts melt undistinguished into the whole, there majestic beauty or majesty is the result. In York Minster the parts, the grotesques, are in themselves very sharply distinct and separate, and this distinction and separation of the parts is counterbalanced only by the multitude and variety of those parts by which the attention is bewildered; whilst the whole, or that there is a whole produced, is altogether a feeling in which the several thousand distinct impressions lose themselves as in a universal solvent. Hence in a Gothic cathedral, as in a prospect from a mountain's top, there is indeed a unity, an awful oneness, but it is because all distinction evades the eye. And just such is the distinction between the "Antigone" of Sophocles and the "Hamlet" of Shakespeare.

After reading the foregoing extract, it seems probable that, in spite of his efforts to be impartial, COLERIDGE'S bent was towards Gothic, which he believed was a sublimer effort of genius than the Greek style. We imagine that to his mind it required far greater power to produce unity of effect with the variety of sculptured details that are necessary in a Mediæval church than with the fewer and simpler parts of a Greek building. That view would also explain his preference for King's College Chapel in Cambridge. The intricate vaulting would be likely to appear incomprehensible to COLERIDGE when it was scrutinised, and yet the general effect was one of extreme unity.

It was unity of effect which he considered was the indispensable requisite of sculpture as of architecture. COLERIDGE was something of a Gothicismist in that art also, for he was apprehensive that imitation of the antique would keep the attention fixed on externals rather than on the thought within, would induce efforts to combine incongruous things, such as modern feelings in antique forms, and because antique sculpture was like a dead language, and could not be impressive except to a few. At a time when Classic robes were supposed to be indispensable for statues of Englishmen, he maintained that "a skilful adoption of modern habiliments would in many instances give a variety and force of effect which a bigoted adherence to Greek or Roman costume precludes."

Much more might be said on the subject, but we hope we have given evidence enough of COLERIDGE'S discernment at a time when art was neglected, when, as he said in sorrow, "the darkest despotisms on the Continent have done more for the growth and elevation of the fine arts than the English Government." Happily, we live in days that are more favourable, and some of the credit for the change should be credited to SAMUEL TAYLOR COLERIDGE.

THE SYDNEY NATIONAL GALLERY.

THE popularity of the National Art Gallery in Sydney is increasing. This fine collection was first instituted in 1871 in connection with the New South Wales Academy of Art. It was reopened as the National Art Gallery in 1880, and is now situated in one of the public reserves of the city, known as the "Outer Domain," in a convenient and well-lighted building, at present unfinished as regards the exterior, although steps are contemplated to complete the structure. The Gallery contains an excellent collection of paintings and statuary, comprising some of the most famous works of the best modern artists of the old world, and includes several very valuable gifts from private persons. Like the other national institutions of New South Wales, the Gallery is open on Sundays as well as week-days, and on the former and on public holidays the attendance is especially numerous. During 1892 it was visited by 250,109 persons, the Sunday attendances being 101,683, and those on week-days 148,426.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

JOHN NASH AND HIS CONTEMPORARIES.

IT has been the lot of John Nash to obtain a larger measure of repute than abler architects. Few Englishmen since Wren's time were permitted to display their powers on so immense a scale, and it is inevitable that while some consider he was successful, many others point to him as a failure. There is little doubt his transformation of a part of the Metropolis was, after the performance, accepted as one of those bold strokes which are accomplished only by artists of extraordinary genius. There is so much that is laudatory of Nash in the publications of the early part of the century that the following "Letter to John Nash, Esq., on the architectural improvements now making under his direction, between Carlton House and the Regent's Park, by an Architect," has the interest of being almost unique, and we reprint it as a curiosity.

Sir,—As an humble professor of that art in which you have such extensive practice and influence, I take leave to address a few observations to you, dictated by no sense of disrespect, but by a high feeling of the importance of a pure taste to the fame of our country; which feeling is of the more consequence in our noble art than in either of her more delicate sisters, as being more lasting and perpetuating the fame or disgrace of a good or bad taste in a greater degree.

Your official situation, sir, renders you a leader in art, and, as the successor of Wren, Chambers and Wyatt, the quantity and publicity of your works must have a great and lasting influence on the taste and character of high art, particularly in architecture; for if the fountain head is pure, so will be the lesser streams. The Parthenon and the Poikile, the Temple of Theseus and the Erechtheum, produced the sculptures of the one and the pictures of the other in the self-same style, and "produced fruit after their kind;" for the pure, the divine taste of the architect refined that of the painter and of the sculptor.

Shall we expect such fruit from the style you are so unhappily reviving? a style which all the best critics thought and fondly hoped, and which, but for you, would have been consigned to the tomb of all the Capulets. It matters not to me, sir, whether the details of your works are bad from choice or carelessness; for the whole, as wholes, are in general admirable, the character of your designs being like those of Vanbrugh, more painter-like and picturesque than most of your contemporaries; but alas! sir, the detail, the parts, the alphabet, the orthography of our art in your hands is defective, is graceless, and, like Vanbrugh's, is cumbrous and inelegant; as unproductive of its intentions as if the poetry of a Byron or a Southey were sent out into the world with (if it were possible) defective grammar and bad orthography.

Little, sir, was it expected after the introduction of the fine forms and pure proportions of Greece, by Stuart, Revett, Pars, Wilkins and others, who have revelled in the pure streams of Attic elegance, that Batty Langley and Payne would at this time, aided by the powerful talents of a Nash, have substituted the sophisticated spoliations of Roman barbarism for Grecian splendour and purity.

It is of little consequence, sir, as I have before said, whether these defects are the results of choice or indifference. An able defender of yours attributes them to the latter, and says that while you compose a grand whole, you care not what master's proportions you adopt. "A Doric is a Doric," says this critic, and an Ionic an Ionic, whether Greek or Roman, and the gentlemen who employ us neither know nor care for the difference. But, sir, they should know, and it is by such men as you, who have the lead, that they should be taught. I must at present follow, and perhaps my employer may dictate, but he shall never force me to compile mongrel edifices of his own bad taste, the shame of which must for ever attach to me. No, sir, even I, with whom commissions are rare compared with you, would throw up any rather than be so shackled; but it is for such as you, sir, to point out even where you can't reform, and where you cannot lead, reject. The Surveyor-General, the architect of the Prince Regent, will be followed; his taste, good or bad, will for a time be in fashion; therefore the style you adopt is of more consequence than may at first appear.

A Doric, I grant, is a Doric, and an Ionic an Ionic, whether from the Parthenon or the Colosseum, whether from the temple on the Ilyssus or the theatre of Marcellus, from the Temple of Concord or either of the temples of Minerva Polias. But Roman architecture, the Roman heresy, I would call it, knows neither; those mongrels which they have dignified with these names are like children stolen by gipsies, disfigured and misnamed. That there is a difference let the discerning judge, and it will require but a slightly practised eye to discriminate; it is as great and as distinguishable as the flavour of wines to

the refined palate, as the racy flavour of champagne or Burgundy, or the delicate shades of difference between the Château Margot and the Vin de Grave, contrasted with the lusty flavour of old port and hock, or the mawkish insipidity of elder or of currant wines. To such refined, unvitiated, or naturally pure tastes I would refer the cause, for I would no more submit to the opinions of one of Batty Langley's bench-mates for pure taste in fine art than choose wines on the taste and recommendation of a dram-drinker. To such refined tastes I appeal, even if they know no more of the art than to distinguish at sight an ovolo from an echinus,* which, it would appear to your friend just mentioned, are synonymous in use and therefore in beauty. Let us compare the Doric, that is, of any pure Greek specimen of their best days—(for instance, of the Parthenon, the Theseum, or the Propylea, all differing in dimensions, proportions and members, but not in character, in which most essential quality lie the errors of the Roman school)—with the very best of the Roman pseudo specimens—suppose yours on the south side of the Opera House; or for the Ionic compare the pure example from the little temple on the Ilyssus, near Athens, with the one which you have used opposite Carlton House, to say nothing of the omissions you have made of essential component parts and grand divisions of the order, without referring to even more splendid, though not more characteristic or beautiful examples of the temples of Minerva Polias or the Erechtheum at Athens and others. Again I would ask, can you prefer the Roman egg and anchor so elaborately laid down and geometrically explained by Gibbs and Batty Langley, to that of the more ancient, more beautiful, but later known specimens from Athens, the princely prototype of the Roman mongrels?

Chambers you may say, and Wren, perhaps you may add Palladio and Perrault, all used, beautified and simplified the Roman; true, but they had not seen nor known the Grecian. They selected the most beautiful of the known specimens, they divested them of the extraneous ornaments of the Colosseum, of the Theatre of Marcellus, of the Temple of Concord, and made them approach the simplicity though they missed the character of the Greek. No two things differ more than the Greek and Roman creed of the orders; beautiful spirals, lovely contours composed from ellipses, parabolas, hyperbolas and other conic sections, selected from the higher mathematics by the greatest mathematicians, compose all the parts of the one; clumsy quarter-rounds, circular and bolstered cima rectas and reversas, struck by a pair of carpenter's compasses, the other; the geometry of Euclid was as incapable of improvement by any of his successors as the architecture of the days of Pericles by the mechanics of the time of Marcellus, Trajan, Constantine or Diocletian.

Your crime, sir, for it is a crime in the realms of art, and a misdemeanour against good taste, is that of raising the Roman heresy from its just excommunication to the detriment of Grecian orthodoxy.

One of the admirers of your style asked me lately whether I would prostrate myself and blindly worship the Greeks, when a due admixture of the aridity of the one with the profusion of the other would give so much more elegant a result, as, for instance, a Grecian Doric column with the Roman Attic base? Such was his phrase, which is part of the phraseology and nomenclature of the Batty Langley school. If this were true, if such an union would produce such an effect and such a superiority, I would fall down and worship him. No, sir, never was there a more unnatural union proposed; this would be to be wedded to a corse; oil and vinegar have a greater affinity; it would be to encase a diamond in lead:—

Non possum ferre, Quirites,
Græcam urbem.—Juv. "Sat." iii.

Wren and Chambers, it has been said, were men of a refined taste, and the latter had seen enough of Grecian architecture justly to abandon such an ancient absurdity, such a primeval baldness, and to attach himself to the later improvements of the Romans. Yes, what had he seen? Perhaps only the delusions of Piranesi for the former, contrasted with his exaggerations of the latter. This artist, with all his talent and genius, has deceived many a warm imagination, and brought an unmerited contempt on the sterling and magnificent ruins of ancient Rome:—

Roma quanta fuit ipsa ruina docet.

Or perhaps he learnt his Greek through the pert Frenchman Le Roy's inventive blunders of the remains of Athenian Greece. Let it be remembered that Wren was not regularly inducted in architecture as a fine art, although as a science it had opened to him all its riches; he was perhaps the greatest mathematician and constructive architect of modern times, of which the

* It may, perhaps, be necessary to explain to the unprofessional reader that the echinus in Greek architecture (which is the contour of a parabola, or some similar figure) is always altered in the Roman style to an ovolo, or quarter-round, as the bench-mates call it.

mechanism of St. Paul's Cathedral, one of the most perfect models of construction in existence, the spire of Bow Church, the little beauty of St. Dunstan's-in-the-East, the turret-crowned towers of St. Michael, Royal College Hill, St. Stephen's Walbrook, and Garlick Hill, among many others, are incontrovertible proofs. Wren, a mathematician, an astronomer, a natural philosopher, a scholar, an amateur in architecture, was wisely selected to fill the very important office of His Majesty's Surveyor-General; knighthood became necessary to divest him of his learned title, and to convert Dr. Wren into the more courtly Sir Christopher; and study, he felt, was as necessary to change the able mathematician into the tasteful architect, and on the solid foundation of his skill in science to raise the edifice of a pure taste in the fine arts. This his intelligent mind and great self-knowledge well knew; he therefore prepared himself for his new vocation, and learnt from Vitruvius to seek for purity of style in ancient Greece, which he proposed visiting after Rome. Without this visit to the land of taste, elegance and sound principles his great and productive mind would still have succeeded; but he commenced his proposed travels, and unfortunately reached no further than Paris, where he contaminated his style with the puerilities of the French modification of the Roman school. From Paris he was ordered home, in consequence of the Fire of London, to rebuild the desolated city, and hence all his works partake of the French school. Here are subjects for reflection: had Wren—the highly-gifted Wren—visited in those days and studied the Parthenon, with Phidias for his guide, with Stone* for his builder and Gibbons* for his carver, what would not our Metropolis have boasted now? what would not have St. Paul's, with all its excellences of design and execution have been, had to all these excellences been added the purity of taste of the architecture and sculpture of Athens? He would have been the greatest architect the world ever knew. Yet this dawning of taste, this bright sunshine of purity, you would cloud with the mists of Scamozzi and the Italian school. You would render null and void the labours and rich importations of Stuart, Revett, Pars, Wilkins, Smirke, the invaluable accession of the Elgin Marbles, and go back to the days before we were blessed with their knowledge. But to return. In construction, in invention, in skill, in science, Wren stands pre-eminent, but in the fine arts, in taste, in decoration, he by no means excels. What can be excused in him cannot be pardoned in a Surveyor-General of the present day, nor should the clumsy ponderosities of the Roman school or even the purer taste of Chambers, who may be called the Palladio *reformato* of his day, nor designs that would scarcely admit their author as a probationer, much less a student, in our ill-constructed and worse-governed Royal Academy, be now seen issuing from the office and backed with the authority of His Majesty's Surveyor-General.

Such, sir, are the undisguised sentiments of one who highly respects you in every respect, but has a greater value for the fine arts of his country.—I have the honour to be, sir, your very obedient servant,

PHILOTECTON LONDINENSIS.

It will be observed that the criticism comes from a purist in detail, and leaves untouched the general flimsiness of Nash's work. Where a whole range of buildings is only mock Classic, would much have been gained by the introduction of mouldings copied from Greek buildings?

THE PROPOSED DESTRUCTION OF PHILÆ.

IN the *Manchester Guardian* of Monday we find the following remarks by Mr. W. St. Chad Boscawen concerning the fate of Philæ:—

The decree has gone forth that Philæ, "the pearl of Egypt," "the ever-praised but never sufficiently praised" island, shall disappear. In sober fact, the commission appointed to report upon the best site for the vast reservoir which is to store the life-giving waters of the Nile and make a garden of Upper Egypt, as the Barrage has of Lower Egypt, has reported in favour of the dam being made at the island of Shelleh, a few yards above the first cataract. By this means the level of the river will be raised to a height of several metres, and at high Nile the vast superfluity of water run into a reservoir which will fill the "summer canals" of Upper Egypt and enable cultivation to be carried on during the summer as well as in the winter and spring. Whatever may be the capable output of this water store, and it will require some three to four thousand million cubits of water per annum, the rise in the river will be of such a character as to flood to a considerable depth the beautiful island of Philæ and its temples. This may in some degree be modified, as Colonel Ross, R.E., has suggested, by making the rise more gradual, but this remains to be seen. Still as the project now stands the order is "Perish Philæ." To the traveller who has toiled up the Nile, especially if personally conducted, wearied with the endless panorama of half-

inspected temples and tombs and his ears ringing with the drone of the parrot-like dragoman, Philæ is a paradise. To the ancient Egyptians of centuries ago it must also have been the same; hence its name, Pa-alek, "the end, the termination," for it was the end of the pilgrim's voyage who had come from the north to visit the sacred home of Isis. It was the end in another sense, for it was here that Egypt proper ended, and beyond was the dark continent; so hither came the armies bound south to fight against the Ethiopians, to sacrifice for fortune. Those who have seen this island of temples can well understand how the ancient Egyptians made it the home of the lovely Isis. It is without doubt the most beautiful spot in the Nile journey. Here the blue rainless sky, the rippling river rushing on to the torrent of the cataracts, the waving palms and rich verdure combine with the stately ruins to form a picture which has inspired the brush of many famous artists. The Egyptians, ever sensible to the beauties of nature, placed here the grave of Osiris and the temple of the weeping Isis. From the earliest times, certainly those of the twelfth dynasty, the island was a place of pilgrimage, but it was not until later times, until the period of the revived empire under Nectanebo II. (B.C. 287), the contemporary of the Persians, that the great Temple of Isis was built. The buildings of Nectanebo are not very extensive, but are of great interest to archaeologists. The small hypostyle vestibule at the south end of the island, near the pilgrims' landing-stage, is curious on account of its assumed ancient style. Outside of this pavilion formerly stood two sandstone obelisks, one of which was removed by Belzoni and is now in the garden of Kingston Hall, Dorset. In addition to the inscription of Nectanebo, it bears a petition to Ptolemy Euergetes II. from the priests, complaining of the too frequent royal visits and the expense they entailed on the poor temple revenues. It is, however, to the Ptolemaic dynasty that Philæ owes most of its beautiful buildings. The most important of these are the Temple of Isis and the fine pylons leading to it. This temple was built by Ptolemy VII. Philometor, B.C. 181, but there are many later, down to the time of Tiberius, A.D. 14. This temple is called the birth-house (Meshen), and similar chambers are found at Edfu and Denderah. This is by far the most interesting portion of the temple. Here we see all the scenes connected with the birth and nursing of Horus. In one scene we have the infant child Horus born in the presence of the great gods, Amen and Thoth, descending from the lotus flower. In another we see a goddess, probably Isis, nursing the child, while Hathor, the patroness of birth and fairy godmother of the Egyptian pantheon, is patting her hand affectionately on the child's head. The presence in the groups of Ptolemy IX., who stands beside Hathor, and of his sister and wife, Cleopatra I., shows that we have here really, blended with the old Horus myth of Egypt, the according of divine protection to the new-born Pharaoh. Not only have these sculptures preserved a Ptolemaic myth, but they have furnished the basis of a curious modern Arab legend. The curious story of Anas-el-Wogud, the beautiful youth who pursues the beautiful but ever-fleeing maiden Zahr-el-Ward, "the Flower of the Rose," is located at Philæ. Like Osiris, he comes to the island on the back of a crocodile; here the mummy of Osiris is represented carried on the back of a crocodile. Here the lady escapes from her prison, where her father had hidden her, by a rope made of her clothes. Eventually they meet, and are married with the paternal blessing, and, as the Arab writer poetically puts it, "So they lived in the bosom of happiness to an advanced age, in which the roses of enjoyment shed their leaves and tender friendship must take the place of passion." According to Arab tradition the birth-house already described was their bridal chamber. Surely it will be a pity to lose so interesting a chamber, the centre of so many poetic legends.

It is impossible in the limits of a single article to describe the many points of interest in this great temple. One other room, however, must be described. This is the small cella and vestibule on the west of the Hypostyle hall. Here we have Horus receiving the waters of life from Isis and Nephthys after his birth, and Thoth writes his name on a palm leaf. But of more interest is a sculpture which may be called a very early example of landscape, in a scene representing the rising Nile. There we see one of the cataract islands, with its rocky cliffs, with a cave in its lower part. In this is the figure of the Nile god holding two vases in his hand and guarded by a coiling serpent. From the vases flow the two streams of the river. Above are the vulture of Muth and the hawk of Horus keeping guard, and below the inscription "The very distant and very sacred who rises in Senem." There is one other building in this beautiful island which we shall miss with regret. It is the beautiful little kiosque known as "Pharaoh's bed." This beautiful open pavilion chapel of Hathor is known to all who have visited the island. It is a work of very late date, being of the time of Nerva Trajanus. Here, in evidence of Greek art, we see, as Ebors remarks, as it were "a line of Homer among the hieroglyphic inscriptions." The kiosque is perhaps the best known part of Philæ, painted by thousands of artists,

* The master mason and principal carver of St. Paul's.

visited by thousands of tourists, the scene of many a merry luncheon party. It will indeed be missed with deep regret when submerged beneath the waters of the Nile. The order "Exit Philæ" will no doubt cause much regret and some indignation among archaeologists and artists who know Egypt; but let them remember what the work to be undertaken means. It means new life to Upper Egypt, it means the conversion of thousands of acres of desert land into a garden, it means Egypt freeing herself from the mountain of debt which has crushed out all her life. If it is to be as the commissioners decide, let us rescue all we can of this beautiful temple. Some suggestion has been made of rebuilding the ruins elsewhere. This is on the face of it absurd. Certain chambers, such as those mentioned in this article, might be removed, and the "Pharaoh's bed" also. What should be done is that a thorough exploration of the site should be made, and casts taken of all that is worth keeping, and then we must bow the head as the sacred river closes its waters over the home of Isis and once for all "Exit Philæ."

ARCHÆOLOGY IN BERKS.

THE annual report of the Berks Archæological and Architectural Society states that the past year has not been marked by any events of exceptional importance. The restoration of the ancient Hospitium at Reading, now used as the University Extension College, has been effected under the careful and able superintendence of Mr. S. S. Stallwood, architect, but the committee regret to observe that the corridor, which was to have been constructed as a memorial to the revered memory of Mr. W. I. Palmer, formerly president of the College Council, by the working-men of Reading, has been abandoned for the present through want of funds. No other building deserving of special attention has been erected during the year within this district. One church of note—that of Lambourne—has been almost completely restored, and it is earnestly to be hoped that the proposed addition to the municipal buildings at Reading may redeem the architectural mediocrity of their other portions. The excavations at Silchester are still in progress under the direction of the Society of Antiquaries, and we are glad to report that substantial assistance has been rendered in Reading to this undertaking. The publication of the registers of the ancient parish church of St. Mary, Reading, undertaken by the Rev. G. P. Crawford, a work of considerable value to the local antiquarian and genealogist, has now been completed, and it is proposed to undertake, in continuation, the registers of St. Laurence's Church, Reading, dating from 1603. It is probable that the Parish Councils or Local Government Act recently enacted may raise the question as to the proper custody of these valuable parochial documents. We strongly deprecate their removal to a metropolitan centre, like the Record Office, and are inclined to support the proposal that, if removed from their present custodians, they should be preserved in a special county registry, under the care of the County Councils. Notwithstanding the long and serious illness of the valued secretary, the Rev. P. H. Ditchfield (from which he has now happily recovered), the Society has pursued its threefold object—(1) of contributing papers on architectural subjects and the personal inspection of historic sites; (2) the encouragement of architectural and historical study; (3) the publication of original articles in the *Quarterly Journal*. The Society has endeavoured in every way to fulfil the duties entrusted to them by the Corporation of Reading in committing to their charge the Abbey Gateway, a most interesting relic of our ancient abbey at Reading. A large number of visitors, including several Americans, have been conducted over the abbey ruins and allowed to inspect the gateway. The officers of the Society are prepared at any time to give a hearty welcome to schools or parties of working-men who wish to be conducted over the ruins. Inquiries are frequently made by strangers for information concerning the abbey and other antiquities of the town, which entail a considerable amount of correspondence from our official headquarters. In addition to these duties it is our endeavour to utilise the large room over the gateway as much as possible for educational purposes. It should also be mentioned that the Society has furnished the Corporation with the necessary information respecting the detailed portions of the abbey buildings so as to affix notice boards for the guidance of strangers. The usual prizes have been awarded by the Society for an historical essay and for proficiency in architectural drawing. It has not been found practicable to grant any donations during the past year towards the restoration of public buildings, but the Society has contributed a small sum towards the Silchester Exploration Fund, and has also made some small additions to the reference library. The stationary condition of the library is the less to be regretted because an important section of the public library is now devoted to works of a local character. The Society cannot omit this opportunity of expressing its obligation to Mr. W. H. Green-

ough for his unceasing efforts to make the local collection as complete and as full as possible. A valuable collection of manuscript notes, compiled by Miss Thoyts, has recently been added to this section of the public library. The articles in the *Quarterly Journal* have been of unusual interest and the circulation of the journal has considerably increased. The inventory of church plate, conducted by the Rev. E. R. Gardner and Mr. A. J. Dasent, is in progress and will probably be published as a separate work. There is a slight decrease in the number of members of the Archæological Society on our books as compared with last year. The financial position is more satisfactory, although a small balance of 9*l.* 9*s.* 6*d.* is still due to the treasurer.

IRISH GEOLOGY.

A LECTURE has been delivered on the "Scenery and Geology of the County Cork" by Mr. J. Porter, B.E., to the members of the Cork Literary and Scientific Society. He said that when they glanced at the geological map of Ireland the first thing to catch their eye would probably be that bright patch of crimson which marked the volcanic rocks of the north-east corner, and apart from the colour effects of the map-creator there was undoubtedly something impressive in the spectacle of a country, which had been overwhelmed by the fiery deluge. Even when the lava has become frozen into rigidity and exposed to the weather for many centuries it still maintained in its rugged outlines the constant suggestion of subterranean heat. But it was not the land of the Giant's Causeway which was to engage their attention that night, but they should go to the other end of that measuring line which in their school days they were taught to draw from Fair Head in Antrim to Mizen Head in Cork. The more tranquil geological history of the premier county might possess sufficient interest to repay them. The south-western highlands of Ireland were marked on the geological map by a peculiar drawing out of the colours into a series of bands running nearly east and west, which arrangement did not by any means stand by itself. On the county map of the Ordnance Survey they would notice the east and west direction of the main valleys, rivers, and lines of communication, the alternation of long and narrow peninsulas, with equally long and narrow bays. It would be their main business that night to connect these peculiarly marked features of the ground above with the structure of the rocks beneath. With the exception of such superficial deposits as sand and gravel and soil, all the rocks of County Cork belonged to the older divisions of the geological series. The index of age in the case of stratified rocks was found in the character of the fossils which they contained. These guides had led to the following classification of the Cork rocks:—Coal measures, carboniferous limestone and slate, Kiltorean beds, old red sandstone, Dingle beds, Lower Silurian, volcanic rocks. The Lower Silurian rocks were only represented by a tiny patch in the north and would not engage them any further, but the Dingle beds, as shown in brown on the map, covered more ground than many of the others. Their name was derived from the peninsula in Kerry where their relations to the other rocks could be best seen. They consisted of a series of shales, grits and conglomerates, rocks made of hardened mud, sand and pebbles. Their thickness varied from 3,000 feet in the east of the county to 10,000 feet and more among the Cabra Mountains in the west. Their exact age was yet a matter of doubt, for the fossils were few and ambiguous in their testimony. They had a small area in the north-east of the county, which is occupied by rocks of undoubted old red sandstone age. The Dingle beds were formed under water, like all other stratified rocks, but great changes took place in the sea-floor after they had been deposited, and they were slowly raised into the region of the air, where no further deposit was possible, but where, on the contrary, there was

The sound of streams that, swift or slow,
Draw down Æonian hills, and sow
The dust of continents to be.

The southern half of the county was afterwards submerged and covered by the deposits which were formed in a large fresh-water lake which extended eastwards beyond Kiltorean, in the county of Kilkenny, but the northern portion remained above the water level, and only sank as the carboniferous period was ushered in. There could be no doubt but that the coal measures formerly extended far to the south. Small patches, the remains of a once continuous sheet, were to be found near Ballinhassig, Bandon, the Old Head of Kinsale and Bantry Bay. The Bandon coalfield actually yielded some coal, but the agent of the Duke of Devonshire rather unnecessarily stopped its working. The essayist then proceeded to deal with the arrangement of the stratified rocks in Cork, showing their wavy structure very clearly. There were two reasons why the rocks of the country had not been reduced to masses of broken skivers during the upheaval. The first was that the great earth below, which constitutes the mountain range, is formed with extreme slowness, and the most subtle substances could be

bent, if only time enough was given them. The second reason was that the load of rock overhead, which had since been stripped off, exerted at the time a pressure so heavy that fracture was rendered difficult. When they examined the geological map of the county they found that with a few exceptions all the higher ground was composed of the Dingle beds. Owen Hill, which stood unapproachably among the mountains of Cork for beauty of form, was carved out of an arching fold of the Dingle beds. Cullenagh Lake, from which the infant Bandon river emerges, suggested to them in the wooded mountain which overlooked it something of what Gougane Barra must have been when the name Dereen, included in half the townland names of the district, was not a misnomer, and the foliage of the oak trees on every hill-slope lent by its deeper hue to the charm of contrast to the vivid green of the valley of Desmond. The highest mountain of the Dunmanway group was next described. The great longitudinal valleys in the south of the county which contained the main waterways, the principal towns and the chief lines of communication, were all floored with the dark slope, the dividing ridges between being formed of anticlinal arches of the more enduring kind. Dingle beds, volcano rocks and land sculpture were interestingly dealt with. In continuation the lecturer said:—Now, to pass from single streams to river systems, there was a process at work in all countries, but specially marked in those where the folds of the rocks were nearly parallel, which tended to concentrate the drainage into a few systems. Its working was much too long and complicated to describe, and he would simply remark that its result had been to divide the drainage of the country into the transverse streams which formed the sides of the great east and west ridges of the longitudinal streams which run for miles in an east and west direction, and received the contributions of all the transverse ones. The Blackwater, for instance, received the discharge of a score of separate fair-sized streams during its course across the country in its great longitudinal valley. There was also a process of amalgamation going on in all river systems which tended to reduce the number of streams to a few. That process went on much more rapidly where the slope of the surface was low than where it was high. They now came to a point of great importance. Suppose two transverse valleys on the opposite slopes of a ridge chance to head directly back towards each other, the result would obviously be to make a gap right across the ridge in the course of time. Such gaps were numerous among mountains, and to them was due the cutting up of a ridge into separate peaks. From the outline of the Sugarloaf they could see that its true form was that of a ridge which three or four pairs of torrents had cut up into peaks. The Clyda and the Martin rivers were jointly responsible for that droop in the main watershed of the county through which the Great Southern and Western Railway line had been carried. The road from Macroom to Millstreet was led through a glen whose summit elevation was only 700 feet, while Mushramore rose immediately to the east to a height of over 2,000 feet, and Musherabeg, on the west, reached nearly 1,600 feet. There was one valley which had always appealed to observers with a peculiar fascination—the pass of Keamaneigh. Its primeval wildness recalled the time of bonnought, kern and gallowglass, and its gloom was in keeping with that tragic story of a wifeless and childless old man killed by a reckless pistol-shot. The county of Cork was but on the fringe of the great ice-sheet. The mountains of the west bore frequent testimony in the smoothing of their rocks to the passage of the glacier. The hills of lower elevation owed the final touches of their rounding to that agency. The limestone showed few of those castellated rocks so common on its surface in countries which the ice-sheet had not invaded. Striking as were some of the evidences of glacial action, the chief instrument in the land sculpture was water and not ice. Through every variation in the coast-line where the low cliffs of marly clay at Youghal were swept away in huge masses by every winter storm, or where bay and headland and skerry attested the power of Cleena's wave as it broke in foam against the rocks of Sheela, there was the universal impress of water. The smiling plains of the east owed their existence and their fertility to the brooks which flowed

By many a field and fallow,
And many a fairy foreland set
With willow, weed and mallow.

But the descriptions of the poet born and reared amid the luring streams of the Fenland are out of place amid the mountains of the west. Their gloomy defiles and torrent-scarred slopes called up rather visions of the Gaelic warrior bard as he gives utterance to the voice of

Turthon's stream,
That sent its sullen roar by night
Through Gormal's misty vale.

A Collection of views of Birmingham in the early part of the century is now on view at the Municipal Art Gallery.

TESSERÆ.

The Chambered Tumulus of Maeshowe.

WHEN in 1861 a deputation from the Society of Antiquaries of Scotland penetrated to the central chamber they found it covered with Runic inscriptions, most of which were apparently engraved by pilgrims from Norway, who had landed in the Orkneys on their way to Jerusalem, it is generally supposed in the twelfth century. Owing partly to the indistinctness of the record, partly to the difficulty of deciphering short detached sentences, what they tell us of the history of the monument is by no means satisfactorily determined. A fair inference, however, from the whole seems to be that it was raised in honour of, or for the burial-place of, the sons of (Regnar?) Lothbrock, by Ingibjorg, his (?) widow. If this were so, it would place it a century earlier than the tombs of Gorm and Thyra at Jellinge, which it resembles in every essential respect except one. The Danish monument being erected in a country abounding in wood and where stone was scarce, the chamber is formed with timber. In the Orkneys, on the contrary, timber does not exist, but stone is found everywhere, which splitting easily into rectangular blocks with smooth faces is most suitable for the purpose. Bearing this distinction in mind, the comparison of the two monuments with the whole aspect of the place and its inscriptions seems to place it almost certainly in the first half of the ninth century. The pilgrims being Christians would have no hesitation in breaking into and plundering the sepulchres of their pagan forefathers; but they would hardly have chosen it for the place of such elaborate engravings if they had not known that it belonged to their own people. Whatever inference may be drawn from these facts, there is a figure of a dragon on the right hand facing the entrance which may go far to settle the question. That it is Scandinavian no one doubts. There is a similar dragon on King Gorm's stone at Jellinge, and another at Hunestad, in Sweden, which may belong to the eleventh century, but both these are undoubtedly more modern than the Maeshowe example. This last therefore could hardly have been engraved by the "Iorsala farers," as the Jerusalem pilgrims call themselves, but would suit perfectly to the theory that the Howe was erected by the Lothbrocks, or belonged to their age.

The Academy of Siena.

The old "Università de' Dipintori" of Siena, though probably the most ancient of all modern academies, was, perhaps, the most arbitrary and exclusive. Family tuition, if apprenticeship may be so called, was the only species of instruction then adopted; but every youth, before he could be admitted into apprenticeship, was obliged to swear always to keep the statutes of the corporation, and to abide by the decision of the rector, who had authority to impose fines in all cases of misdemeanour, and had also the power of expulsion from the community, in which case the expelled could not practise his art in the territory of Siena. These powers were awarded by the State in the Breve, or deed of incorporation, and could not be resisted. No stranger could practise his art in Siena without a special license from this society; the price of the license was a gold florin, and it appears to have been valid only for the particular engagement, or at least visit, from which it was granted; but a stranger might be received as a member into the society. The society of sculptors was distinct, but was similarly constituted. All members of these societies were eligible to fill the offices of their signoria or government in rotation. The rector, or rectors, were assisted by a council of thirteen members, three of whom were the rector's counsellors; and each society had also its treasurer, who was at the same time its secretary. The offices were held by election, for six months only; it was not allowed to vote for your own relation or partner to fill the office of rector, and no member was re-eligible until after the expiration of three years. The officers were paid for their services; the rectors received twenty florins each, and the treasurers fifteen. The society of sculptors had three rectors. All disputes or doubts relating to the estimation of work done or contracted for were settled by the signory of the society; it appears even, from one part of the statutes, to have regulated the price of all work and to have levied a tax upon the amount, which, of course, was really paid by the employer or purchaser, as a proper allowance would be made for the tax in the estimation of the work. The highest fine mentioned in the statutes is forty florins, something less than four pounds, but this in the thirteenth century was a very large amount. For disobedience to the rector the fine was ten florins; the large fines were provided against a breach of trust of the rectors or treasurers. The following instance will serve to show the value of money at this time:—In 1296 a painter was paid, at Siena, only six lire, about five shillings, for painting a figure, most probably in distemper, of St. Christopher, in the court of the signory house. The other old company of St. Luke was very similarly constituted to this of Siena.

NOTES AND COMMENTS.

THE Town Council of Crieff may be considered to have received a snubbing from the Board of Supervision, which is almost as important as the English Local Government Board. The offence which was the cause of the reproof is not uncommon of late years in all parts of the country, for it was one of those cases where a local body shows indifference to other bodies no less respectable. An offer to build a hospital for infectious diseases was accepted by the Town Council. The site assigned for the building was in front of a Board school. Naturally the Board, the relatives of the children, and the proprietors of the neighbourhood appealed for protection to the Board of Supervision, as the Town Council remained obdurate. After hearing all parties, it has been decided that it would be inexpedient to have the hospital erected on the site proposed. The Board of Supervision suggest that the Town Council would do well to consider whether, in the interest of the burgh itself, it would not be advisable, in selecting a site, to have regard to the objections which have been taken to the present site by a large section of the community. In other words, it is not advisable for town councillors to imagine that they are the only authorities to be satisfied. It would be well if in London the advice was likewise accepted.

THE report which Mr. W. MATHER, M.P., has prepared on the year's experiment of working forty-eight hours weekly, which was tried at the Salford Ironworks, is an important document in the history of industrialism. From time to time experiments of the kind have been attempted, but on a small scale. The report relates to one in which the conditions were as perfect as any economist or statist could desire. In the Salford works about twelve hundred men were employed, comprising pattern-makers, moulders, (iron and brass), smiths, coppersmiths and tinplate workers, engine-fitters, millwrights, electrical mechanics, turners and fitters, brassfinishers, boilermakers, planers, drillers, borers, machine-tool men and labourers. The character of the work turned out during the year of trial was similar to that of the preceding six years, viz. general engineering work, in which are comprised engines, pumping machinery, boiler-work, &c., machinery used in the textile trades (other than spinning and weaving), for the bleaching, printing and finishing of cotton, linen, silk and other fabrics; electrical machinery of every variety for lighting, transmission of power, electric traction, electro-depositing, electro-chemical processes, &c. It will be evident that an experiment with such elements deserves to be considered as convincing. The conclusions are drawn impartially and with precision. The comparison of net value of production with the wages paid is against the experiment, but only to the extent of 0.4 per cent. On the other hand, allowances for wear and tear are in favour of it, and they exactly balance the wages loss, being 0.4 per cent. "Lost time" brings 0.2 to the same side. Piecework does support the diminution of working hours, for the production was reduced as well as the earnings. Mr. MATHER concludes that the wages cost of production in the forty-eight hours system remains the same as it was under the fifty-three hours system, when the new system is credited with the saving in consumables, wear and tear, fuel, &c., which is the direct consequence of the change without diminishing the output of the works. The pieceworkers have lost slightly on the year, but the later months show this loss to be a vanishing quantity. A curious fact is illustrated by the pieceworkers' statistics. The diminution in their total wages means a proportionately less production in actual work turned out by them. But as the total output of the works during the trial year was greater than that of previous years, the diminution in the production of the pieceworkers must have been more than compensated for by extra production on the part of the dayworkers. Mr. MATHER is most eager to have the forty-eight hours' principle generally adopted in this country. He testifies to the persistent industry of the workmen, and he believes that the experiment has improved their home life. Finally, he says, "Of this I am assured, that the most economical production is obtained by employing men only so long as they are at their best. When this stage is passed there is no true economy in their continued work. Our year's trial has

convinced us that we have found the 'happy medium' in the number of hours during which only one meal and one stoppage are needed, and this resolves itself into the eight-hour day or forty-eight hours week."

CAREFUL observations have been taken by Mr. J. W. L. STEBBINS, C.E., in order to ascertain whether two of the tallest buildings in Chicago were affected by the force of one of the late gales, the velocity being at the rate of over 80 miles an hour. The Monadnock building is 182 feet high, and the Pontiac building 175 feet. Both are examples of the employment of steel as a building material, and they might be considered as compound girders placed vertically. It was found that in the Monadnock there was deviation from the perpendicular to the extent of half an inch, while in the Pontiac the utmost was three-sixteenths of an inch. The vibration of the two buildings was therefore of little account on the score of danger, and from the character of the construction it may be assumed that no permanent "set" followed the storm. The Chicago buildings may be unsatisfactory to the æsthetic sense that has been trained to judge by Greek temples, picturesque cottages and the like, but there is no fear about their ability to withstand all the power the American BOREAS can combine.

THE English reports, we imagine, do not contain a case exactly corresponding with one which is before the American Courts. It relates to an architect's certificate, or rather to the absence of one under novel circumstances. The plaintiff is a builder, and he claims 6,158 dols. as balance of a contract. He was not, however, provided with the final certificate of the architect, which by the contract deed was necessary. The statement of claim did not mention that it was unreasonably withheld. On that account, when the case was tried, the judge nonsuited the plaintiff. It so happened that the defendants took the contract out of the hands of the plaintiff and completed the building. This made a change in the character of the action, and plaintiff was advised to raise an appeal on it. The Court of Appeals heard the arguments, and came to the conclusion that the judge in the Court below was in error, and that a new trial must take place. The decision was based on the fact that the defendants having undertaken the completion a final certificate was no longer a necessity. The object of that document was to satisfy an owner that the works agreed for had been duly performed. But when an owner takes up a part of the work it is manifest, without the aid of documentary evidence, that the agreement is not fulfilled. The arrangement to be accomplished, then, becomes simply a balancing of accounts. Both parties have a right to the investigation of claims and deductions. The production of a final certificate no longer becomes a condition precedent, and on that ground the judgment given in the Superior Court of New York was reversed. It will be observed that although the architect ceased to be recognised as arbitrator, not a word was said to diminish the importance of a certificate. Circumstances had drifted the parties into a new relation in which it was no longer indispensable; that is, according to the opinion of an appeal court. As an architect is not supposed to be in a position to grant a final certificate until the works are completed (by English law he cannot assess the value of deductions without special agreement), we cannot understand why the Superior Court should suppose its absence was due only to negligence.

It is a sign of the times when we find the members of the Brighton Debating Society discussing such a subject as the following:—"That, in the opinion of this House, it would be to the best interests of the inhabitants of the town of Brighton if the Corporation carried out all works of public utility and convenience without the intervention of a contractor and by the direct employment of their own workmen, thus insuring a higher standard of efficiency and a saving to the ratepayers in the cost of such works." Of course the resolution was adopted by a large majority, for the contractor is fast losing his friends, not only in Brighton but in most towns. He is supposed to have become a millionaire far too quickly to please the ordinary shopkeeper.

FIGURE FROM ALTAR-PIECE.
CHURCH OF OUR LADY AND ALL SAINTS', STOURBRIDGE.
Painted by L. FAIRFAX MUCKLEY.

ILLUSTRATIONS.

FIGURE FROM ALTAR-PIECE IN THE CHURCH OF OUR LADY AND ALL SAINTS, STOURBRIDGE.

THIS illustration has been reproduced from a large pen-drawing by Mr. LOUIS FAIRFAX-MÜCKLEY, from his altar-piece painted in the above-named church, representing a choir of angels praising the Annunciation lily, the emblem of purity and of the promise of our SAVIOUR'S birth.

It will be evident that the style of the work differs from what is generally adopted in modern church decoration. More character has been imparted to the figures and conventional prettiness is avoided. It is satisfactory to find that some clergy are ready to approve of a treatment which the artist can claim as personal, and which does not compel him to walk in the groove which was supposed to be compulsory on everyone who attempted ecclesiastical art. The experiment by Mr. FAIRFAX-MÜCKLEY is therefore one which demands attentive consideration from everyone who has a care for the future of the highest class of art in England.

TYNTESFIELD, BRISTOL.

NEW MINERS' HALL, SILKSWORTH, NEAR SUNDERLAND.

THIS building contains on the ground floor a large assembly hall, with gallery and recessed platform, also reading-room, committee-rooms and retiring-rooms; on the first floor, billiard and recreation-rooms. The elevations are carried out in red bricks, with stone dressings and carvings. The roofs are covered with Westmoreland green slates. The cost has been about 3,400*l.* The architect is Mr. HENRY GRIEVES, A.R.I.B.A., of South Shields, and the contractor Mr. T. P. SHAFTOE, of Sunderland.

NEW BOARD SCHOOL, SOUTH SHIELDS.

THIS school will give accommodation for 490 scholars, and contains on the ground floor a large school-room, two classrooms, teachers'-room, cloak-rooms, &c., and on the first floor a schoolroom, three classrooms, teachers'-room and cloak-rooms. The two schoolrooms are fitted with sliding partitions, and can each be converted into two classrooms when required. The elevations are of red brick, with stone dressings, &c. The roofs are covered with Welsh slates. The cost will be about 3,500*l.* The building will be heated throughout by hot-water. The architect is Mr. HENRY GRIEVES, A.R.I.B.A., of South Shields, and the contractor, Mr. W. CHRISTIE, of the same town.

PICTURESQUE BUILDING.*

PICTURESQUE buildings appeal to the hearts of all of us, to the everyday Englishman and Englishwoman as much as to the painter and the poet, the architect and the builder, and the subject therefore appeared to me eminently suitable for such a meeting as this, for I do not suppose that this exhibition and these lectures will be attended only by those who are immediately concerned, as part of their daily life, in matters connected with building.

We all have no difficulty in recognising a picturesque building when we see it, but if we are asked why we recognise any particular building as picturesque, and what are the qualities which charm us, it becomes a matter of some difficulty to give a precise and clear definition of what is a picturesque building.

It is not sufficient to say that a picturesque building is one which looks well in a picture. A picturesque building does look well in a picture, but that is only because it is in itself pleasant to look upon, and hence its counterfeit presentment is pleasant to our eyes. Nor is every well-designed and beautiful building of necessity picturesque. Picturesqueness excludes the stately, dignified, majestic building; it is rarely possessed by the mansion or the palace, but is frequently the attribute of the cottage; it is absent from a bank, a warehouse or a cathedral, but is found in the country farm-house and the village church. It always speaks of contented, easy-going home life and happiness, it is foreign to the bustle and worry and striving of business. As you will see from the pictures to be thrown on the screen, picturesqueness is eminently the accompaniment of irregularity, of the unexpected, and never of the monotony of the miles of our London dwellings, the long unlovely length of street upon street of houses all alike, each with its wearisome reiteration of the same bay window, the same street door, the same venetian blinds and the same lace curtains. How much

brighter and happier would be our lives if our speculating builders would only introduce a little more picturesqueness into the houses which the circumstances of our modern life compel us to accept at their hands for our homes, and which implant such love for these homes in our hearts that we change them every three years with the regularity of clock-work. Some few instances there have been in modern times of departures from the stereotyping of pattern, and it pays. Picturesque houses let quicker, and the tenants stay longer, so that there is not the constant repetition of new decorations every three years when the houses change hands.

You will find that costly ornament and carving are quite unnecessary for a picturesque building; instead thereof, good proportion is essential. It matters not what the material of your building may be. Stone, brick and timber, as you will see from the illustrations, have all produced picturesque buildings when rightly used. It is to be noted, however, that for the most part certain materials are used in picturesque buildings in certain parts of the country—stone in the west, brick in the east, timber in various localities. I have not time this evening to go fully into this question, but you may take it from me that the material which is most suitable and most picturesque in any district is the most prevalent local material.

It is this constant use of local material in buildings of past times which does so much to give them that harmony with their surroundings which always marks a picturesque building, and without which no building can be picturesque. Another important item which assists in this harmony, and is indeed its major part, is what we architects call grouping—the arrangement of the parts of a building so that they group pleasantly together.

The examples of picturesque building that I am about to show you are all taken from old buildings of various parts of England, and whilst they undoubtedly owe part of their charm to the softening hand of time, you will observe that the principles I have enunciated are paramount. You will also note that the roofs are ample and of good pitch, whilst the windows, compared with those of our modern villa residences, are small. These are vital points in the effect which any building produces on our mind. As used in old buildings they give that delicious feeling of home comfort which appeals to the heart of all Englishmen. The ample roofs suggest protection and shelter, wide, embracing and all sufficient. The windows, sufficiently large for light, yet lead us to realise that cold and wind are kept out, that snugness is insured, and the home circle kept sacred from the too inquisitive gaze of the casual passer-by. How different is this from the absurdly overgrown windows of the modern villa, whose walls appear to be almost built of glass, each opening stretched to the extreme dimension that the law allows. And to what purpose and with what result? The picturesqueness, the beauty of our homes is ruined, the coal bills enormously swelled to overcome the chilling of our rooms by the immense glass surface. It is not for the sake of the light that we have these great yawning chasms in our walls, for we immediately proceed, or our wives do for us, to cover up the greater part with venetian blinds and lace curtains, with their increase of the washing bill. Thus we have all the inconvenience, all the discomfort and all the expense of our big windows, but we do not, indeed we could not, enjoy the advantage of the increased light, which is their ostensible excuse.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Edinburgh Association visited Sciennes School on Saturday. Mr. Wilson, the architect of the school, stated that the classrooms and lecture-rooms were designed to accommodate 1,686 children, allowing 10 square feet for juveniles and 8 square feet for infants. If the area of the gymnasium and swimming-bath were added the accommodation would be 1,990. The site extended to 1¼ acre, and had been acquired for 5,676*l.* 18*s.* 6*d.*, which sum included the expenses of purchase. The total cost of the school, including fittings, offices, playsheds, janitor's house, &c., was 21,874*l.*, or barely 11*l.* per child, basing calculations on the full accommodation of 1,990. After Mr. Wilson had explained from a diagram the arrangements of the school, and had described the system of mechanical ventilation, a tour of inspection was made, and the uses of the various classrooms pointed out, and the peculiarity of their furniture to suit requirements was noted. The visitors were much interested in viewing the gymnasium, swimming-bath, laboratories, and especially so in the carpenter's workshop, where Mr. Graham, the instructor in joinery, explained the methods of teaching and exhibited some very creditable work which had been executed by the scholars. Mr. Murray, the headmaster, then detailed the system of instruction adopted throughout the school and indicated the working arrangements. Mr. W. W. Robertson, the president of the Architectural Association, then proposed a vote of thanks to Mr. Wilson, Mr. Murray and Mr. Graham for their attendance and for the information imparted, which rendered the visit instructive as well as interesting.

* A lecture delivered by Mr. F. R. Farrow at the National Building Trades Exhibition on March 21.

THE EXCAVATION OF DEIR EL BAHARI.

EVERY Nile tourist, says a correspondent of the *Times*, knows Deir el Bahari. The "personally conducted" find it in their first day's programme at Thebes, and are required to assimilate it as best they may with a dozen tombs of the kings and two temples. Independent tourists make it the goal of a day's expedition and bring their luncheon. The jumble of walls that they have seen from a distance, clinging to the foot of a horseshoe cliff, resolves itself into an ordered series of terraces, rivalling in the freshness of their painted sculptures the best of the royal tombs, and in delicacy of relief-work any graven wall in Egypt. On these terraces Queen Hatasu raised, about 1550 B.C., a unique monument to the memory and worship of her father, Thothmes I., and somewhat to her own honour and glory, for she takes occasion to record there her own most brilliant achievements, notably the bringing of all manner of precious things from the land of Punt—Somali land, at the mouth of the Red Sea. Those wall-pictures are the most delightful among remaining historical representations in Egypt. The queen's admiral arrives at a land of marsh-dwellings and is greeted by the savage king and queen. Behind him his fleet makes the shore; the elaborate rigging of the ships already arrived and the bellying sails of those still distant form one of the happiest wall-decorations in the world. In a higher panel the ships put off again, laden with all manner of precious things, while dog-faced apes clamber and squat on the yards. In the third and highest belt of relief we see the envoys of Punt, arrived before the queen, and a long procession of their gifts—rare trees borne in tubs slung on poles, wild beasts, apes, giraffes, leopards and lions led in chains, ivory, ebony, gold and spice. The treasure is told and weighed, and finally the queen devotes it in due form to Amen-Ra, of Thebes. The sovereigns of Egypt will never live again for us in the same sense as the great of old Greece and Rome; their history we cannot write; their fragmentary annals are contained only in those most mendacious of all sources—official inscriptions. It is idle to deal with motives and minds before the birth of literature; but we may note nevertheless that the long procession of august outlines that stalk across the pylons and tomb and temple walls of Egypt is broken here and there by figures sculpted more in the round. Hebrew tradition has, of course, done much for a certain Pharaoh; Greek legend something for the pyramid-builders and the great Rameses. A kind of life has been breathed of late into the dried corpse of Amenophis IV., the idealist "worshipper of the sun-disk" at Tel-el-Amarna; and certainly about this Queen Hatasu of the eighteenth dynasty there still hangs some humanity, in spite of the three millennia and a half that divide her from our time. She overcomes by personal force the prejudices of a changeless people, and alone in the great historical period breaks the male line. The artistic brilliance of her reign seems due to her own policy of eclipsing the military brilliance of a king. By one means or another she keeps her throne, and only after many years can her mighty nephew, Thothmes III., wreak vengeance on her monuments. We know, in short, just a little more about her as a person than about almost any other sovereign of Egypt, and that precious little; and the supreme artistic merit of her work give to her temple at Deir el Bahari and its present exploration their especial interest.

Built for the worship of a dead man, like all the great fanes on the left bank of the Nile at Thebes, the temple at Deir el Bahari has no progressive national character. Successive dynasties have not altered nor enlarged it; it remains an expression of a single period, the zenith of Egyptian greatness. Its history as a building is comprised in the additions that the queen herself made to her own plans and the mutilation of her names and titles by order of her vengeful nephew; the heretic Amenophis hacked out here, as everywhere, the figures and names of Amen-Ra; here, as everywhere, the inevitable Rameses II. restored them in a style unworthy of the first hand. In neglectful times the mountain was allowed to slip and break in roofs and fill up courts. A Coptic convent, built over part of the highest terrace, added its rubbish to the mounds formed already over the lower levels. Hardly a third of the whole temple was visible two years ago, and the rest seemed doomed to lie for ever under 40 feet of earth and stones.

The Egypt Exploration Fund, however, came to the rescue in the early part of last year, and with two hundred men and a Decauville tramway succeeded in clearing the greater part of the highest terrace before the hot season began. The finds made in the process were as remarkable as unexpected. The buried north end, instead of being symmetrical with the south, as Mariette had supposed, upheld the general character of Egyptian buildings by being utterly unsymmetrical and abnormal. To balance the small "chambers of offerings" on the south there was found on the north a large hall, in the inner part of which rose a high altar dedicated to Harmachis by the queen. The displaced stones have been built in again now, and the great platform of brilliant white limestone, with its

frieze of hieroglyphics and its graduated ascent, stands almost as complete as it ever did, the only such altar extant in all Egypt. Beside it a little funerary chapel runs into the rock, its walls a marvel of brilliant colouring. During the present season operations have been carried on with a larger staff, including two artists to reproduce the sculptures for publication. Two hundred and fifty men have been set to work on the great mounds under which the northern half of the central terrace was buried, and bit by bit they are being carried away in the Decauville cars to a deep pit a quarter of a mile away. Pillar by pillar the graceful colonnade which ran round the north side and north-west corner of the terrace is emerging from the earth. Until this year not one person in a hundred who visited Deir el Bahari knew that it existed, and still fewer suspected that it ended in one of the finest painted halls in Egypt, soon to be opened to light and air.
